VOLUME XXII.

NUMBERS 1—26.

January 1—June 25, 1898.

ELECTRICIAN PUBLISHING COMPANY,
CHICAGO.

INDEX.

Accumulators, Coupling Switches for. Illustrated... 237
Accumulator Plant, Fribourg. Illustrated..194, 195
Acetylene Bicycle Lamp, Dupee. Illustrated.. 28
Acetylene Explosion, A Flood Causes..... 193
Acetylene Gas, Fear..... 25, 26
Acetylene Lamps, Portable. Illustrated.....112, 194
Acetylene Promoters, Troubles for..... 190
Ackerman's Electric Floor-scrubbing Machine. Illustrated..... 90
Adams, W. P. (A Survey of the Possibilities of Electric Heating and Cooking)..... 152, 153
Akron Multipolar Apparatus, New. Illustrated 14, 15
Aldrich, William S. (Central Power Plants on Board Ship vs. Distribution of Power)..... 180, 181, 182
Alexian Brothers' Hospital, Electrical Plant in the. Illustrated 33, 34, 35
Alley "L" Affairs, Chicago..... 84, 293, 339
Alley "L" Electrically Operated..... 293
Alternate Current Schlatter's Method of Distribution of, by Transformers. Illustrated.. ..... 294, 295
Alternator, A Home-made. By B. F. Fells. Illustrated..... 104, 105
Alternator, Warren-Mesbery Inductor. Illustrated..... 300, 331
American and English Practice Agrees, Where. 93
American and English Telephone Practice..... 290
American Bell Telephone Company's Annual Report..... 214
American Electric Fuse Company. Portraits.. 129
American Institute of Electrical Engineers.... ..... 84, 141, 199, 267, 302, 306, 382, 383
American Thermat Company's Printing Press Controller. Illustrated..... 203
American Society of Naval Engineers..180, 181, 182
American Steel and Wire Company..... 189
American Street Railway Association..... ..... 72, 99, 140, 141
American Water Motor. Illustrated..... 384
Analysis of the Cost of the Generation and Distribution of a Unit of Electricity. By Calvin W. Rice. (Discussion, National Electric Light association)..374, 375, 376, 377, 381, 382
Anchor Electric Company's Affairs..... 335
Ancient Fittings, Modern Lights in. Illustrated 103
Anderson Galleries (Catalogues Wanted)... 141
Anti-Bell Movement in Western New York.... 111
Antiquarian City, The..... 92
Appropriation, Liberal, for Electrical Extension in Chicago..... 151
Arc Lamp, Enclosed (General Electric). Illustrated 244
Arc Lamp, Jandus Enclosed. Illustrated..... 57
Arc Lamps, Enclosed, The Trimming and Cleaning of. By Hallberg..... 294
Arc System, Enclosed, Novel High-tension Series. By J. H. Hallberg. E. E..... 175
Arcs, Enclosed, for Mill Lighting..... 250, 251
Armature Construction (General Electric). Illustrated..... 245
Armature, Magnet and, Windings. Illustrated.. 183
Armington & Sims Engine Coupled to General Electric Dynamo. Illustrated..... 259
Armstrong Valley Poles. Illustrated..... 84
Armour Institute of Technology..... 51
Armstrong (Mr.) on Electrical Journalism.... 20
Arnold, B. J. (The Electric Railway of 1807 and 1898)..... 8, 9
Art of Electric Telephonic Apparatus. By H. P. Clausen. Illustrated. (Chicago Electrical association)..... 127, 128, 129
Australian Telephone Statistics..... 285
Automatic Telephone Service. Illustrated.. 229
Automatic Telephony in England. Illustrated.. 299
Automatic (Telephone) Service for Rochester.. 333
Auxiliary Cars in Storage-battery Traction. Illustrated..... 151, 152, 153
Auxiliary Signals as Applied to the Telephone. By H. P. Clausen. Illustrated.... 256, 257, 284

Badt, F. B. (Topics of Interest to Central-station Men)..... 67
Badt Hermetic Cell. Illustrated..... 175, 176
Balloon, Observation (War News)..... 241
Bartlett, C. W. Portrait..... 173
Battery, Edison-Lalande. Illustrated..... 133
Battery, Gordon-Delamere..... 134
Battery, Leclanche. Illustrated..... 133
Battery, Partz. Illustrated..... 133
Battery, Samson..... 133, 134
Battery Telephone Generator, A (Warner). Illustrated..... 313
Bates Alternating-current Ceiling Fan. Illustrated..... 331
Battleship Detecting Approach of Torpedo Boat by Searchlight (War News). Illustrated.. 297
Bearings in Electrical Machinery. By B. F. Fells. Illustrated..... 183
Belfield, A. Miller. (The Hunter Patents of December 21, 1897. Illustrated)..... 166, 197, 168
Bellamy's Ideas in Practice. By E. C. Dickinson..... 187
Bellegarde, Electric Power Transmission at. Illustrated..... 293
Bell Company, Fighting the..... 187
Bell Company's Plans Miscarry..... 158
Bell Instruments, Output of..... 270
Bell Interests in New England..... 214
Bell Investment, A..... 200
Bell Practice Unappreciated..... 4
Bell Telephone Companies Report Good Business..... 49
Bell Telephone Company's Annual Report, American..... 214
Bells, Bridging and Series (Western Telephone Construction company). Illustrated..... 333
Bell's Romance, Prof..... 137
Belt-driven Railway Generator. (General Electric). Illustrated 13, 14
Bicycle Lamp, Dupee Acetylene. Illustrated.. 28
Bicycle Lamp, Electric. Illustrated..... 244
Biography of a Piece of Copper Wire. By Channing T. Gage. (Chicago Electrical association) 209, 210, 211
Bisland, W. A. Portrait..... 117
Bissell & Co.'s Telephone Cable Distributing Board. Illustrated..... 271
Blindness, Electric-light..... 27
Blow-torch, Combination Hot-blast (White Manufacturing company). Illustrated..... 14
Bluff City Railway..... 217
Boilers, Volatile Oils in, Physical and Chemical Properties of. By W. H. Edgar. With discussion. (Northwestern Electrical association)..... 63, 64
Book Table and Book Notes..... 155, 217, 251
Bossart, Paul W. Portrait..... 118
Boston, Large Three-phase Lighting Station in.. 112
Bowen, M. K., President Chicago City Railway Company. Portrait..... 47
Brazer, Grant (White Manufacturing company). Illustrated..... 96
Bridge Building at Niagara Falls. By Orrin E. Dunlap. Illustrated 50, 51
Bridged-circuit Telephone, How to Select a. By H. P. Clausen..... 364
Bridging and Series Bells (Western Telephone Construction company). Illustrated..... 333
Brown, Clarence E. Portrait..... 129
Brown Emergency Device. Illustrated..... 70, 71
Brush, Carbon, La Valley Vitæ. Illustrated.... 15
Buffalo, Independent Telephone Exchange Company in..... 159
Buffalo, Niagara Power in. By Horatio A. Foster 26, 27
Buffalo, Niagara Power in..... 103, 104, 238, 239
Bullock Generators and Motors. Illustrated.... 15
Bullock Generator. Illustrated..... 230
Bullock Motor-driven Planer. Illustrated..... 286
Burgess, C. F. (Electrical Equipment of Plating Plants)..... 195, 196, 197
Burns, P. C. Portrait..... 122
Business Outlook (1897-1898)..... 11, 12, 13
Butterworth, Benjamin, Death of. Portrait.... 49
Butterworth, Major, Tribute to..... 84

Cabby's Farewell..... 92
Cable Communication (War News)..... 379
Cable-cutting, Legal Aspect of (War News).. 347
Cable, Fire and Burglar, Montauk Multiphase. Illustrated..... 40, 231
Cable and Horse Cars, Electric..... 316, 317
Cable-layers for Emergency Service (War News)..... 213
Cable Laying on Long Island Shore. Illustrated..... 106, 107
Cable Project, Pacific..... 169, 213, 302, 303
Cable Routers in War Time (War News)..... 316
Cable Restrictions (War News)..... 316, 347
Cable, The Manila-Hongkong (War News)..... 286
Cables, Ocean, in War Times. By Alexander Porter Morse..... 26
Cables, Submarine, Ownership of..... 26
Cables, West Indian (War News). With map.. ..... 227, 272, 297, 316, 334, 347, 363
Caloric Motor, Diesel's. Illustrated..... 111, 112, 314
Calumet Electric Street Railway Company (annual report)..... 39
Canada, Electrical Development in..... 5
Canada, Electrical Imports in..... 104
Canada, Long-distance Telephony in..... 229
Canadian Bell Telephone Company..... 174
Canadian Electrical Association..... 231, 384, 385
Canadian Intelligence (Correspondence).. ..... 43, 44, 147, 148, 161, 176, 204, 288, 354, 355
"Cannon Electricity," Demand for..... 26
Capsule Microphone. Illustrated..... 172
Carbon Brush, Le Valley Vitæ. Illustrated.... 15
Carbonizing Peat by Electricity. Illustrated.. 238
Carbons, Arc..... 68
Card Dynamo Coupled to Weston Engine. Illustrated..... 216
Card Generator. Illustrated..... 258
Car-changing System, Consolidated. Illustrated.... 146
Carlisle & Finch's Hydro-electric Fan System. Illustrated..... 353
Carlson, A. Portrait..... 117, 118
Carriage, Columbia Electric. Illustrated..... 301
Cars, Auxiliary, in Storage-battery Traction. Illustrated..... 151, 152, 153
Cars, Trolley, Electric Elevator for Hoisting. Illustrated..... 263
Cartwright Enclosed Air-tight House. Illustrated..... 71
Catalogues, Trade, in Foreign Languages..... 217
Catalogues Wanted, Dynamo. By R. Anderson. (Communication)..... 141
Ceiling Fan, Bates Alternating-current. Illustrated..... 331
Ceiling Fan, Hunter. Illustrated..... 83
Cell, Badt Hermetic. Illustrated..... 175, 176
Central Electric Company on Fifth Avenue. Illustrated..... 344, 345
Central Energy Telephone System (Stromberg-Carlson). Illustrated..... 348
Central Power Plants on Board Ship vs. Distribution of Power. By William S. Aldrich. (American Society of Naval Engineers).... ..... 180, 181, 182
Central-station Advancement (1897-1898). By Louis A. Ferguson..... 7, 8
Central-station Companies Combine, Philadelphia..... 141
Central Station, Development of the. By Samuel Insull..... 306, 307, 308, 309, 315, 325, 326, 327
Central-station Men, Topics of Interest to. By F. B. Badt. (Northwestern Electrical association)..... 67
Central Switchboard. Illustrated 15, 16
Central Union Telephone Company (annual report) 49
Chapman Voltage Regulator. Illustrated..245, 246
Chase "Knock-out" Junction Boxes. Illustrated..... 300, 301
Cherry Measuring Instruments, Simple. Illustrated..... 72
Chicago Alley "L" Affairs..... 84
Chicago, Big Subway Project in..... 37
Chicago Edison Company, Three-phase Transmission Plant of the. Illustrated..1, 2, 3, 4
Chicago, A Department of Electricity Proposed for.. 25
Chicago City Railway Company, New Officers of the. Portraits..... 48
Chicago City Railway Company's Annual Meeting 48, 49
Chicago City Railway's "L" Project..... 103
Chicago City Railway System, Proposed Trolley Extensions on the. With map..... 138
Chicago (City of) Restrained from Building Lighting Plant..... 29
Chicago Convention Visitors, Finding List for. 330
Chicago Edison Company..... 274, 370
Chicago Edison Company Electricity Plant. Illustrated..... 324, 325, 326, 327
Chicago Edison Volunteers for Naval Service (War News). Portraits..... 311
Chicago Electric Railway Companies, Report of..... 39, 40
Chicago Electric Storage-battery Road, Englewood and, Efficiency Tests on the. Illustrated 76, 77, 78, 79, 84
Chicago Electric Traction Company..... 19, 20
Chicago Electrical Association..... ..... 36, 64, 65, 127, 128, 129, 130, 131, 166, 167, 168, 209, 210, 211, 223, 224, 225, 314, 315
Chicago, Electric Extension in, Liberal Appropriation for..... 151
Chicago Engineers' Club..... 2
Chicago Fire-alarm Service, Storage Batteries for..... 141
Chicago Fire, Electrical Men Suffer Loss in.. 179
Chicago, General Electric Warehouse and Repair Shops in. Illustrated..... 383
Chicago General Railway Company (annual report)..... 39, 40
Chicago Has a Department of Electricity..... 61
Chicago, Independent Telephone Movement in.. 123
Chicago's Business District, The Trolley in. With map..... 252
Chicago's Electrical Department..... 89
Chicago's Electrical Plants..... 244, 245
Chicago Street-lighting Plants, Contracts for... 213
Chicago Telephone Company (annual report) 49
Chicago, Telephone Extension in..... 186
Chicago, The Trolley Wins in..... 185
Chicago Volunteers for Brigade of Engineers (War News) 283
Chicago, War News in, by Telephone..... 213
Chillicothe, A Gentle Reminder in. Illustrated.. 292
China Specialties, New Peru. Illustrated..... 28
Chippewa, Wis., Telephone Fight in..... 100
Cienfuegos, Cable-cutting at (War News). Illustrated 297, 311
Cincinnati Edison Station, New..... 85
City Ownership of Street-railway Lines..... 112
City Restrained from Building Lighting Plant.. 29
City Telegraph Superintendents..... 335
Clark, Frank H. (Storage-battery Applications, 1897-1898)..... 11
Clausen, H. P. (Art of Constructing Telephone Apparatus. Illustrated)..... 127, 128, 129
Clausen, H. P. (Auxiliary Signals as Applied to the Telephone. Illustrated)..... 256, 257, 284
Clausen, H. P. (How to Select a Telephone)... 215
Clausen, H. P. (How to Select a Bridged-circuit Telephone)..... 364
Clausen, H. P. (Intermediate Switchboards for Series Toll Lines. Illustrated)..... 284, 285
Clausen, H. P. (Operating Telephone and Electric-lighting Systems in Connection. Illustrated)..... 332, 333
Clausen, H. P. (Telephone Manufacturers)..... 214
Clausen, H. P. (Telephone Systems for Large Manufacturing Plants. Illustrated)..... 312, 313
Cleaning, The Trimming and, of Enclosed Arc Lamps. By J. H. Hallberg..... 294
Coal Mine, Electrical Pumping and Hoisting in. Illustrated..... 168, 169
Coast Defenses, Electrical Communication with 165, 200
Coast, Electrical Work Along the (War News) 235, 272
Columbia Construction Company (annual report)..... 49

28606

Columbia Electric Carriage. Illustrated....... 301
Columbia University, Electrical Engineering at. Illustrated.......154, 155
Combination Hot-blast Blow-torch (White Manufacturing company). Illustrated....... 14
Commercial Cable Company........ 171
Commercial Ironclad Motor. Illustrated...... 353
Commercial Limits of High-tension Transmission. Illustrated...... 253
Commonwealth Electric Company...... 315
Commutation, Experiments on, in Dynamos and Motors. By W. H. Everett, B. A., B. E., and A. H. Peake. Illustrated.........280, 281
Compound-wound Dynamos, Regulation of. Illustrated........281, 287, 288
Conduits, Loricated Electric. Illustrated...... 230
Congress, Technical Projects Before.......... 41
Conkey Printing Establishment, Electrical Equipment for the........ 295
Connecticut, No More Steam Roads for...... 71
Constructing Telephone Apparatus, Art of. By H. P. Clausen. Illustrated. (Chicago Electrical association)........127, 128, 129
Construction and Inspection, Electrical (1897-1898). By W. H. Merrill, Jr..........10, 11
Convention (Milwaukee) Echoes...........69, 70
Convention Visitors, Finding List for......... 330
Cook, F. B. Portrait........ 118
Cooking and Heating, Electric, A Survey of the Possibilities of. By W. P. Adams. (Northern Society of Electrical Engineers, England)........152, 153
Copeland, F. A. (The New President)......54, 55
Copper Market, Activity in the........ 190
Copper Market, Effect on the (War News)..... 347
Copper Production, Present, Economic Effects of. By Franklin H. Wentworth......... 143
Copper Wire, A Piece of, Biography of. By Channing T. Gage. (Chicago Electrical association)........209, 210, 211
Correspondence School, Electrical Engineer's.. 216
Corrigan, C. E. (Condition of the Horseless Carriage Industry, 1897-1898)........ 9
Cosmopolitan Electric Company's Plans...... 203
Coster, Maurice. Portrait........322, 323
Cost of the Generation and Distribution of a Unit of Electricity, Analysis of the. By Calvin W. Rice. With discussion. (National Electric Light association) 374, 375, 376, 377, 381, 382
Couch, S. H. Portrait........ 119
Council Grove, Kan., Telephone Extension at.. 270
Coupling Switches for Accumulators. Illustrated........ 237
Creosoted Wood, Electrical Uses of 134
Crider Telephone Specialties. Illustrated...... 271
Crossing of Telephone and Trolley Wires.... 298
Cuba, Telegraphic Communication with....... 203
Cuming, James S. Portrait..............118, 119
"Curious Things Electrical"........ 237
Cushing, L. K. Portrait........ 231
Cutler, Harry H. (Regulation and Protection of the Electric Motor)............223, 224, 225

Dancing, Fancy, Electric Lighting and. Illustrated........ 141
Dawson City, The Telephone in........ 201
Deaf Mutes, Microphonograph to Aid in Educating. Illustrated........ 139
Dearborn Analytical Laboratories. Illustrated. 301
Death from Electrical Shock at Low Potentials. 199
Deering Works, Induction Motors in the. Illustrated........249, 250, 251
Definition of "Plant," Very Limited, Upheld... 253
De Land, Fred. (Municipal Socialism)........85, 86
Denver Exchange, New........ 365
Department, Chicago's Electrical........ 89
Department Notes........ 16, 17, 29, 30, 31, 44, 45, 58, 59, 60, 73, 74, 86, 87, 88, 100, 101, 114, 115, 116, 148, 149, 150, 161, 162, 163, 177, 178, 190, 191, 192, 204, 205, 206, 219, 220, 233, 234, 247, 248, 260, 261, 262, 274, 275, 276, 289, 29?, 303, 304, 317, 318, 336, 337, 355, 356, 371, 372, 385
Department of Electricity, A, Proposed for Chicago........ 25
Department of Electricity, Chicago Has a...... 61
Des Moines, Iowa, Mutual Telephone Company. Illustrated........ 173
Developing Power of Lower Niagara. By Orrin E. Dunlap. With map..............360, 361
Development of a School of Electrical Engineering. By Harold B. Smith, M. E............. 317
Development of the Central Station. By Samuel Insull........306, 307, 308, 309, 315, 325, 326, 327
Dewey, Commodore, Interested in Electric-light Signaling (War News)........ 272
Diagrams, Proposed Standard, of Electrical Apparatus. Illustrated. (Chicago Electrical association)........130, 131
Dickinson, E. C. (Bellamy's Ideas in Practice). 187
Diesel's Caloric Motor. Illustrated....111, 112, 314
Diffusion of Light, The........ 323
Dillman, M. J. (The Firman Patent).......... 230
Dimick, H. G. (Electrical Shop Transmission. Illustrated)........64, 65
Direct-coupled Set (Mertz-Alioth). Illustrated. 180, 181
Discouragement to Business, A........ 92
Dispatch, Diplomatic, Tampered with (War News)........ 255
Distortion Measurements in Sciagraphy. By O. L. Schmidt, M. D., and W. C. Fuchs, E. E. Illustrated........ 180
Distributing Board, Telephone Cable (Bissell & Co.) Illustrated........ 271
Distribution of Alternating Currents by Transformers, Schlatter's Method of. Illustrated.294, 295
Dodge, H. C. Portrait........ 117
Dodge, H. C. (Expansion of Independent Systems. Illustrated)........122, 123
Doolittle, W. E. Portrait........ 118
Dow, Alex. (Electric Lighting for Profit.).97, 98, 99
Dow, Alex. Portrait........320, 321
Dow, Alex. (Public Lighting in Relation to Public Ownership and Operation)....366, 367, 368
Drilling Machine (Pratt & Whitney), Rapid for Manufacturers. Illustrated 83, 84
Duluth Trip, Mr. Edison and the........ 273
Dunlap, Orrin E. (Power Development at Massena. Illustrated)........22, 23
Dunlap, Orrin E. (Electrical Operation of a Great Grain Elevator. Illustrated)....62, 63, 64
Dunlap, Orrin E. (Electrolytic Work at Niagara Falls. Illustrated)........193, 194
Dunlap, Orrin E. (Ice-bridge Formation at Niagara. Illustrated)........ 179
Dunlap, Orrin E. (Protecting Inlet Canals at Niagara Falls. Illustrated)........166, 167
Dunlap, Orrin E. (Developing Power of Lower Niagara. Map)........360, 361
Dunlap, Orrin E. (Enlarging the Power Plants of Niagara. Illustrated) 373, 374, 375
Dupee Acetylene Bicycle Lamp. Illustrated.... 28
Dynamo Catalogues Wanted. By R. Anderson. (Communication)........ 141
Dynamos, Compound-wound, Regulation of. Illustrated........281, 287, 288
Dynamos (General Electric) for Moderate Speed, New. Illustrated 71, 72
Dynamos and Motors, Commutation in, Experiments on. By W. H. Everett, B. A., B. E., and A. H. Peake. Illustrated...........280, 281

Economic Effects of Present Copper Production. By Franklin H. Wentworth........ 143
Edgar, W. H. (Physical and Chemical Properties of Volatile Oils in Boilers)........63, 64
Edison Fan Motor, New. Illustrated......258, 259
Edison-Lalande Battery. Illustrated.......... 133
Edison (Mr.) and the Duluth Trip........... 273
Edison Patent for Regulation of Compound-wound Dynamos. Illustrated........281, 287, 288
Editorial........6, 24, 38, 52, 66, 80, 94, 108, 126, 142, 156, 170, 184, 198, 212, 226, 240, 254, 268, 282, 296, 310, 328, 346, 362, 378
Effect of Long-distance Telephony, One...... 16
Effect of Long-distance Telephony on Railroad Travel........81, 82, 187
Effects of the Storm on Overhead Circuits. Illustrated........ 61
Efficiency, Present, of Incandescent Lamps. By John E. Randall. (Northwestern Electrical association)........105, 106
Efficiency Tests on the Englewood and Chicago Electric Storage-battery Road. Illustrated.. ....76, 77, 78, 79, 84
Eiffel Tower Struck by Lightning. Illustrated. 20
Eiffel Tower, Warping of the........ 35
Electric, Cable and Horse Cars........316, 317
Electric Carriage, Columbia. Illustrated........ 301
Electric Floor-scrubbing Machine, Ackerman's. Illustrated........ 90
Electric Headlights (Pyle) on Western Railroads. Illustrated........92, 93
Electric Heating and Cooking, A Survey of the Possibilities of. By W. P. Adams. (Northern Society of Electrical Engineers, England). 152, 153
Electric-light Blindness........ 27
Electric Light, The, in Port Arthur........ 37
Electric-light Trimmers Not Public Officers... 185
Electric-light Wires as Telephone Circuits...... 383
Electric Lighting and Fancy Dancing. Illustrated........ 141
Electric Lighting for Profit. By Alex Dow. (Northwestern Electrical association)..97, 98, 99
Electric-lighting Systems, Telephone and, Operating in Conjunction. By H. P. Clausen. Illustrated........332, 333
Electric Locomotive, New Heilmann. Illustrated........ 5
Electric Mail Van. Illustrated...........104, 105
Electric Motor, Regulation and Protection of the. By Harry H. Cutler. (Chicago Electrical association)........223, 224, 225
Electric Power Companies and Their Relation to Municipalities. By A. E. Lang........ 273
Electric Railroading, Heavy, Proposed in France. Illustrated........331, 334, 335
Electric Railway, The, of 1897 and 1898. By B. J. Arnold........8, 9
Electric Railways in Germany........ 168
Electric Railways in Massachusetts.........95, 96
Electric Switching Locomotive in Hoboken. Illustrated........36, 37
Electrical Apparatus, Proposed Standard Diagrams of. Illustrated (Chicago Electrical association) 130, 131
Electrical Communication with Coast Defenses. 165, 200
Electrical Construction and Inspection (1897-1898). By W. H. Merrill, Jr...........10, 11
Electrical Department, Chicago's........ 89
Electrical Development in Canada........ 5
Electrical Development in South Africa...... 25
Electrical Energy in Paris. Illustrated....376, 377
Electrical Engineering at Columbia University. Illustrated........154, 155
Electrical Engineering, Development of a School of. By Harold B. Smith, M. E....... 317
Electrical Engineer's Correspondence School.. 216
Electrical Equipment of Plating Plants. By C. F. Burgess........195, 196, 197
Electrical Equipment (Woods) for Vehicles, New. Illustrated........82, 83
Electrical Exports, A Year's........34, 35
Electrical Extension in Chicago, Liberal Appropriation for........ 151
Electrical Features of the Greater New York Celebration. Illustrated........19, 20
Electrical Industry, The Record and Promise of the, for the years 1897-1898........7, 8, 9, 10, 11, 12, 13
Central Station Advancement. By Louis A. Ferguson 7, 8
Isolated Plants. By R. H. Pierce........ 8
The Electric Railway of 1897 and 1898. By B. J. Arnold........8, 9
Condition of the Horseless Carriage Industry. By C. E. Corrigan........ 9
The Telephone in 1897. By A. S. Hibbard. 9
The Independent Telephone Movement in 1897, Its Development and Organization, and its Prospects for 1898. By James M. Thomas........9, 10
Long-distance Power Transmission. By J. B. Wallace........ 10
Electrical Construction and Inspection. By W. H. Merrill, Jr........10, 11
Storage Battery Applications. By Frank H. Clark........ 11
The Telegraph in 1897........ 11
Business Outlook........11, 12, 13
Electrical Installation Under Difficulties........146
Electrical and Insurance Interests (Portrait of William H. Merrill, Jr.)........ 323
Electrical Journalism, Mr. Armstrong on...... 20
Electrical Legislation in Virginia........ 25
Electrical Machinery, Bearings in. By B. F. Fells. Illustrated........ 183
Electrical Men Offer Their Services (War News) 231, 232
Electrical Men Suffer Loss in a Chicago Fire.. 179
Electrical Operation of a Great Grain Elevator. By Orrin E. Dunlap. Illustrated......62, 63, 64
Electrical Plant in the Alexian Brothers' Hospital. Illustrated........33, 34, 35
Electrical Plant at the Paris Exposition........ 278
Electrical Production of Ozone. Illustrated.. ....305, 306, 307, 308, 309
Electrical Pumping and Hoisting in a Coal Mine. Illustrated........168, 169
Electrical Reduction of Ores. By Robert A. Moore (Communication)........ 141
Electrical Shock, Death from, at Low Potentials........ 199
Electrical Shop, The. Illustrated........ 140
Electrical Shop Transmission. By H. D. Dimick. Illustrated. (Chicago Electrical association)........64, 65
Electrical Undertaking in New York, A Great.. 112

Niagara Power in Buffalo 103, 104, 238, 239
Niagara Power Development 23
Niagara, Power Plants of, Enlarging the. By Orrin E. Dunlap. Illustrated 274, 275
Nonpareil Cork Pipe Covering. Illustrated 28
North Carolina, Independent (Telephone) Movement in 201
North Chicago Street Railroad company (annual report) 39
Northern Society of Electrical Engineers, England 152, 153
Northwestern Electrical Association. Illustrated 5, 20, 35, 53, 54, 55, 56, 57, 63, 64, 67, 69, 70, 85, 86, 97, 98, 99, 103, 105, 106, 138, 152, 185, 193, 315, 329, 330, 339, 357, 358, 359, 369, 370
Northwestern Electrical Association (Convention at Milwaukee) 53, 54, 55, 56, 57, 69, 70
Northwestern Electrical Association (Convention on Steamer Northwest). Illustrated 357, 358, 359, 369, 370
Northwestern Notations (Correspondence) 43, 100, 113, 114, 147, 161, 176, 177, 218, 219, 232, 233, 288, 289, 303, 371
Ocean Cables in War Times. By Alexander Porter Morse 26
Ohio, Electrocution in 295
Oils, Vegetable, in Boilers. Physical and Chemical Properties of. By W. H. Edgar. With discussion. (Northwestern Electrical association) 63, 64
Omaha Exposition. Illustrated 140, 235, 236, 237, 335
Operating Telephone and Electric-lighting Systems in Conjunction. By H. P. Clausen. Illustrated 332, 333
Orchestra Lamp, Ward. Illustrated 28
Ore Separators, Magnetic 239
Ores, Electrical Reduction of. By Robert A. Moore (Communication) 141
Organization, Influence of, in the Independent Telephone Movement. By James M. Thomas 125
Orient, The Telephone in the 271
Overhead Circuits, Effects of the Storm on. Illustrated 61
Overshiner, E. B. Portrait 125
Owens, Prof. R. B. (Electricity in Municipal Engineering) 138, 139
Ownership and Operation, Public, Public Lighting in Relation to. By Alex Dow. With discussion. (National Electric Light association) 366, 367, 368, 369
Ownership of Submarine Cables 26
Oxley, Eustace. (Multiple-rate Metering. Illustrated) 20, 21, 22, 36
Ozone, Electrical Production of. Illustrated 305, 306, 307, 308, 309
Ozone, Purification and Sterilization of Water by. Illustrated 309

Pacific Cable Project 169, 213, 302, 303
Pacific Coast, Independent Telephone Movement on the 187
Pan-American Exposition, Electrical Feature of the. Illustrated 90, 91
Pan-American Exposition Deferred 151
Pan-American Notes 141
Paragon Speed Indicator. Illustrated 189
Paris Exposition, Electrical Plant at the 278
Parsons, Arthur C., Appointed Lieutenant in Navy. Portrait 379
Partz Battery. Illustrated 133
Paris, Electrical Energy in. Illustrated 376, 377
Patent Attorney, Regulation of 232
Patent, Consolidated Car-heating. Sustained 140
Patent, Edison, for Regulation of Compound-wound Dynamos. Illustrated 281, 287, 288
Patent, The Firman, Communication from the Western Telephone Construction company 214
Patent, Firman, Disclaimer in 244
Patent, Firman Switchboard, Sustained. (Communication from Barton & Brown) 201
Patent, Lamp Holder, Alleged Infringement of. By F. R. Whittlesey. (Communication) 113
Patent Law, Changes in the 22
Patent Legislation, Important 363
Patent Legislation, Remedial 106, 107
Patent Office Improvements 225
Patent Office Rules Amended 288
Patent Record, Illustrated Electrical 18, 31, 32, 45, 46, 60, 74, 88, 102, 116, 136, 150, 163, 164, 178, 192, 206, 220, 234, 248, 262, 276, 290, 304, 318, 337, 338, 356, 372, 385, 386
Patent, Scribner Multiple Telephone Switchboard, Sustained. Illustrated 110, 111

Patent, The Firman. By M. J. Dillman. (Communication).......... 230
Patents and Inventions..........301, 302
Patents and Trademarks.......... 211
Patents, New Commissioner of..........61, 75
Patents, The Hunter, of December 21, 1897. By A. Miller Belfield. Illustrated. (Chicago Electrical association)..........166, 167, 168

Perry, Nelson W., Death of. Portrait........ 199
Peru China Specialties, New. Illustrated.... 28
Peru Porcelain Specialties, New. Illustrated.. 354
Philadelphia Central-station Companies Combine.......... 141
Philadelphia Electrical Exhibition.........182, 274
Philadelphia, Telephone Competition for...... 230
Philadelphia Trolley Accident.......... 16
Philippine Islands, Telegraphic Communication with the (War News)..........272, 286
Phœnix Telephone Apparatus. Illustrated.... 131
Photometer, New Electric-light. Illustrated....384
Physical and Chemical Properties of Volatile Oils in Boilers. By W. H. Edgar. With discussion. (Northwestern Electrical association)..........63, 64
Pierce, R. H. (Isolated Plants in 1897-1898).. 8
Pipe Covering, Nonpareil Cork. Illustrated... 28
Planer, Motor-driven (Bullock). Illustrated.. 286
"Plant," Very Limited Definition of, Upheld.. 253
Plating Plants, Electrical Equipment of. By C. F. Burgess..........195, 196, 197
Poles, Armorite Trolley. Illustrated.......... 83
Pontiac-Flint Electric Railway.......... 185
Porcelain Specialties, New Peru. Illustrated.. 354
Porous Cup, Western Electric. Illustrated... 274
Port Arthur, The Electric Light in.......... 37
Portable Electric Motors for Shops. Illustrated 238
Portland, Ore., Exchange. Illustrated.....121, 122
Postal Company's Marine Cable System, Completing the 97
Power Conversion, Morrison's Apparatus for. Illustrated 277, 278
Power Development at Massena. By Orrin E. Dunlap. Illustrated 22, 23
Power Development, Niagara.......... 23
Power, Distribution of, Central Power Plants on Board Ship vs. By William S. Aldrich (American Society of Naval Engineers)..........180, 181, 182
Power House at Niagara Falls, Enlarged. Illustrated 137
Power of Lower Niagara, Developing. By Orrin E. Dunlap. With map..........360, 361
Power, Niagara, in Buffalo. By Horatio A. Foster 26, 27
Power Plant, Interesting French. Illustrated.. 188
Power Plants of Niagara, Enlarging the. By Orrin E. Dunlap. Illustrated..........373, 374, 375
Power Transmission, Electric, at Bellegarde. Illustrated 293
Power Transmission, Long-distance (1897-1898). By J. B. Wallace.......... 10
Power Transmission Plant for Mexico, Large.. 274
Practical Repair Hints. By B. F. Fells. Illustrated.......... 90
Practice, Machine. Illustrated 239
Practice of Theory. By J. C. McMynn (Northwestern Electrical association).......... 152
Pratt & Whitney's Rapid Drilling Machine for Manufacturers. Illustrated..........83, 84
Present Efficiency of Incandescent Lamps. By John E. Randall. (Northwestern Electrical association)..........105, 106
Pressroom, A Modern. Illustrated..........221, 222, 223, 224, 225
Printing Establishment, Electrically Driven. Illustrated 68, 69
Printing-press Controller (American Rheostat company). Illustrated 203
Printing Plant (Conkey), A Great, Electrically Operated 138, 205
Profit, Electric Lighting for. By Alex Dow. (Northwestern Electrical association) 97, 98, 99
Protecting Inlet Canals at Niagara Falls. By Orrin E. Dunlap. Illustrated..........166, 167
Protecting Telephone Circuits from Heavy Currents. Illustrated 298
Protection of the Electric Motor, Regulation and. By Harry H. Cutler. (Chicago Electrical association)..........223, 224, 225
Public Lighting in Relation to Public Ownership and Operation. By Alex Dow. With discussion. (National Electric Light association)..........366, 367, 368, 369
Public Telephones in Greater New York...... 298
Pumping and Hoisting in a Coal Mine, Electrical. Illustrated..........168, 169
Purification and Sterilization of Water by Ozone. Illustrated 309
Pyle Electric Headlights on Western Railroads. Illustrated..........92, 93

Queen & Co.'s New Electric-light Photometer. Illustrated 384
Queen & Co.'s Portable Testing Set. Illustrated 149

R. & H. Motor Starter. Illustrated.......... 161
Railroad Operation, The Telephone in.......... 145
Railroad Travel, Effect of Long-distance Telephony on 81, 82, 187
Railway Companies, Chicago, Electric, Reports of..........39, 40
Railway Generator, Belt-driven (General Electric). Illustrated..........13, 14
Railway Generators, Large.......... 95
Railway Project, Extensive.......... 176
Railway Shop, Lighting Plant in. Illustrated. 291
Railway, The Electric, of 1897 and 1898. By B. J. Arnold..........8, 9
Railway Motors, Suspension of.......... 84
Randall, John E. (Present Efficiency of Incandescent Lamps)..........105, 106
Randall, James D. Portrait.......... 119
Rapid Transit in New York. By Matthew Marshall 3, 4
Raster Rheostat. Illustrated.......... 146
"Reasonable Compensation" 26
Receiver, Solid Metal (Ericsson). Illustrated.. 333
Reduction of Ores, Electrical. By Robert A. Moore. (Communication) 141
Regulation of Compound-wound Dynamos. Illustrated..........281, 287, 288
Regulation and Protection of the Electric Motor. By Harry H. Cutler. (Chicago Electrical association)..........223, 224, 225
Relations, The, between the Customer, Consulting Engineer and the Electrical Manufacturer. By S. Dana Greene. With discussion. (New York Electrical society)....50, 51, 68, 69
Reminder, A Gentle. Illustrated.......... 292
Repair Hints, Practical. By B. F. Fells. Illustrated 90
Reports of Chicago Electric Railway Companies..........39, 40
Restriction upon Right to Put Wires Underground 317
Rheostat, Raster. Illustrated.......... 146
Rhotehamel, J. H., Death of.......... 113
Rice, Calvin W. Portrait..........320, 341

EVERY SATURDAY.

Vol. XXII. CHICAGO, JANUARY 1, 1898. No. 1

Three-phase Transmission Plant of the Chicago Edison Company.

In the year just closed one of the most significant and important developments in electrical engineering has been the increase in the use of multiphase alternating-current transmission in combination with direct-current distribution in central-station systems and the consequent employment of rotary transformers. An instructive example of this is furnished by the recent installation of a three-phase transmission plant in and connecting the Harrison street and Twenty-seventh street stations of the Chicago Edison company.

The idea of the scheme of transmission of electrical energy adopted by the Chicago Edison company is to concentrate the steam generating plant for the entire city of Chicago and its suburbs in its two downtown stations, which are located on the river front at Harrison street and Washington street, abandoning the generation of steam in its other central stations, which are placed at Twenty-seventh street and Wabash avenue for the southern residence district, and at Oak and Clark streets for the northern residence portion of the city. The same method would naturally be employed in connection with other outlying territory which may hereafter be supplied by the company.

The method which is now in use for transmitting energy from the Harrison street station to the Twenty-seventh street station is not the permanent method which the company hopes to carry out, but is one which is used temporarily for shutting down the Twenty-seventh street station as a steam plant for a period of 18 hours each day. Ultimately, it is the intention to install at Harrison street either three-phase generators of the revolving-field type which will generate alternating current at 4,000 volts, or to use special generators which will be able to give out three-phase alternating current and direct current at the same time in any proportions desired up to the stated capacity of the machines. In case the latter machines are used their direct-current sides will feed into the main bus-bars of the station, their alternating-current sides being connected to step-up transformers feeding the various transmission lines, the transformers being wound for the desired voltage on the lines. It is probable that the company will use the straight three-phase generators for the greater portion of this work, and will use the combination machines for the day load of the various sub-stations, the object of the combination idea being to keep the generators full loaded at all times during which they operate. The combination generators will furnish whatever alternating current is necessary for the transmission lines, and the balance of their capacity will be utilized by feeding direct current into the main direct-current bus-bars of the station, thus keeping the generators full loaded at all times during which they operate.

A fair idea of the transmission plant now in operation may be obtained from the pictures on this and the following pages. Fig. 1 is a view in the Harrison street station, with the rotary transformer in the foreground. Back of it is the big general gallery switchboard, while the special stationary transformer board is shown below. Fig 2. gives an enlarged view of the rotary transformer at Harrison street, showing both direct and alternating-current sides. The stationary transformers and the special switchboard at Harrison street are shown in Fig 3, while the panel of the general board at this station

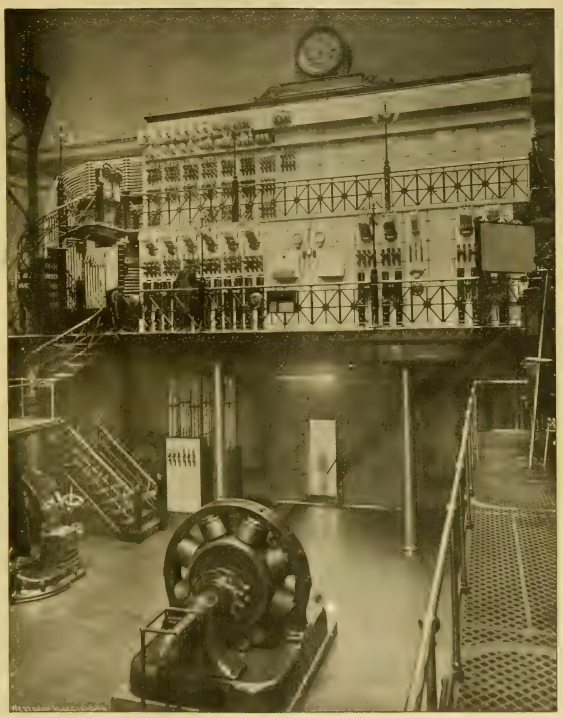

FIG. 1. THREE-PHASE TRANSMISSION PLANT OF THE CHICAGO EDISON COMPANY.—VIEW IN HARRISON STREET STATION, SHOWING ROTARY TRANSFORMER.

devoted to the alternating work is shown in Fig. 4. The remaining pictures represent the plant at the other end of the line. Fig. 5 shows the stationary transformers and special switchboard at Twenty-seventh street, while Fig. 6 shows the two rotaries that are here in use, and Fig. 7 is a diagram of a characteristic load curve at this station.

In the Harrison street station is now installed the 250 kilowatt rotary transformer shown in Figs. 1 and 2. This machine is called a converse rotary, since it converts direct current to alternating current instead of alternating to direct, as is the usual custom. The direct-current side is connected to the positive and negative bus-bars of the three-wire system feeding the downtown district of the city. The direct current is taken through the rotary at from 230 to 290 volts, according to the pressure on the bus-bars in the station. The current is changed while passing through the machine to three-phase alternating current at from 138 to 174 volts, according to the pressure on the direct-current bus-bars. The machine has eight poles and operates at 375 revolutions per minute, giving three-phase current at 25 cycles. The machine is very generous in its proportions and is designed on the same general lines as the direct-current generators of the General Electric company, which manufactured it. A tachometer is belted from the shaft of the rotary and is shown on the base of the machine in Fig. 2. The speed is controlled by means of a resistance box in the field magnet circuit. No device is used for controlling the voltage, the regulating being done at the receiving station.

The indicating and regulating apparatus for the rotary transformer at Harrison street is located on the main regulating switchboard of the station. A Weston illuminated dial, vertical-reading ammeter is installed for the direct-current side of the rotary. Below it are two knife switches, one for the positive and one for the negative side, used to connect the rotary to the direct-current bus-bars. A small switch which is shown between the larger knife switches (on the panel to the right in Fig. 4) is used for shunting the starting box, the multiple contact switch for which is located directly below the knife switches. The circular multiple contact switch at the bottom of the panel controls the resistance box for the fields of the rotary. The starting up of the rotary is effected by means of a starting box in the direct current side, in the same manner as a direct current motor.

From the alternating side of this large rotary transformer the current is taken to the low-pressure side of six step-up transformers, which raise the pressure to about 2,300 volts. These transformers and the switchboard for them are shown in Fig. 3. The energy is then transmitted to the Twenty-seventh street station, a distance of 3¼ miles, by means of a No. 00 B. & S. three-conductor twisted paper-insulated, lead-encased and jute-wound cable, which is drawn into the duct system between the two stations at Twenty-seventh street the transmission line connects with a set of step-down transformers (Fig. 5), which reduces the pressure from the line voltage to about 75 volts. The current then passes through two induction regulators, which have a range of 15 per cent. The induction regulators are connected to the alternating side of the rotary transformers of this station (Fig. 6), one regulator being used for each rotary transformer. The current, after passing though the rotary, is changed from three-phase alternating current to direct current of from 115 to 125 volts potential, according to the pressure required on each side of the direct-current three-wire bus-bar in the station.

Each rotary is provided with a starting box so that it may be started from the direct-current bus-bars of the station in a manner similar to that of a

direct-current motor. When the rotaries are running at their proper speed and are in phase with the transmission line, as shown by the incandescent-lamp phase indicator, the switches on the alternating-current side of the rotaries are closed and they then begin to take current from the transmission line to deliver to the direct-current bus-bars feeding the four o'clock and operates until 12 o'clock, when it is again shut down. During the period of this operation the load is so divided that the engines operating the station run as nearly as possible at full load, the balance of the load being taken by the rotaries in much the same way as a storage battery would act if installed in the station itself. The work

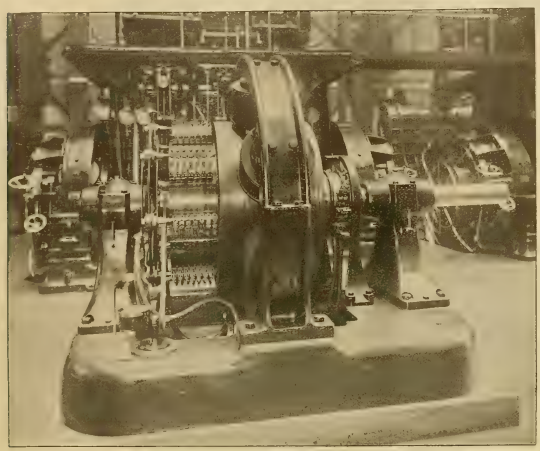

FIG. 2. THREE-PHASE TRANSMISSION PLANT OF THE CHICAGO EDISON COMPANY.—ROTARY TRANSFORMER AT THE HARRISON STREET STATION.

underground network. Each rotary transformer is provided with an ammeter for its alternating-current side and also for its direct-current side, also a resistance box in the shunt magnet circuit.

The load taken by each rotary is regulated by means of the induction regulator, which controls the voltage impressed upon each rotary. By increasing the voltage impressed the rotary is made to take a greater load, and by diminishing the voltage the load is reduced. Each stationary transformer is provided with a high-pressure three-break switch, which is operated by means of a rack and pinion, as shown in Fig. 5.

The stationary transformers and induction regulators are mounted on a marble floor, which is raised above the main floor of the dynamo room, as shown in Fig. 5, the space between the two floors forming an air chamber into which air is blown by means of an electrically driven blower, thus affording an air blast for keeping the transformers and induction regulators cool.

The indicating, regulating and switching apparatus for the rotary transformers is shown on the switchboard shown in Fig 6. The direct-current ammeters are mounted on the upper portion of the right-hand panel with the phase lamps between them. The knife switches for the direct-current side of the rotaries are directly beneath the direct-current ammeters, and the field regulating switches, each of the vertical multiple contact pattern, are seen immediately below. The switches for the alternating-current side of each rotary are at the bottom of the board. The rotaries may be started also from the alternating-current side if desired, but [illegible] started from the direct-current side. [illegible] put on the system before the direct-current dynamos are taken off. The direct-current side of the pair of rotaries are connected [illegible] exactly similar to direct-current dynamos [illegible] three-wire system, the connection [illegible] to the switchboard, and by means of the [illegible] each rotary may be connected to either the positive or negative side of the system at will.

The [illegible] are provided with [illegible]. The machines have [illegible] speed of 750 revolutions [illegible]

The load [illegible] indicate the operation of the [illegible] and how the power [illegible] It will be [illegible] switchgear must be [illegible] the rotary load between [illegible] cent. [illegible] from the [illegible] up to [illegible] the direct [illegible] are out of the [illegible] per cent. [illegible] to Harrison [illegible] end of the [illegible] Twenty-seventh street [illegible]

done by the engines is shown by the dotted curve. The work done by the rotary transformers is shown by the lower full line, the upper full line representing the sum of the engine load and the rotary load and being the total current supplied to the underground system.

It will be seen from the curve that the steam plant of the Twenty-seventh street station is operated under the best possible economy, since it is operated at full load, and as it is operated only from dusk until midnight, only one shift of

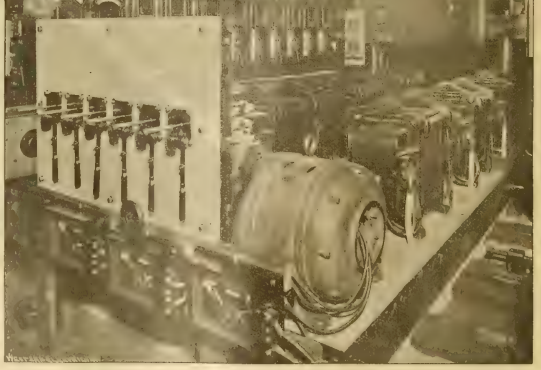

FIG. 5. THREE-PHASE TRANSMISSION PLANT OF THE CHICAGO EDISON COMPANY.—STATIONARY TRANSFORMERS, INDUCTION REGULATORS AND TRANSFORMER SWITCHBOARD AT THE TWENTY-SEVENTH STREET STATION.

[illegible] required, and during the balance of the [illegible] of the day all the energy comes from Harrison street station, and but one man is required in the Twenty-seventh street station, whose duties are to look after the operation of the rotaries. With the present method of operation a large saving is effected in coal and other operating material, since the energy is generated by the Harrison street station, where the greatest economy is found. The saving in labor is also very great, as only one shift of firemen, engineers and oilers is required.

The success of this original installation has been so marked, both from its satisfactory operation and from the great economies which have been effected, that the company intends to increase the capacity in rotary transformers to take care of the entire load of the Twenty-seventh street station, doing away entirely with the generation of steam at that point. The plans for this accomplishment have been completed for some time. It is possible that the company may install a small storage battery in the Twenty-seventh street station to operate in connection with the rotary transformers, but this question has not been definitely decided.

This transmission system has been in operation since October 13th, and up to date no difficulty of any kind has been experienced, all the apparatus fulfilling the expectations of everyone interested. From the reading of the large direct-current wattmeters, which are installed both at Harrison street and Twenty-seventh street, the input and output of the transmission system is determined daily and records are carefully kept. By the use of these wattmeters all of the losses, of whatever nature, are accounted for, and from the records of the month of December the total loss of energy in the entire transmission system was 26.4 per cent., including all the loss in the converse rotary at Harrison street, step-up transformers, line transmission, step-down transformers, induction regulators and the rotary transformers at the receiving station. The ratio between the average load and the maximum load of the transmission system for the entire month was 42.8 per cent., which shows a remarkable economy under such conditions.

Before closing the account of this interesting installation the fact should be mentioned that the orders for the apparatus embraced in it were placed with the General Electric company as early as May, 1896, the erection of the plant being deferred owing to the uncertain financial conditions of last year which are so well known to all. There seems to be no question that Mr. L. A. Ferguson, general superintendent of the Chicago Edison company, was the first to suggest the use of multiphase-current transmission and rotary transformers in connection with the direct-current distribution systems of Edison three-wire central stations. Indeed it is true that the subject was seriously considered in Chicago in the spring of 1895, at a time when the use of the alternating-current transmission in connection with Edison stations was considered a startling innovation very unlikely of accomplishment. Mr. Ferguson has given deep thought to the problem, with results which are certainly most gratifying.

Chicago Engineers' Club.

There will be a meeting of the Engineers' Club of Chicago, at 1800 Fisher building, on the evening of January 7, 1898, at 8 p. m. sharp, to listen to Edward B. Ellicott, the city electrician, on fire alarm systems. Members of the club and their friends will visit the Chicago City Railway company's power plant at Forty-ninth street and Oakley avenue, leaving clubrooms at 1:30 p. m.

Rapid Transit in New York.[1]

By Matthew Marshall.

The distinguishing feature of last week's stock market was the sustained rise in Manhattan Elevated, Third Avenue and Metropolitan Street Railway, resulting from the decision of the Supreme Court not to approve the scheme submitted to it for an underground rapid transit railroad, except upon conditions practically impossible of fulfillment. The court requires a stipulation from the Rapid Transit Commission that the bond to be given by the contractors for the building and operation of the pro-

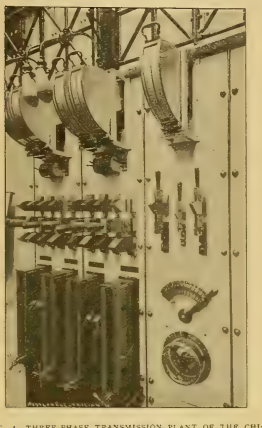

FIG. 4. THREE-PHASE TRANSMISSION PLANT OF THE CHICAGO EDISON COMPANY.—PANEL OF GENERAL SWITCHBOARD AT THE HARRISON STREET STATION FOR ROTARY TRANSFORMER.

posed road shall be in the penalty of not less than $15,000,000. Such a bond, the commissioners say, and it is generally conceded, cannot be obtained. Moreover, the court intimated that the building of the road would cause an increase of the city's debt beyond the constitutional limit of 10 per cent. of the assessed value of its taxable real estate, although it left that point to be determined by the Court of Appeals in another suit or suits, there being no right of appeal to that court in the pending proceedings. An effort will be made to persuade the Supreme Court to recede from its requirement of a $15,000,000 bond, but its success is doubtful, and, in any event, the question of the debt limit is likely to prove an insuperable bar to the execution of the scheme. Then, too, the incoming mayor and comptroller are unfriendly to it, and as they will become on January 1st, official members of the Board of Rapid Transit Commissioners, they may be expected to delay its progress, even if all other obstacles to it shall be removed. Hence, the prospect is, that the existing elevated and street surface railroads will have no competition to contend with for many years.

The history of rapid transit in this city is one of successive efforts and defeats. The project had its inception in the fertile brain of the Hon. Abram S. Hewitt, who, in January, 1688, when he was mayor of the city, sent a message to the Board of Aldermen outlining a plan for a railroad from the city hall northward, partly underground, partly in an open cutting and partly on the surface of the street or above it, to be built by the city and leased by it for a term of years at a rental which would eventually reimburse its cost and leave it the property of the city, very much in the same way as is now proposed. Mr Hewitt's road was to begin under the Harlem railroad at Fifty-fourth street, and run thence under the Harlem railroad, the New York Central railroad station, the present Murray Hill tunnel and Fourth avenue to the head of Lafayette place. There it was to pass in an open cutting, through Lafayette place and Elm street, as widened, to the city hall. His plan also contemplated several branch and extension tunnels and surface or elevated roads, to accommodate the portions of the city off the main line. The cost of constructing the line from Forty-second street to the city hall Mr. Hewitt estimated at $10,000,000, which, he proposed, should be raised by the city by selling three per cent. bonds, and his idea was that the New York Central Railroad company should take a 99 years' lease of that line at an annual rental of five per cent. on the bonds issued to pay for it. This would meet the three per cent. interest on the bonds and leave two per cent. for a sinking fund to extinguish the principal, the city thus owning the road at the end of the lease free of debt.

Mayor Hewitt's plan was not favorably received, principally, it would seem, because it was thought to be intended to benefit the Vanderbilt family, who then owned largely of the stock of the New York Central Railroad company. Still, his suggestion was so valuable, and the clamor for improvement in the means of transportation between the upper and the lower parts of the city was so loud, that in 1891, or three years later, the Legislature passed a rapid transit act, under which, with amendments, all the subsequent proceedings for securing rapid transit in this city have been had. The first scheme concocted by the commissioners appointed under the act was comprehensive and ambitious. It embraced a system of costly underground roads to be constructed by private capital under a franchise for 999 years. This franchise, after a great deal of preliminary discussion and advertising, was offered for sale at public auction in December, 1892, but the only bid for it was one of $1,000, which the commissioners refused to accept.

Negotiations were then begun with the Manhattan Elevated Railway company for extensions and additions to its lines intended to increase their carrying capacity, and for a little while they promised to be successful. The political party in control of the city government favored the Manhattan company, and in view of the increased profits it was going to make, they invested largely in its stock. The public followed their lead, and during the first four months of 1893 put the price of the stock up very much as they are putting it up now. Then came the panic of 1893, and the Manhattan directors, thinking it was not a propitious time to make the necessary expenditures, abandoned the scheme for enlarging their system.

Recourse was, therefore, again had to the Legislature, and in 1894 the Rapid Transit act was amended by the addition of provisions for submitting to a vote of the citizens of New York the question whether or not the city should not construct the required road itself, and lease it, on a plan similar to that suggested by Mr. Hewitt. The vote was taken in November, 1894, and the proposed municipal construction of the road was approved by a substantial majority. The commissioners under the act thereupon set to work and laid out an underground railroad which was to cost, by their own estimate, $50,000,000, and by that of expert engineers $70,000,000. Failing to obtain the needful consents of a majority of the abutting property owners to the construction of the road, they applied to the Supreme Court for the approval which, under the act, would have been a substitute for the consent of the property owners, but this the court, in May, 1896, refused, basing their refusal upon the ground that the estimated cost of the work was beyond the city's ability to pay without exceeding its constitutional debt limit.

The commissioners then revised their plans, and, by changing the route of the proposed road from Broadway to Elm street and simplifying its construction, they reduced its estimated cost to $35,000,000. This new scheme, having also failed to receive the needed approval of the property holders affected by it, was submitted to the Supreme Court, and has just been practically condemned by them in the manner already described. The commissioners are now engaged, it is announced, in preparing arguments to show that the exaction of a $15,000,000 bond from the contractor for the work is unreasonable; but, if they succeed in persuading the court to withdraw its requirements of a stipulation to exact such a bond, they have still to meet the question of the probable infringement of the city's debt limit.

According to the accounts which have been printed in the newspapers of the views which the commissioners and their legal advisers take of the nature and amount of the bond to be required of the contractor or contractors for building the proposed road, the question whether or not the operation of it would be profitable after it was completed has never seriously been considered by them; but they have assumed, as a matter of course, that its net earnings, over and above running expenses, would be amply sufficient to pay the minimum rental fixed by the Rapid Transit act. That minimum is the interest on the bonds issued by the city to pay for the work and one per cent. annually on the principal for a sinking fund. Assuming the cost to be no more than $35,000,000, and the annual interest but three per cent., the annual rental would be four per cent. on $35,000,000, or $1,400,000. Should the cost be $50,000,000 and the interest 3½ per cent. the rental would rise to $2,250,000. That the road would earn even the larger of the two amounts seems never to have been doubted by the commissioners, and their sole anxiety has been to secure the city against loss by the failure of the

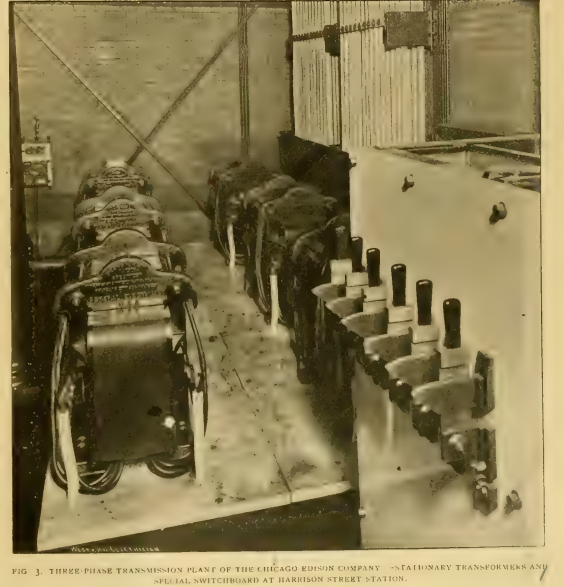

FIG. 3. THREE-PHASE TRANSMISSION PLANT OF THE CHICAGO EDISON COMPANY.—STATIONARY TRANSFORMERS AND SPECIAL SWITCHBOARD AT HARRISON STREET STATION.

contractor to carry out his contract for its construction. Although the act requires them to take a bond for the payment of the rental as well as for the construction of the road, they have apparently intended to take only a small bond to secure the rental. In this respect they have exhibited a laxity common to many business men in like circumstances. When the West Shore railway, for example, was projected, nobody doubted that it would earn the interest on the bonds issued to construct it. It ran parallel to the New York Central railroad, and if it got only one-third as much business as the Central did, it was computed that it would be able to pay its interest and have a handsome surplus. So the Rapid Transit commission

1 From the New York Sun, December 27, 1897.

ers have concluded that since the elevated and the surface railroads running parallel with their proposed road earn large amounts, their road will earn at least $2,250,000, and more besides. The West Shore railway, as a matter of fact, went into a receiver's hands almost immediately after it was finished, and the receiver, finding that he could not make it earn even its operating expenses, was on the point of applying to the court for permission to discontinue operating it altogether, when Jupiter Morgan intervened and majestically compelled the

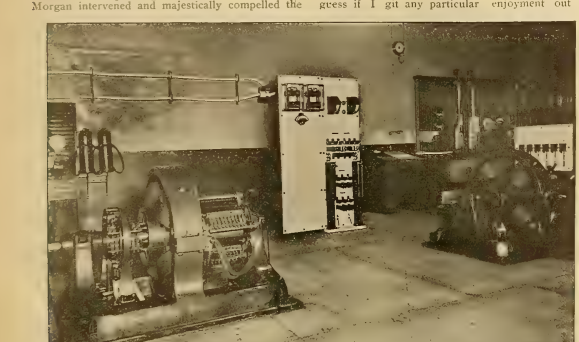

FIG. 6. THREE PHASE TRANSMISSION PLANT OF THE CHICAGO EDISON COMPANY.—ROTARY TRANSFORMERS AND CONTROLLING SWITCHBOARD AT THE TWENTY-SEVENTH STREET STATION.

New York Central to take a lease of the road at a rental of 2½ per cent. on its bonds. The Nickel Plate road disappointed its projectors nearly as much, and was saved only by a lucky negotiation with the late William H. Vanderbilt. Like disparities between promise and performance have been exhibited by the Manchester ship canal, the Isthmus of Corinth canal and the new North German canal, and every investor has to suffer them occasionally.

Prudent men in any enterprise always look the worst in the face and prepare for it. The Rapid Transit commissioners will not be prudent if they do not guard against the possibility of loss by the the city in the operation of their proposed road as well as against loss in its construction. The contractor for the construction must, by the terms of section 34 of the act, agree to pay a rental of not less than $1,400,000 a year for 35 years, and he may have to agree to pay one of $2,250,000 a year for 50 years. In the former case his total liability will be $49,000,000; in the latter it will be $112,500,000. How much security ought to be required for the payment to the city of even the smaller of these sums it is for the commissioners to consider, but nature consolation is likely to convince them rather that a $15,000,000 bond is not enough than that it is too much. They must remember that, if the road fail to earn its rental in the hands of a contractor, it will do the same when the city takes possession of it. The contingency must therefore be provided for of a total failure of the scheme, and the possible loss by it must be assumed by the contractor and his bondsmen and not by the city

Earnings of Minnesota Telephone Companies.

In compliance with the requirements of the state law providing for the assessment of three per cent. upon the gross earnings of telephone companies in Minnesota, the corporations operating exchanges have already made report.

The Northwestern Telephone company has not been able to make its total statement, as it has not yet tabulated the returns made by the 150 stations which it controls. The returns for eleven months, however, show the gross earnings to be $375,000.

The figures given out thus far show the following earnings of the local exchanges in the towns named: Duluth, $75,000; Winona, $9,127.97; Crookston, $2,079.44; Red Wing, $2,523.25; Albert Lea, $1,454.40; Pipestone, $427.50. Fifteen companies have yet to file their report.

Bell Practice Unappreciated.

The Louisville Courier-Journal relates an incident that shows that the telephone is not without its disadvantages. The trouble occurred on one of the new Preston Park and Eighteenth Street electric cars between a colored man and a countryman from Indiana. The countryman boarded the car at Seventh and Main street. The car collected his fare and took a position on the rear platform.

The man from the country soon discovered a small button at the side of the seat, which he proceeded to press. The car stopped, but the farmer signified no intention of getting off. He laughed heartily when the car started, and again began to ring the electric bell.

"Don't you know you are not allowed to ring that bell unless you want the car stopped?" asked the conductor in a gruff voice.

"I paid my fare," answered the other, "and I guess if I git any particular enjoyment out of ringin' yer old bell you haven't got any right to stop me."

With this the troublesome passenger pressed two buttons to show that he was not to be outdone. The conductor then seized him by the nape of the neck and ejected him from the car.

"This beats any town I ever did see," said the farmer. "They talk about havin' new cars fer comfort. I never did see one of them bells, and I just wanted to practice on them a little. That's what a feller gits, though, when he does try to improve himself and act like city folks."

The Telephone in Kentucky.

A green-looking man came to town the other day with a small bucket of very white butter to sell and called on Will Matthis to buy it, says the Elizabethtown News. Mr. Matthis said he didn't want any at the store, but he would inquire if his wife wanted any. So he stepped to the telephone, called her up, and talked for a few seconds through the instrument. Then, turning to the countryman, who was standing with his hands in his pockets, his eyes dilated and his face very red, he told him that his wife said that she would not need any butter. The indignant countryman blurted out:

"Look here, mister, if you didn't want any butter why didn't you say so? I ain't such a fool as to think that you've got your wife in that little box!"

Mr. and Mrs. J. visited town the other day, according to the Louisville Dispatch. The madam is a large, muscular-looking woman, and is evidently the boss of the ranch, while Mr. J. is a cowed, effeminate-looking creature who seems to be afraid when the madam is around. While Mrs. J. went into Goldnamer's to do some shopping the little man slipped off to Bell's to get a drink. While he was down there he heard the telephone ring, and inquired what it was. The mysteries of the instrument were explained, and Mr. Bell offered to call up his wife at Goldnamer's and let him talk to her. This seemed to please him very much, but just as he got the trumpet to his ear the lightning struck the wire and knocked him down. Staggering to his feet he said, "That's her; it sounds just like her."

Telephone News from the Northwest.

[From the Minneapolis correspondent of the Western Electrician.]

J. B. Green has been soliciting subscribers for a telephone exchange in Cambridge, Iowa, and thinks that enough will be secured to justify putting in a system.

The Portage Telephone company is an applicant for a telephone franchise at Janesville, Wis.

M. W. Krueger and M. E. Barnett of Neenah, Wis., have secured a judgment against the Wisconsin Telephone company for damages for placing a telephone pole in front of their store.

The local telephone exchange at Ortonville, Minn., has been reorganized under the name of the Inter-State Telephone company. It connects with the long-distance wires of the Dakota Central Telephone company of Aberdeen.

E. M. Walsh of Crookston, Minn., proposes to form a stock company to construct a telephone system connecting Crookston with Fosston, McIntosh, Red Lake Falls, Thief River Falls, St. Hilaire, Minn., and Grand Forks, N. D. The system is to be ready for use in the early part of next summer.

The Armell and Dog Creek Telephone company will construct a line from Lewistown, Mont., to Wm. Fergus' ranch, 30 miles, with a branch line 22 miles long to the W. H. Fergus ranch.

In the case against the telephone company at Viroqua, Wis., by Baglein, for damages for loss by fire, alleged to have started because of imperfect insulation of the telephone wires, the jury gave judgment for $1,300, but in answering questions in the special verdict gave one answer that practically nullifies the finding, and the court may set it aside.

The Rocky Mountain Bell Telephone company will extend its system from Cascade to Choteau via Sun River and Augusta next season.

The subscribers of the Wisconsin Valley Telephone company of Whitehall, Wis., complain that the company is not using copper wire, and there is also considerable objection to the way its poles are set along country roads. This company is rapidly pushing work on its lines and is arranging to connect over 150 towns and cities in western and northwestern Wisconsin. The telephone sys-

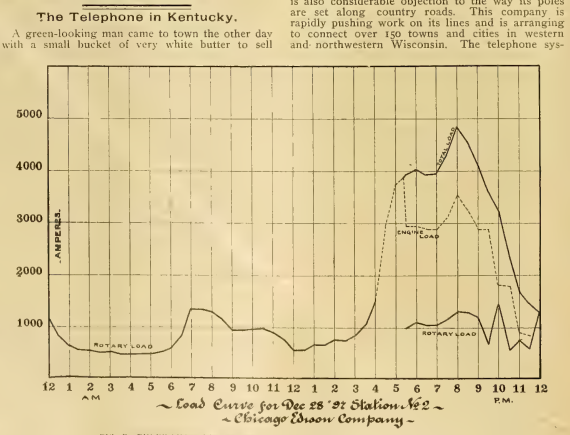

FIG. 7. THREE PHASE TRANSMISSION PLANT OF THE CHICAGO EDISON COMPANY.

tem to be used by this company has been tested at Chippewa Falls and found to be very satisfactory.

The Monad Telephone company has placed a transfer system on its switchboard in Des Moines, which reduces the difficulties of operation considerably.

A telephone line has been completed between Lamoni and Andover, Iowa.

A telephone line is being constructed between Columbia and Chariton, Iowa.

A telephone war is on at Great Falls, Mont. The Electric City Telephone company is a new insti-

tution which has made a rate of $48 for telephones. The Rocky Mountain Bell Telephone company has now made rates of $35 for business and $12 for residence service.

The Indianola Mutual Telephone company of Indianola, Iowa, has been incorporated with $1,200 capital stock.

The Wisconsin Telephone company announces a reduction on long-distance instruments at Marinette, Wis., to take effect January 1st. A single-wire service is reduced from $60 to $50 for business offices and from $42 to $36 for residences.

The Mississippi Valley Telephone company announces that the refusal of the Ft. Madison, Iowa, council to allow its wires to pass through that place will not prevent the building of the line to Keokuk. The wires will simply go around Ft. Madison, and the latter will not have the benefit of telephone connection.

New Heilmann Electric Locomotive.

Nearly four years ago the initial locomotive of J. J. Heilmann, the "Fusée Electrique," made the trip between Paris and Nantes, with a train of 200 tons, and attained a speed of 110 kilometers per hour.

From that time until quite recently the world at large has heard little of the inventor or his work. On November 12th, however, the second engine of this type, the "Heilmann 8001" (these figures denoting number 1 of the new series of eight-wheel trucks) commenced a series of trial trips from Paris over the tracks of the Compagnie de l'Ouest, whose constructing engineers supervised the building of the new locomotive.

The Fusée Electrique was defective in many particulars, and in the present machine the inventor has endeavored to avoid or correct these faults. In making changes duplicates of the several parts assumed to be improvements were built, one of which was incorporated with the old and its fellow reserved for the new machine, in case it proved successful. This form of cut-and-try experimenting has occupied much time, and accounts in part for the almost omnious silence which has been maintained on the subject of the Heilmann invention. This method of procedure, while laborious and snail-like in its progress, had the advantage of bringing out two complete and similar machines at the same time.

An improvement of much importance has been the placing of the trucks nearer the extremities of the machine, which gives it a much lighter appearance than the first, which was very markedly clumsy and stubbed. The changes made have had for their aim:

First—The increase of the total power of the machine, and hence the specific power, while the limit of 15 tons weight over each axle, or a total of 120 tons, is maintained.

Second—To improve the method of hanging the motors. In the first locomotive the motors were placed direct on the axles, with elastic rings of "woodite." These heated badly and metal was substituted; then the shocks of metal against metal were prejudicial to perfect action in the brush contacts.)

Third—Changing the cylinders from a horizontal position, and making their action nearer uniform.

Fourth—Improving the apparatus of the switchboard as suggested by experience.

There is also an improvement in the boiler arrangement, as comparison will show. While the first engine was much heavier its capacity of evaporation was 9,000 to 10,000 liters of water per hour, against 13,500 for the new.

The boiler dimensions are: Grate surface, 3.34 square meters; furnace surface, 16.47 square meters; tube surface, 169 square meters; total heating surface, 185.47 square meters. The number of tubes is 351. The exterior diameter of tubes is 0.045 meter and the length between plates is 3.80 meters. The smokestack summit is 4.20 meters above the rails, and is at the rear of the machine. Nevertheless this can be used as a "doubleender" locomotive, although it is claimed there is less resistance offered to the wind when running with the stack in the rear. Two large water tanks, with a capacity of seven tons, measuring 0.50 by 1.10 by 0.20 meters at the base and 4.90 at the top, lie alongside the boilers, and a couple of coal bins, with a capacity of 4.5 tons, are also placed close by. The water is fed to the boilers by a Friedmann injector.

That portion of the locomotive ahead of the water and coal receptacles, having an outside dimension of 2.70 meters, forms with its sheet-iron shell a closed engine and dynamo room 7.40 meters long, 2.55 wide and 2.40 high. This space is occupied by the two electric generators and one engine, with passageways on either side the machinery, leading to all points requiring the presence of the engineer.

The engine is composed of two symmetrical groups formed each of three tandem cylinders, set at a variance of 120°. The whole constitutes a sort of block, 3.50 meters long, 1.50 wide, and 2.40 high. The high-pressure cylinders are 300 millimeters in diameter. The low-pressure cylinders, below the former, are 480 millimeters in diameter. The six cranks and piston rods are enclosed, and all oiling is done automatically.

To prevent strain and pounding from the vertical thrust of these pistons the most perfect balancing has been found necessary, and has been perfectly accomplished by the broken vibratory action of the special piston thrust.

The compound engines have 1,450 indicated horse power, and are of the Willans type. A Westinghouse brake pump forms part of the steam equipment. The engine is directly connected to two identical generators, with hexagonal fields about 1.60 meters diameter by 0.80 in length, made in separable halves.

The revolving toothed armature has 1.05 meters exterior diameter, is drum wound, and has six carbon brushes.

The two dynamos are run at 400 revolutions per minute, furnishing 920 amperes at 450 to 500 volts—a total of 1,200 horse power. A small four-pole dynamo plays the part of exciter.

The current developed by the two dynamos actu-

J. J. HEILMANN.

ates eight motors mounted on the eight axles of the locomotive. These are so arranged as to thoroughly follow every motion of the trucks without interfering with their action and usefulness.

Variations of speed are accomplished by varying the current from the exciter. Proper appliances for accomplishing this result, as well as apparatus for reversing, etc., are grouped on a compact switchboard under the hand of the electrician. During the trial trips between Nantes and Paris, with an excursion party of 60 engineers, representatives of the press, and the like, experiments were made and every requirement suggested was promptly and perfectly met by successful accomplishment.

The foregoing sketch and the accompanying illustration and portrait of the inventor, J. J. Heilmann, is from l'Energie Electrique.

Electrical Development in Canada.

[From the Ottawa correspondent of the Western Electrician.]

Electricity was first used as a motive power, in Canada, in 1883, at the Toronto Industrial Fair. Three of this city's electric street railway cars were equipped with electric stoves in February, 1892. It is also to be noted that the first electrically cooked banquet was provided in Ottawa in 1892. Electric mail cars, too, were first used in Ottawa, November 9, 1893.

In 1896 there were 30 railways in Canada, the motive power of which was electricity, with 569 miles of railway and an equipment of 947 motor cars, 360 trailers, 62 sweepers and 1,315 motors. The number of miles run during the year was 22,772,631, and the number of passengers carried was 73,972,414.

NEW HEILMANN ELECTRIC LOCOMOTIVE.

The following year, 1884, produced the first practicable electric railroad. The current was taken from copper dips laid in a wooden box between the rails. In 1885 the track was lengthened, and the overhead wire and trolley arm used.

The first city in Canada and in the world to have established in it a special electrical heating service from a central station, was the city of Ottawa, Ont Blarcom a deed of trust on the whole business to secure the issue of $4,000,000 in bonds to be applied as directed by the meeting of stockholders held December 11, 1897.

The electric light plant of the Hartford Electric company at Hartford, Wis., is in running order

Northwestern Electrical Association.

An invitation is extended to electrical men generally to attend the sixth annual convention of the Northwestern Electrical association at the Hotel Pfister, Milwaukee, commencing on Wednesday morning, January 19th. The entertainment committee announces that arrangements have been made with the new management of the Pfister which will insure satisfaction to members and visitors. Direct and alternating current will be provided for exhibits.

One and one-third railroad rate can be secured, conditioned upon 100 certificates of attendance. Frank L. Perry, 510 Marquette building, Chicago, will have charge of the transportation of delegates from Chicago.

The following list of papers has been prepared:

"Practice of Theory," by John C. McMynn of Chicago.

"Present Efficiency of Incandescent Lamps," by John E. Randall of St. Louis.

"Notes on Municipal Ownership," by Fred De-Land of Chicago.

"Physical and Chemical Properties of Volatile Oils in Boilers," by William H. Edgar of Chicago.

"Electric Lighting for Profit," by Alex Dow of Detroit.

"Long-distance Transmission," by Axel Ekstrom of New York.

"Transformers," by E. H. Abadie of St. Louis.

As usual, the programme provides for the entertainment of membesrs and friends during the convention.

Consolidation of St. Louis Lighting Companies.

Papers of consolidation were filed at St. Louis December 27th by the Missouri Electric Light and Power company and the Edison Electric company. First, the Knickerbocker Trust company, as trustee, under a deed of August 1, 1893, sold to A. D. Brown for $914,000 all the property of the Edison Illuminating company, conveyed by the original deed, securing the first issue of $4,000,000 gold bonds of the company. Then the Missouri Electric Light and Power company deeded all its property, stock and belongings to A. D. Brown for $100, subject to two deeds of trust aggregating $1,100,000. In a third deed A. D. Brown and wife deed to the Missouri Edison Electric company for $4,000,000 all the property turned over to Brown by the Missouri Electric Light and Power company deed. The new company gives to the Knickerbocker company and J. C. Van

TELEPHONE, MAIN 1746.

EASTERN OFFICE: 108 TIMES BUILDING, NEW YORK.

Trade Supplied by Western News Co.

COPYRIGHT.—Not only the title but the *entire contents* of each number of the WESTERN ELECTRICIAN are copyrighted. This paper is entered at the Chicago postoffice as mail matter of the second class.

SUBSCRIPTION, in advance, postage prepaid, $3.00 for a full year of 52 numbers; in clubs of four or more, $2.50, with free extra copy for eight subscriptions; foreign countries, $5.00 a year; single copies, 10 cents. When change of address is requested, the old address as well as the new should be given.

CORRESPONDENCE relating to electricity or any of its practical applications is cordially invited, and the co-operation of all electrical thinkers and workers earnestly desired. Clear, concise, well written articles are especially welcome; and communications, views, news items, local newspaper clippings, or any information likely to interest electricians, will be thankfully received and cheerfully acknowledged.

ADVERTISING.—THE WESTERN ELECTRICIAN — **the only general electrical paper published in the West**—thoroughly covers a territory *exclusively its own*. THIS IS A CLAIM WHICH CAN BE MADE BY NO OTHER ELECTRICAL JOURNAL IN THE UNITED STATES. Electrical merchants and manufacturers *desiring western trade* will appreciate the UNEQUALED VALUE of this journal as an advertising medium in its special field. Advertising rates are moderate, and will be furnished on application.

HIGH WATER MARK

CIRCULATION, 20,000.

State of Illinois, County of Cook—ss:

Thomas Jansen, being duly sworn, deposes and says that he is a resident of the city of Chicago, in the county of Cook and state of Illinois, and that he is the foreman of the printing department of the Electrician Publishing company, the publishers of the Western Electrician; that he was present at and superintended the printing of No. 24 of Vol. 20 of the Western Electrician, issued on June 12, 1897, and that there were printed by actual count 20,000 complete copies of said Western Electrician of the volume and number above specified. And further this affiant sayeth not.

THOMAS JANSEN.

Subscribed and sworn to before me this 27th day of July, 1897.
Chicago, July 27, 1897. IRA B. JONES, Notary Public.

The programme for the Milwaukee meeting of the Northwestern Electrical association will be found on another page. It contains promise of a very interesting meeting. The topics to be discussed are matters of importance to the members, and there is no question of the ability or experience of the men selected to read the papers. The committee promises an excellent line of attractions in the way of special features and entertainment.

Two catastrophes that have occupied public attention during the last week are shrouded in mystery, and it seems hardly possible now that exact information regarding the causes of these calamities will ever be obtainable. On Christmas announcement was made of the burning of the Coliseum building in Chicago and the explosion at Jersey City in which two lives were lost, a factory wrecked and many houses damaged. The former was charged to defective electric wiring and the latter to acetylene. The works of the United States Liquefied Acetylene Distributing company, Jersey City, were wrecked by a series of explosions, caused by acetylene gas, and were destroyed by the fire which followed. The immediate cause of the explosion has not been determined. Very little is known about the Coliseum fire which, it should be mentioned, is also attributed to other causes. It is to be hoped that further investigation will be made in both cases, so that responsibility may be fixed.

Preliminary steps have been taken in the formation of an organization of street railway companies of Illinois, and it is expected that a state association will be established on January 5th, when a meeting will be held at the Great Northern Hotel in Chicago. In the proposed reorganization the companies operating street railway lines in the smaller cities and villages throughout the state will co-operate with the Chicago companies in protecting their interests against adverse legislation. The experience of street railway corporations in dealing with the last Legislature has evidently aroused them to a realization of the necessity of united action. It is explained that the new organization will be simply an association for the purpose of taking agressive action in attempting to influence legislation, and to provide a common defense against the passing of laws prejudicial to their interests. It is said that a bill taxing railway companies two per cent. of their gross earnings will soon be introduced in the Legislature, and if it is, the first business of the new alliance will be to fight it.

New York has fondly cherished the hope that some day it would have real rapid transit, but now, it appears, there is no prospect of immediate fulfillment. The plan for the underground railroad from the Battery to the northern end of the island is meeting serious if not fatal difficulties. The Board of Rapid Transit Commissioners, appointed under an act of the Legislature to consider the practicability and cost of the work and to choose a route, completed its report some time ago, in which it was held that the construction of the road was practicable and that the cost would be $30,000,000 to $35,000,000. The board also outlined a route, prepared estimates of the amount of traffic and recommended that the road be built. The court, to which the report was submitted for approval in compliance with the requirements of the law, approved the plans and recommendations of the rapid transit board for the construction of the road, but it held that the contractors should give a bond of $15,000,000 to the city for the faithful performance of their contract. This bond was for constructing the road and operating it for the term fixed in the law and contract. The law provided that the sureties on any bond required of the contractors should qualify in twice the amount of the bond. This would make it necessary for sureties to list property valued at $30,000,000, on which the bond would be a lien for the 35 or 50 year period for which the contractor agreed to operate the road. All this property would be tied up for that time, and, it is claimed, this would work hardship and would be practically prohibitive. It is pointed out, however, that the contractors would not furnish the capital for the construction and equipment of the road, as the city would advance the proceeds of the bonds for this purpose, and that therefore in reality the tying up of the property of sureties would be equivalent only to tying up their capital if they had invested their own money in the work. Another question relates to the limit of the city's debt. Old New York had a wide margin of credit within the debt limitation of 10 per cent. on the assessment, but when it is merged in the greater city it is claimed that there will not be enough margin to permit the new bond issue, as the other municipalities have exceeded their debt limit.

It is feared that failure of the plan now under consideration may discourage the promoters of the project, as the present scheme is the culmination of 10 years' work. The idea was first given definite form by Mayor Hewitt on January 1, 1888, but was not seriously pushed until 1891, and even then very little progress was made. Now, however, after many trials, the plans have been advanced to a point where advocates of the scheme had reason to be hopeful of success, and it will be a sore disappointment if the realization of their expectations is still further postponed.

It has been judicially determined that the position of city electrician of Chicago comes within the scope of the civil-service law, and it is announced that an examination of applicants for that office will be conducted this month under the supervision of the civil-service commissioners.

In the meantime it is said that the electrical bureau may be separated from the fire department and made an independent bureau with a head of its own. Mayor Harrison has read the Supreme Court decision on the civil-service test case, and he believes that an ordinance establishing the new electrical department can be so worded that he may appoint the head of it with the consent of the City Council. The new electrical department has been discussed for some time by city hall officials. The bureau, as it is now organized, is the result of the use of the fire-alarm system and has always been connected with the Fire Department. Since its establishment, however, it has been extended until the superintendent of city telegraphs now has charge of all the wires in the city, the enforcement of the laws pertaining to them, and the superintendency of the municipal lighting stations. The corporation counsel is said to be working now on an ordinance for the establishment of the new department.

Mr. Edison has again freed his mind upon the subject of patents and inventions, but he has added little or nothing to the store of general knowledge. In a newspaper interview the great inventor said that "the value of a patent to an inventor is directly decreased as the value to the public increases. The practice of the United States Circuit Court is such as to drive all the inventors away from revolutionizing inventions into little details." There is marked inconsistency, however, for in another part of the interview Mr. Edison is quoted as saying: "The laws are all right and don't need revision. It is not the laws. The Patent Office is all right too. There is no corruption there. It all lies with the power and practice of the United States Supreme Court. Years ago they would grant an injunction on the face of the patent. The patentee had better rights. Now they don't, and that is what is driving every good man out of the business, or driving him into details, because they are safe. If you get up a wrench there is not the danger of another man coming in and spending $200,000 or $300,000 fighting you on a thing which don't pay you $5,000." Again, Mr. Edison is reported as saying that instead of taking out patents, inventors should guard their discoveries as trade secrets and in the same breath expressing the following conclusion: "A man ought to patent every part of his machine which he intends to use, so that he will have a bona fide claim to use it, and cannot be infringed by other inventors. The inventor should first patent the principal parts and improvements, then patent the variations and completed model, to protect himself in the courts of law."

The fact of the matter seems to be that, while the patent system of the United States contains many defects and has often been abused, it still remains the best that has been devised, and it has contributed largely to the material advancement of the country and furnished protection and a means for securing reward for worthy inventors.

THE RECORD AND PROMISE OF THE ELECTRICAL INDUSTRY.

1897—1898.

It is very gratifying to record, in this New Year's edition of the Western Electrician, the undoubted fact that the electrical industry, in all its technical and commercial departments, has made a fine, healthy advance during the year. Comparing the condition of affairs to-day with that of a year ago, anyone who is familiar with the trend of electrical development must fairly acknowledge that the improvement has been a great and conspicuous one. Last New Years everybody was hoping, with some mental reservation of doubt, that there would be a betterment in the long depressed electrical trade; now it is known beyond question that the industry is in a far better position in every direction. The improvement was especially marked during the last three months of the year, and 1897 came to an end with confidence restored, a large comparative volume of goods sold, and much better collections. Better still, all agree that unless some unforeseen contingency arises, the year now entered upon will show a continued increase in the growth of the business—a healthy, natural recovery, not a speculative boom—and that an active demand for electrical products is indicated for several years. It may be well to suggest that in this renewal of industrial activity in this country the electrical manufacturers should not neglect the export trade, which has been so notably developed during the hard times at home.

Technical development is of course largely dependent upon industrial conditions. With improved prospects in the business world, the year has witnessed some interesting phases of the advancement of engineering thought. One is the conspicuous increase in the use of storage batteries for power stations; another is the marked activity in the development of large water powers by electrical transmission; a third is the change in the attitude of heavy-traffic railroad engineers toward electric traction; a fourth is the initial development of the multiple-unit system of electrical train operation; a fifth is the increasing employment of rotary transformers in combinations of alternating-current transmission and direct-current distribution for both railway and lighting service, and still another is the discussion of the 220-volt lamp question. In telephony the independent movement has advanced with vigorous strides, and the long-distance service has been greatly increased and extended. In the telegraph service, the report of the largest company shows a slight decrease in business compared with some former years. The year has witnessed one very important step in advance—the general adoption of the National Electrical Code—and two important patent decisions, one dismissing the government suit to annul the Berliner telephone patent and the other declaring the Vandepoele underrunning trolley patent invalid. The electric vehicle has been greatly improved and has shown that it has come to stay, while electrical cooking and heating has made progress.

Several of these subjects are briefly treated in the subjoined articles by contributors competent to speak with knowledge. No doubt many readers of the Western Electrician need no introduction to any one of the gentlemen who have kindly helped to make this issue of value; but it may not be amiss to say a word or two about each.

As general superintendent and electrical engineer of the Chicago Edison company, Mr. Ferguson is well qualified to write of central-station work, to which he has given years of study and in which he is a recognized authority. Mr. Arnold's work as a builder of electric railways and in general engineering practice is well known. He designed the power house of the Intramural railroad at the World's Fair and many other plants, and is the author of "Design and Construction of Electric Power Plants." Mr. Pierce is another of the leading electrical engineers of Chicago. At the World's Fair he had charge of the great electrical plant—undoubtedly the largest in existence at that time. He has a wide general experience and an extensive electrical acquaintance. Mr. Hibbard holds the responsible position of general manager of the Chicago Telephone company. He is vice-president of the American Institute of Electrical Engineers and his active mind touches on many problems of electrical endeavor. Mr. Clark is an experienced electrical man, formerly engaged in central-station management, but now the Chicago manager of the Electric Storage Battery company. Mr. Wallace is equally well known East and West, and as one of the western representatives of the Stanley Electric company in Chicago has given the subject of which he treats deep attention. Mr. Merrill has a national reputation as an expert on all questions growing out of the relations of the insurance and electrical interests. He is in charge of the Electrical Bureau of the National Board of Fire Underwriters, and his office is in Chicago. Judge James M. Thomas of Chillicothe, O., is the president of the Independent Telephone association and also of the Home Telephone company of Chillicothe. He is one of the most prominent figures in the independent telephone movement, which he indefatigably promotes. Mr. Corrigan is the manager of the American Electric Vehicle company of Chicago, and is one of the most active and intelligent of the exponents of the new industry in which he is engaged.

Central Station Advancement.

By Louis A. Ferguson.

During the year just closing much has been done in the development of the central station for the general distribution of electricity for lighting and power, both through radical changes in engineering methods and the gradual evolution and improvement of the apparatus and methods generally employed during the past few years. Looking backward only four years to the time of the World's Columbian Exposition at Chicago, we may remember how at that time it was generally considered that there was little prospect of any important change from established methods and apparatus then employed in central stations. Since that time, however, there have been marked changes and improvements in machinery, appliances and systems, through which the economy of electricity from central stations has been largely increased and their field of operation has been greatly widened.

The development of the electric elevator has done much to further the interests of central-station business, and the success of the electric elevator has been largely due to the lively interest taken in it by central-station managers and engineers and the appreciation of its value to them in the extension of their business in lines heretofore considered by many beyond the reach of the central station. The electric elevator is, in the hands of the central station manager, the key to the solution of the much discussed question, "Central-station supply versus the isolated plant."

It has been the firm belief of the writer for many years that the installation of isolated plants within the territory supplied by the central-station companies is, in the majority of instances, a mistake, when considered from a conservative business as well as engineering point of view. This has been most conclusively proven during the last few years, and especially during the year just closing. In Chicago, where many of the largest mercantile establishments, office buildings, hotels and railway companies have, after many years of operation, abandoned the use of isolated plants and contracted for their lighting and power serv e from the central-station company. The prominent architects of Chicago are so thoroughly imbued with the advantages to be derived from central-station supply that all the important buildings now being designed for low-pressure heating with natural gas as fuel, the ventilation is effected by electrically driven blowers and fans, and electricity supplied from the central-station mains operates the entire remainder of the equipment in the building. Direct-connected electric elevators are chosen both for passenger and freight service; the water for toilet rooms is furnished by electrically operated and controlled house pumps; the refrigerating and cooling also is provided for by ejectors operated and automatically controlled by electricity. The lighting, of course, as well as any power for special purposes in the building, is supplied by electricity from the central-station mains. In the case of office buildings or other buildings where there are several tenants, each tenant is supplied through independent meters and deals directly with the central-station company; thus the owner or agent of the building is relieved from the annoyance of engaging in a business in which he is not skilled and the office tenant is supplied with electric light at from one-third to one-half the amount charged these tenants in other buildings operating their own electric light plants.

Experience in Chicago has demonstrated that the day of the isolated plant in the central-station district of a large city is past, and the cases are very exceptional and must be surrounded by extraordinary conditions where an isolated plant may be operated at a cost, everything considered, less than the price at which it is possible for the central-station company to supply a better service and obtain a fair return on its capital invested.

In many cities and towns the competition of the Welsbach light has made an impression, and many of the companies have been at a loss to know how to compete successfully with this rejuvenator of the "good old gas." The Welsbach is, of course, a "hard times light," and no one would use it were it not that it affords a ready means of reducing expenses. To satisfy that class of people who are willing to use so cheerless and unnatural an illumination we must offer something that is economical as well as attractive. The year just closing has given us the successful small enclosed arc lamp, which, operating at three amperes, gives a better illumination without diminution of candle power for less money than the Welsbach burner.

It has always been argued that one of the great advantages of the series arc lighting business is that the load curve of the station has little or no peak, and the cost of operating and investment required should, therefore, be less than in low-tension stations, where the product is sold entirely by meter. There is no reason, however, why this principle may not be applied to low-tension stations as well, and the writer, two years ago, with this idea in view inaugurated, in connection with one of the low-tension stations under his charge, a system of commercial arc lighting on a weekly contract basis at a moderate price, adding to this one station alone upward of 700 low-tension contract arc lamps, some burning from dusk till 10 o'clock and others from dusk till midnight, and all being switched on and off by the company. This system has become exceedingly popular, and has resulted in so increasing the output that the load factor of the station is now 75 per cent. during its period of operation.

Municipal arc lighting from the low-tension three-wire mains is done in the East. In New York the Edison company furnishes the city lighting for Fifth avenue and many of the cross-town streets. In Brooklyn also the Edison company is doing a large business in municipal arc lighting from its three-wire system.

From an engineering point of view perhaps the most radical change and the greatest advancement in central-station practice and development has come from the proposed abandonment of all the steam generating stations in the various parts of the city and consolidating the steam plant and generating apparatus in one or two large central stations located on the water front, where multiple expansion condensing engines can be employed and where cheap fuel may be obtained. The electric energy for supplying the entire city and suburbs will then be generated at the main station on the water front and will be transmitted to various sub-stations located at proper points throughout city and suburbs. The energy generated will be either two or three-phase alternating or both direct current and alternating, according to the location of the generating station relative to the district of greatest demand. The transmission to the sub-stations, over one mile distant, will be by means of three-phase alternating current transmission lines at voltages dependent upon the distance. At the sub stations the voltage may be lowered by static transformers, the current rectified by rotary transformers and distributed to the city by an Edison three wire direct current network, if it be thickly settled. When the territory of the substation is scattering, however, a system of high-pressure alternating current feeders and step pressure secondaries would be employed. In many of the sub stations it may be found advantageous to operate series arc dynamos for municipal or commercial lighting, and in such cases the rotary transformers may be provided with pulleys and used to drive the arc machines at the same time they are converting the alternating to direct current. Synchronous motors taking current at the full line voltage may also be used to drive arc or other machines in case the sub-station be a purely arc station. The efficiency of the various systems combining the use of alternating and direct current ranges from 74 to 85 per cent., according to the method employed, and, compared in point of cost of operation with the old plan of many steam stations scattered about the city, the economy is very pronounced. Two-thirds of the cost of the fuel in the steam sub-stations and all the labor and supplies incident to the operation of its boilers and engines may be saved, and during 16 or 18 hours each day the rotary transformer or synchronous motor sub-stations may be operated with only one man and without any additional labor in the main station.

In our American stations the use of large storage batteries is increasing, and each year adds several

important installations to the list, some installing them because they believe them economical and useful to carry the peak in winter, others because they desire them as a guaranty for continuous service, thus protecting the consumer in much the same way that a bank protects its depositors by maintaining a cash surplus.

The question of rates and tariffs to central-station customers has been one of the most important questions under discussion during the year. There has been a constant tendency toward lower prices for current and a tendency toward revision of prices and methods of charging for current in the large cities, and experiments are now being conducted by several of the large companies along the lines laid down in the Wright demand system and the Kapp two-rate system.

The development of central-station systems along the lines herein outlined, employing alternating current for transmission and direct or alternating current for distribution, alters very materially the position occupied by many of the companies, enlarging their field of operation, developing their possibilities for greatly increased business, and by proper consolidation and good engineering may render prosperous companies which have for years been non-dividend earning properties.

The business of the central-station companies in all the large cities during the latter half of 1897 shows very large increases in output over the same period of 1896, demonstrating the strength of their position and indicating a very prosperous future for them and naturally a brighter outlook for the electrical business in general.

Isolated Plants.

By R. H. Pierce.

In the last few years we have seen in the electrical journals numerous articles on "Central Stations versus Isolated Plants." The discussion reminds the writer of the old question so popular with country debating societies, "Is the pen mightier than the sword?" Notwithstanding the floods of eloquence that have been poured forth in championing one side or the other of this momentous question, the manufacture of writing materials and more material weapons have both survived and both appear to be on the increase. So, notwithstanding the literary efforts of the man who says "Why buy light when you can own your own plant?" or his opponent who thinks he can see the finish of the central station, the sale of electricity from central stations and its production by isolated plants both seem to be popular and both are on the increase.

Only this imaginary antagonism makes excusable the repetition of the truism, which ought to be apparent to all, that there is a broad and profitable field for both methods.

Discussions have had little effect on progress of either. The question confronting the consumer is simply, "How can I get satisfactory electrical service most cheaply?" In solving this, he does not deal with the generalizations, but simply figures the relative cost of the two methods; at the same time, of course, considering the relative reliability and quality. Of course two men may figure out different results and come to opposite conclusions regarding the same case. This, it may be claimed, shows that after all the question is one for debate. To the writer it seems to indicate simply that each case should receive careful, impartial and intelligent study. With such study, in about 99 cases out of every 100 the advantage of one method or the other is clearly apparent. No doubt many an isolated plant has been installed where the owner would have saved himself much expense and trouble by buying current of a central station [illegible], a man has taken current from a central station and paid much more than it would have cost him to produce it.

Between the central station man, with figures demonstrating the enormous expense of operating a plant, and the machinery man, who figures out the absurdly small cost of doing the same thing, the consumer [illegible] pardoned if he is not always able to [illegible] weight to the many "facts" presented to him. We must not, however, judge the art by these errors, but rather by what the experience of good engineers and good business men has [illegible] the best practice.

As this journal will contain elsewhere an article on central stations by one of their most ardent and able champions, the writer will simply accept the isolated plant as a firmly established factor and allude briefly to a few of the reasons for progress made in the past year.

There are many conditions which favor the installation of isolated plants, but in most cases some one or two things decide whether or not it shall be installed.

In large store, office, hotel, theater and public buildings, as well as in many manufacturing buildings, the fact that the buildings are to be heated by exhaust steam decides the question of plant or [illegible] plant. As long as the [illegible] for steam for heating purposes is in excess of that required for running an engine, the cost of the additional fuel required to make [illegible] may be practically [illegible]. Since in a [illegible] plant the heaviest [illegible] is done in the month when the most [illegible] done, i. e., when the above condition [illegible], the average cost of fuel per kilowatt per year is often very low. Even recently it has been argued in one of the electrical papers that this saving is largely theoretical, but if we take the guess of a intelligent engineer who runs a plant and the speculation of the literary gentleman who discusses economy in technical language, we will find that the coal bills will show that the engineer's guess is the better guide for the man who pays the bills.

The real question is how we shall decide in a given case whether to install a plant. The answer is easy. The central-station man will figure for you the cost of buying current and will fully set forth the advantages of doing so. The other side of the problem is simply for the consumer to figure the cost of producing his own electricity and then compare the two estimates. If the consumer cannot figure this out to a certainty, he need not be discouraged, for there are plenty of electrical engineers who are only too willing to do it for him. Most cases can be settled by very rough figuring, but if the case is a doubtful one, then the proper course is to lay out a regular load curve for the plant. If the service is already being furnished by a station, this may be done from measurements. In the case of a new building, however, it is necessary to assume certain loads for the various hours of the day and construct an imaginary load curve, then select the machinery and apparatus of proper sizes to suit this curve and then figure out the cost of plant and cost of operation.

The "load factor" will determine whether the plant is a good investment or not; i. e., the ratio of the average load to the maximum load will determine both the cost and the economy of the plant. As both cost and economy may vary over a very wide range, it is not safe to take an average offered by either friend or foe on isolated plants. Each case should be figured out as a special case. Where this is carefully and honestly done, the actual investment and cost of operation both come much nearer to the estimated investment and cost of operation than can be obtained by studying the average results of other plants.

The reasons why operating an isolated plant must, in many cases, be more economical than buying current are:

First—Many of the isolated plants have as great a capacity as central stations which pay.

Second—Very often the load factor is better.

Third—There is often a great saving, due to the use of exhaust steam for heating, etc.

Fourth—In many buildings and manufacturing establishments, the operation of an electric plant calls for but little additional labor, and that not of a high grade, and if it does call for a better chief engineer, he usually saves more than the difference in his salary.

Fifth—The isolated plant usually costs less per kilowatt, owing to the fact that no capital is invested in costly distribution circuits.

Sixth—The depreciation of plant ought to be, and usually is, less.

The reason that we can expect an increase in isolated plants is that many consumers in the past, especially in the hard times, have been deterred by first cost, and as machinery has grown much cheaper we ought to expect more investments as prosperity returns. Again, in many cases the interest on the investment has proved a large fixed charge in estimating operating expenses of plant. With cheaper machinery and a decreasing rate of interest, we may expect many to revise their figures.

The most promising field for the past year, and one which so far from being exhausted is little more than opened, is the installation of isolated plants for operating factories by motors directly connected to individual machines, or operating groups of machinery. This is a most promising field. Much has been written regarding the efficiency of electrically driven machinery; perhaps this subject has been already more than sufficiently covered; but it does not take much calculation to see that when in many factories 60 to 85 per cent of the total power used is consumed in running idle shafting, ropes, belts, etc., there is a good field of operation in remodeling and rebuilding factory plants. If the question of efficiency were the whole thing, then we might find many cases where the efficiency could be greatly improved by redesigning the transmission system, without using electricity, and with, perhaps, a smaller expenditure than would be required to equip a plant with generators or motors. Investigation shows, however, that efficiency is not the whole thing, and often is not the main thing. The advantage of the use of motors means the saving of space, the better grouping of machinery, better control of speeds, convenience in handling materials and safety to operatives due to the absence of shafting, belting, pulleys, etc.

Electrical transmission in manufacturing plants is cheapest because it is best. In many factories the cost of fuel for power is not more than five per cent of the cost of labor. In such cases a method of applying power which will increase the efficiency of the labor five per cent. is better than any improvement in the old way, even if the efficiency of the electrical transmission is only one half that of the old method. It is safe to say that in most cases a properly designed electrical transmission plant will give an increased efficiency over old methods (i. e., effect a saving in fuel) and at the same time increase the producing capacity of the factory sufficiently to make the electrical plant the best paying investment that can be made. Such plants, from their location and from other other well recognized reasons, are usually isolated plants. Space and time do not allow our going into detail, but it would be interesting if the manufacturers would give a statement of the comparative number of motors and lamps sold for central-station and for isolated-plant use in the past year.

The writer does not advocate the installation of isolated plants except where their economy can be clearly demonstrated. He does not wish to pose as the champion of isolated plants versus central stations, but he does believe, and has always contended, that the isolated plant offers a field of work well worthy of the best efforts of any engineer, and his experience in the year that has passed leads him to believe that the field is constantly widening.

The Electric Railway of 1897 and 1898.

By B. J. Arnold.

During the year 1897 the most important development in the electric railway field has been the application of the third-rail system to steam railroad service, as exemplified in the installation of the Nantasket Beach line of the New York, New Haven and Hartford Railroad company. In this installation it has been proven that heavy railway trains can be handled successfully, reliably and with more satisfaction to the traveling public with electric power than with steam through the intervention of the independent locomotive. It has been but four years since the Intramural railway at the World's Fair was placed in successful operation, yet since that time electricity has been adopted as the motive power by all the elevated railways in Chicago, and it seems probable that we shall see, during the year of 1898, a number of the present suburban steam lines equipped electrically, following the lines laid down on the Nantasket Beach road. The Illinois Central Railroad company is at present figuring with a fair certainty of adopting electricity for its suburban service, for it is said that the company believes that it can give a better service to its patrons with electric power than with the present steam power.

The past year has also brought out the application of the storage battery on an extended scale for the propulsion of street cars, with the batteries carried upon the cars, thus making each car an independent unit, the exemplification of the ideal in railroad work. This system has been in operation for a little over six months on the Englewood and Chicago electric railway, with successful results so far as public service and economy in operation are concerned, although the relative cost of operation as compared with the trolley system has not been made public. The batteries, however, have shown excellent service, and the promoters of the enterprise have reason to feel satisfied with the results.

The year 1898 will probably see many applications of the storage battery as an auxiliary in the power stations of electric railways now in operation, for the advantages to be derived from the use of the batteries in this field are just now beginning to be realized by railway operators, as shown by the fact of their adoption for such work on a large scale at Philadelphia, Pittsburg and Cleveland, following their extensive application as auxiliaries to central lighting stations in Boston, New York, Brooklyn, Cleveland, San Francisco and St. Louis.

When it is recalled that but a few years ago to have been known as looking with favor upon the storage battery as having any value whatever was suicidal to one's reputation for sanity and engineering judgment, their extensive adoption and approval at the present time by the best engineers and most solid business establishments brings satisfaction to the few who were engaged in missionary work in this line. Especially must this be so with Mr. C. O. Mailloux, who advocated strongly in practice and with his pen the use of batteries as they are now being installed in many cases, but who had the misfortune to advocate their use nearly a decade ahead of time, on account of defects in the batteries themselves and the lack of proper commercial backing to substantiate the correctness of his ideas.

During the coming year the efficiency of the Sprague multiple-unit system, by means of which each car becomes a motor car, will be thoroughly tested upon the South Side elevated railway of Chicago. If the details of this system do not prove too complicated for reasonable maintenance, and it seems to the writer that they will not, it will prove the ideal system for elevated railway work.

For long-distance, cross-country lines the use of the three phase current generated direct from dynamos at 5,000 to 10,000 volts, and distributed by means of aerial lines at this potential to sub-stations, thence through rotary converters and battery auxiliaries to sections of trolley line from 10 to 20 miles long at a direct pressure of 600 to 1,000 volts, seems fairly reasonable to expect. In fact the details of such a system are worked out, ready for construction, by means of which 100 miles of railway is to be driven from one central station, and from careful estimates made upon the cost and operation of such a road, it is proven that it can be constructed and operated for less money than the present trolley system at 600 volts. With such a system the battery sub-stations act as equalizers by taking the increased load when the train is on any given section and maintaining practically a constant load upon the power station. The batteries, also, when large

enough to act as such regulators, have sufficient energy stored in them to continue the operation of the cars upon the system long enough to bridge over any ordinary breakdown in the power station, thus making the system more reliable than the present trolley system.

For city work the underground conduit system is proving itself successful in New York and Washington, and from this time forward it will be a battle between the storage battery mounted directly upon the cars and the underground system, and the year 1898 will probably demonstrate which is to be the victor.

Condition of the Horseless Carriage Industry.

By C. E. Corrigan.

It is to be remembered that before entering this field of enterprise one obtrusive fact demands and must receive due attention—the fact that there never was a great discovery or a valuable invention or any other really good thing that did not go a begging for recognition among experts and the general public and have to fight its way to acceptance.

But our difficulties have already been largely overcome. Those primitive motive powers, the patient ox, the mule and the horse, have been deposed in many fields of transportation and their successors have been and are being supplanted in turn by electricity, and people have begun to realize that electricity is the natural medium for the application of motive power. Its supply is unlimited. It is everywhere. It is to movement what the sun is to growth.

Meanwhile other methods and materials for producing power for horseless vehicles are seeking recognition. The gasoline and gas engines have and will have for some time to come a distinct field of usefulness, and they aid very materially in increasing and intensifying the demand for good streets and roads, the want of which constitutes one of the difficulties that is being overcome. The more populous the territory and the more enlightened the population, the better the roadways. All these wants are working together—in these days very rapidly—toward fruition. The good-roads question is a very live one at this time. For this the horse will also be thankful. Certainly we have to combat a greater or less sentiment in his favor; and we do it with poor grace, for he who does not appreciate a horse lacks something of being a man. Nevertheless, it is true that the horse is a much overloaded and abused animal. The meanness of mankind is illustrated in the too heavy load, the too long journey and the bad roadway, and the horse is beaten or encouraged into meeting these conditions and supplying all deficiencies. Some of his admirers might easily think that it is time he was relieved, somehow, from as much of this surplus of burden as constitutes cruelty. Good roads will help both him and his owner. Certainly there are places where we cannot altogether spare him. There could be nothing inspiring in the sight of a plump and splendid brigadier-general, waving a battle-scarred flag and cavorting around at the head of his troops on a bicycle; and yet there are a few young people of various ages who think the bicycle, too, has its place, and they, likewise, favor good roads.

One of the difficulties we have been overcoming is involved in the tire question, which it was the province of the bicycle to develop. True, the making of tires is an independent field, but the result is important to us. After long and thorough tests on passenger and freight vehicles, we find that for the luxurious family carriage or the buggy, and with smooth, clean pavements, the pneumatic tire is the proper thing, but for parcel-delivery wagons, under more or less strain of burden or roadway, the cushion or the solid tire is much better, and both meet their own conditions effectively. It took a little time to learn this, because the public always demands extreme conditions the utmost immediately. But this again encourages effort and helps progress. For instance, customers asked us for a vehicle that would run all day with one charging of the batteries—and this must not increase their weight. To meet these conditions we succeeded in getting batteries that will run a wagon on fair roadway from 40 to 60 miles a day with one charging, while at the same time of about one-third the weight and bulk of anything else we have been able to learn of. With frequent stops and over various sorts of roadway the wagons now in use for several months by a prominent silk merchant of Chicago have averaged per wagon 37 miles per day, as registered by the rodometer. This method of ascertaining distances is one the owners of horse delivery wagons should adopt before too positively stating the totals. The owner says that the electric wagons travel much faster, stop quicker, start easier and do much more work in a day than any horse wagons he has had experience with.

All the same, this is an extreme test. The last part of a discharge is more wearing on the batteries and it is always more satisfactory to have plenty of power in reserve. A given amount of force is more effective if backed up by a surplus of volume. The daily working and the overworking of a man's muscles or his brain illustrate this truth; therefore we have found it economy to use duplicate sets of batteries or to recharge the one set, say at noon when the horse would be eating. Nature is always making valuable suggestions, which help us to overcome difficulties.

Direct current of 110 volts can usually be obtained, but for livery stables or large mercantile houses a gas engine and generator will be found more economical. A difficulty now being rapidly overcome is the want of a sufficient number of large power supply plants, which will reduce the expense of current to the minimum. No doubt the needed plants will prove very profitable investments, so very general and various are the uses to which electricity is being applied. A gentleman who probably has as much capital invested in such power plants as any man in this country told me that electric power could be profitably produced and delivered at a cost of one cent a kilowatt-hour—a statement which I confess astonished me and the correctness of which I could not have accepted as probable had it come from a less reliable and disinterested authority. This being a utilitarian age, in which the greatest economy in producing the greatest result is the all-important question, such a fact as the above seems to contain in itself the rapid solution of our remaining difficulties.

The Telephone in 1897.

By A. S. Hibbard.

The year 1897 has been of especial interest in the field of telephone engineering. Plans for the operation and maintenance of large telephone exchanges which were proposed, and to some extent put in operation during the two or three years previous were, in 1897, combined and concentrated in the one general scheme which has been widely adopted, and in a number of important exchanges put into successful practice. The principal feature involved is the operation of the entire plant for signaling and transmisison of speech from one central battery located at the telephone exchange. This dispenses with the small primary batteries at subscribers' stations, as well as with the magneto crank-handle generators which have been used for so many years. The telephone user signals the operator by the movement of the switch on which the receiving telephone is hung. Removing the instrument from the switch or hook lights a small incandescent lamp before the operator. The insertion of the answering plug puts out the calling lamp, and during the conversation, a similar lamp guards the pair of cords used in completing the connection. If the cord lamp is flashed, the operator responds. If it lights steadily, she disconnects the circuits. The operator is thus directed in all her movements by a visible signal controlled by the telephone user. A most decided and substantial improvement in service has thus been accomplished. The apparatus which has been devised and manufactured to accomplish these results, consisting of relays of various forms for the different uses, repeating coils, low-voltage lamps, sockets, spring-jacks and keyboard apparatus, is most ingenious and perfect in its operation, and in its detail represents a great advance and improvement over anything previously manufactured.

By means of the perfected signaling devices the work of handling trunk calls from one exchange office to another has been greatly expedited, and this service is now made so rapidly and so surely that it is not possible for the user to distinguish between a trunked call and one completed by one operator.

The establishment of a sufficient number of branch offices to accomplish the best economy in the wire plant is thus made possible, a result which also increases the efficiency of maintenance. In large exchanges the wires have been concentrated still more in cables laid in subway ducts, being brought out in short distributing lines, and the large majority operated are now metallic circuits.

Central office power and battery plants have been greatly extended and enlarged, storage batteries being used charged by motor-dynamos with gas engines for reserve power.

Party lines for residence service have been extensively introduced during the year on plans for selective signaling which (with the wire plants as now maintained) have been found efficient and satisfactory.

New York city continues to head the list of exchanges in the country, having nearly 20,000 telephones in operation, while in Chicago, with about 15,000 telephones, the number of daily calls continues to be greater than in any exchange in the world. In Chicago also a greater area is covered by the exchange, and it is found that an average of 3½ miles of wire is used in each connection. As the daily number of calls is about 220,000, it will be seen that 770,000 miles of wire is connected up daily in Chicago for telephone calls, or enough to reach 30 times around the earth.

Long distance and other toll line systems have been greatly extended during the year. Minneapolis, Omaha, Kansas City and St. Louis now represent the western limits, Nashville and points in Alabama, the south; while all Atlantic seaboard cities are connected by direct lines. On the Pacific coast long distance lines extend from Washington and points in Oregon to San Diego, and the growth in the number of telephones has been unprecedented. In San Francisco various classes of service are offered on the toll or measured-service plan, each message being paid for at the time service is given, and the year closes with 11,000 telephones in use in that city.

Throughout the entire country the value to the various communities of reliable and efficient telephone service has continued to increase. More telephones have been installed than ever before and their daily usefulness has increased. In providing for this vast service of inter-communication, now amounting probably to 100,000,000 conversations yearly, no previous year has shown such substantial advances and improvements as 1897.

The Independent Telephone Movement in 1897, Its Development and Organization, and Its Prospects for 1898.

By James M. Thomas.

The independent movement for 1897, the year just closing, already forms a most important chapter in the commercial history of this country.

The popularity of the movement can no longer be doubted. No enterprise has ever been more welcomed by the people, who have had its advantages fully demonstrated. The year 1897 has proven that a better telephone service can be furnished at half the cost paid before this movement started, and the investors rewarded by a handsome profit.

People who have watched this movement know that the telephone is fast becoming a necessity, not only in the large cities but the small ones, even the villages; not only in the business house but in the residence; not only in the municipalities but in the rural districts. They also know that having become a necessity the exorbitant prices heretofore charged will not be tolerated. They also know beyond a doubt that the independent telephone has come to stay, and that its usefulness will become greater as the number of users increases.

The development of this enterprise in 1897 has been wonderful. Exchanges and toll lines have been built all over the United States, and many franchises have been granted for exchanges not yet built. Many small cities heretofore without the advantages of the telephone have been furnished with service, not only among their own citizens, but have been given connection with other cities.

The larger cities have become interested and many have built exchanges. Franchises are being granted in others, and it can be truly said that the year 1897 marks the beginning of the movement in the larger cities. Detroit, Fort Wayne, Mobile, Sacramento, Cleveland, Baltimore, Newark, Richmond, Norfolk, Grand Rapids and other large cities have demonstrated that the movement can be successfully carried on in larger municipalities. St. Louis will open the largest independent exchange in the United States within the next six months.

The enterprise has been taken up in Chicago and New York. The underground work for the new exchanges in Saginaw and Bay City, Mich., is about completed, and hundreds of exchanges scattered throughout the union are now in process of construction, while toll-lines and long-distance connections are being built in all directions. The close of the year 1897 shows a great advancement in this movement.

More than $25,000,000 is already invested in independent telephony. There are about 1,100 exchanges in operation and in process of construction. There are about 600 franchises granted in cities where exchanges have not yet been built. There is over 20,000 miles of toll-lines now completed, owned by the independent companies and many thousand miles in process of construction.

The output from independent factories has increased to a surprising extent in 1897, and many new factories have entered the field this year. Others are ready to start with the new year.

The improvement made in the telephone apparatus during the year 1897 is not only encouraging but shows the ability of the men to compete in an open field where there is a reward for inventive genius.

Inferior telephones and switchboards have been replaced with improved apparatus, until now the greater part of the independent exchanges have equipment equal, and in some instances superior, to exchanges owned by the opposition.

The independent telephone movement has not only advanced itself, but the opposition has been spurred to new energy. Slow service is no longer tolerated in cities where exchanges both of the independents and opposition exist. The operators must be quick, obliging, courteous and pleasing. An all night service is now required in smaller cities where, before the independent exchange came into being, a day service was only given.

The number of telephone users has increased about five fold in cities where there are two exchanges. The independents have, at 50 per cent. of the rate of the opposition, succeeded in placing from two to four times as many telephones as were operated by the opposition before they entered the field, and the opposition has succeeded, by giving free service, in increasing their numbers.

Thus the education of the people in the use of the telephone has been very rapid, and the cheapness of its service has brought it within the reach of the masses of people.

It is a remarkable fact, even at this, the close of the year 1897, about three years since the beginning

of the independent telephone movement, that in cities where there is no competition the people are furnished very poor telephone service. This is only because they have no knowledge of the great benefit to be given them by competition, not only in service but in reduction of cost.

This movement reached a point early in 1897 of such great proportions that those interested in its welfare recognized the necessity of organization. The history of all other enterprises showed clearly that this was essential to the welfare and progress of this movement, so an association of operators was formed at Detroit on the 22d day of June, 1897, at a convention called for that purpose. "The Independent Telephone Association of the United States of America" was adopted as its name. Its work has been quietly but effectively done, and this organization has been heartily endorsed by all who have the good of the movement at heart. Small opposition has developed in some quarters among the independents who have had mistaken notions of its objects, but a careful study of the constitution and a little insight into its management have always satisfied the independent investors of the good work already accomplished and the great work of the future.

Of course the idea of organization among the independents has not been encouraged by the opposition, and much has been said and done to retard its growth, but it has continued to grow and will grow when it becomes known by all that the work of this organization has given a new impetus to independent telephony and has encouraged capital to invest in this movement.

The policy of this organization has not been to announce its movements from the housetops, and to publish long columns of figures in the newspapers and journals, but to work quietly for the promotion of all the independent telephone interests and to keep itself free from selfish influences. This policy is bound to win; it has always won in every public enterprise.

We come now to the prospects of 1898. This is a part of the subject that would admit of the flight of imagination and even of poetry, but as someone may read this prophecy late in the year 1898, it is best to indulge only in thoughts guaranteed by what we are able to see in the present, which has been in turn the result of the past.

The independent telephone movement will no doubt find even greater opposition in the year 1898 than it has had in the year 1897, but on account of its increased strength will be able to overcome opposition more easily and will develop much faster. The work will be taken up with more vigor in the larger cities, and long-distance telephony will be attractive to capital.

The term, "A few mushroom companies out in the West," will not be applied to this movement at the close of the year 1898, and the old phrase "natural monopoly" will no longer have a meaning in the telephone vocabulary. St. Louis will then have demonsrated that a 10,000-drop switchboard can be operated to its full capacity by an independent company, and Chicago and New York will have granted franchises for independent exchanges.

The year 1898 will bring to the independent movement more capital than the three preceding years have brought.

Rapid communication, not only by telephone but by telegraph, will be stimulated, and all companies will feel more and more the growing demand for more rapid service. We are just at the dawn of the day when quick communication at reasonable prices is demanded, and the year 1898 will show the people the great value of such service.

Great quantities of material will be in demand on account of the independent telephone movement in 1898. Its movement will be felt in every artery of trade, and every class of men, from the woodsmen who cut the poles in the forest to the skilled workmen employed in the factory, will reap the benefits of the demand on account of this movement.

Better equipment will replace the inferior, and the best construction possible to build will be the order of the independent movement in 1898. This will also be true of the opposition.

One advantage the independents have, and that is that they will not have to tear down property to build new, but [illegible] be able to start with proper construction and equipment.

Will the year 1898 [illegible] the end of patent litigation in the art of telephony? Man knoweth not; so far as this movement [illegible] concerned it matters little. Men of wealth and influence all over the country have concluded that the time has come when the microphone [illegible] dedicated to the use of the public under our law[illegible], and their movements can only be stopped by decrees of courts. The great masses of the people think [illegible] right.

In view of the great demand for telephone service, it is bad policy for the opposition to try to kill this independent telephone movement by trying to enforce imag[illegible] rights [illegible] in the mind of a few technical men by [illegible] the defective patent law governing [illegible] of patents.

The Denison and Choctaw Telephone company [illegible] extended its line from [illegible] to San Bois in the Choctaw nation. Other [illegible] are contemplated, and in a short time the company expects [illegible] the system in operation all over the Choctaw nation.

Long-distance Power Transmission.

By J. B. Wallace.

Probably no branch of electrical industry has made greater progress in the last few years than power transmission, for the reason that cheap and convenient power is one of the requirements of most successful industrial enterprises. By utilizing electrical power transmission large power units have been substituted for numerous small ones, large amounts of manual labor and fuel have been saved, and transmission losses have been largely reduced, thereby cheapening the cost of power.

The convenience and availability of electrical power as compared with other forms of energy have been practically demonstrated in various lines. In some cases it is particularly noticeable, as, for instance, in certain phases of the transportation problem. The whole field of electrical power transmission has been broadening, and its commercial advantages are being better understood and appreciated with each practical demonstration.

The latest development in this field to attract general attention, and probably one of the most ultimate importance, is that of long-distance power transmission, and under this head all electrical power transmission may properly be classed where the electricity is generated at a distance from and transmitted to a center of distribution at a higher voltage than that used in its distribution, this being essential from a commercial point of view if the distance is actually long and the distribution general.

The development of alternating current apparatus and step-up and step-down transformers, admitting of the use of high voltages in the transmission line, has made the transmission of large volumes of energy a considerable distance with a comparatively small loss and cost a possibility; the development of multiphase apparatus has further reduced the cost and greatly increased the flexibility of the distribution, while the appearance of the inductor type of alternating current generator has still further simplified the problem by making it practical to build the generator itself for the high voltages desired for transmission, thus doing away with the step-up transformers and securing a closer regulation and higher efficiency than is obtained from the old-style of machine.

The utilization of a small part of the immense power of Niagara Falls aroused a great interest in the subject of utilizing water powers and transmitting their energy by means of electricity considerable distances to an established demand for the power. Prior to the introduction of electrical power transmission it was necessary, in order for industries desiring to utilize the water power developed, to locate directly upon it, but multiphase apparatus and high voltages have changed all this, and to-day wherever water power can be developed within, say, 50 miles of an established demand for it at a reasonable cost, it is practicable and commercial to transmit the energy to the demand by means of electricity, and once the necessary investment is made for so doing the cost of operating and maintaining a hydraulic and electrical equipment is only a small percentage of that required to operate and maintain a steam power plant.

The cost of the hydraulic development and the value of power at the point of distribution practically settle the question of whether the investment will pay, irrespective of the distance. The actual distance has very little practical effect upon the cost of the electrical equipment, aside from the cost of the line, and consequently the cost of the line and value of power at the end of the line decide what is the most economical loss to figure upon, and whether it is advisable to increase the investment in copper to reduce the loss, or vice versa. The handling of the high voltages necessary for economical power transmission over long distances and the insulation of line and transformers is no longer looked upon as an engineering difficulty to be overcome, but a practical and commercial success. By the use of porcelain insulators the bare copper transmission lines are better insulated than the average distributing lines where the so-called weather-proof insulation and glass insulators are used, and it has been demonstrated over and over again that high potential transmission lines can be carried through comparatively populous districts with no greater danger to life or property than is incurred by the distributing lines in towns and cities at a lower voltage. In a large number of the states from Maine to California, where natural water powers are located, important developments have already been made, and their energy is being transmitted by means of electricity. These plants run in size all the way from 100 horse power to an ultimate capacity of over 20,000 horse power in some cases, and many of them have already demonstrated by their operation that long-distance power transmission is not only practical but exceedingly profitable, offering in many cases very large returns upon the investment required.

The conditions of hydraulic development for power transmission and distribution vary very largely. As a general rule in the eastern states water power is developed by means of large quantity and comparatively small head, while in the mountain states the reverse is true; the volume of water, [illegible] a rule, is comparatively small, while very high heads are obtained. In the former case turbine wheels are usually used; in the latter wheels of the Pelton type; and various methods are used for their application and regulation. In fact, this branch of the business has opened up a large field for electrical and hydraulic engineering.

The use of long-distance power transmission, however, is by no means confined to the transmission of water power to a distance; but, on the contrary, as it is cheaper in many cases to transmit power by electricity than to transport fuel, particularly where fuel has to be rehandled or hauled by teams, this is also opening up a very large and important field, and it is a point that should be considered in the location of every new power station.

It must be borne in mind that it takes no more copper to carry 1,000 horse power at 10,000 volts 10 miles with a given loss than it does to carry 1,000 horse power at 1,000 volts about one-tenth of a mile with the same loss. A practical illustration of the difference between using high and low voltages is that of a consumer of light and power who is now supplied over a transmission circuit of 18 miles at 10,000 volts and a distributing circuit of one-half mile at 2,000 volts with less loss in the transmission than when he was previously supplied by a 220-volt circuit only a few blocks distant, so that while over 18 miles farther from his source of supply he is electrically nearer to it. Therefore if a central-station plant for a city can be built outside of a city, where land is cheaper, so that the cost of the installation and the transmission to the point of distribution, with a loss at full load of five per cent., could be put in for the same money as a plant at the center of distribution, and a saving in the cost of fuel at the outside location would mean the saving in the cost of generating the current of 10 per cent., a continual saving in the operation of the plant could be made of more than five per cent. On the Atlantic coast there are numerous large manufacturing companies using large amounts of power that could undoubtedly effect a considerable saving by placing their power stations at tidewater and transmitting their energy from thence to their factories, rather than to rehandle and transport their coal. In some mountain districts where the demand for power is at an elevation of several thousand feet higher than adjacent deposits of coal, it would undoubtedly be cheaper to generate the power at the coal mines and transmit it to the demand by means of electricity than it would be to haul the coal to the same point.

Long-distance electric railroad work is also opening up a large field for long-distance power transmission, as quite a saving can be made by consolidating the power stations into large units, generating the current at high potential by multiphase alternating current apparatus, and transmitting it to rotary transformer stations feeding into the line.

The distribution of electrical power transmitted long distances at high voltages can be made through and by means of any of the existing distributing circuits, synchronous and induction alternating current motors, rotary transformers, synchronous motors driving constant or varying potential direct current machines, and alternating current arc lamps, enabling the most general distribution to be made and in connection with all existing installations.

To sum up, the advantages of transmitting water power by means of electricity and the transmitting of power in the place of transporting of fuel are so great in so many cases that it seems quite probable that in the course of the next 10 years as large an amount of electrical energy will be generated at a distance and transmitted electrically to a center of distribution as will be generated directly at the center of distribution, and probably most of the valuable water powers of the country will be utilized.

Electrical Construction and Inspection.

By W. H. Merrill, Jr.

In any review of the progress made in electrical engineering during the past year the importance of the universal adoption of the National Electrical Code as standard specifications, covering the safety of electrical wiring, should not be overlooked. That bodies of such recognized importance as the American Institute of Architects, the American Institute of Electrical Engineers, the American Society of Mechanical Engineers, the American Street Railway association, the Factory Mutual Fire Insurance companies, the National Association of Fire Engineers, the National Board of Fire Underwriters, the National Electric Light association and the Underwriters' National Electric association, besides all of the underwriters' organizations covering different sections of the country and nearly all of the municipal electrical departments of the United States, have agreed that this code is superior to anything heretofore drawn and suitable for adoption and enforcement as a uniform set of rules, is certainly worthy of note, and argues well for the future content of the engineer or construction company doing work in different sections of the country.

Uniformity of rulings by all inspection departments in all sections means much to all the interests involved, and as the year marks the greatest forward step yet made in this direction it is especially noteworthy.

The fire losses from electrical causes and the accidents and deaths resulting from electricity have exceeded last year's record to some extent, as would naturally be expected with the extension of electrical work constantly carried on. Electricity was and has been responsible for but a small pro-

portional part of the total fire waste, however. A rough estimate credits it with about one forty-fifth of the total annual fire loss, which amounts to approximately $140,000,000.

Throughout the year the marked advance in the stability of electrical construction work, as shown by the plants which have been installed or improved with an apparent view to permanency, is a most encouraging sign, showing, as it does, that investors no longer look upon electrical systems for distributing light and power as other than permanent structures.

Storage Battery Applications.

By Frank H. Clark.

The future of the storage-battery business would seem to be as promising as that of any of the electrical industries. This class of apparatus has long since passed the experimental stage, and though not so universally used as an auxiliary to central-station and isolated lighting plants in this country as in Europe, individual installations have been made here on a much larger scale than any on the other side. Within the next three months there will be installed in this city a battery as auxiliary to central-station lighting having greater capacity than any previous installation. At the same time an installation will be made in a neighboring city for railway station regulation which will have double the capacity of any hitherto made for a similar purpose. These installations will necessarily give an impetus to the storage-battery business.

New fields for the introduction of storage batteries on a large scale are constantly developing. An important instance of this is the rapid development of large water power plants for supplying electric energy to railway, lighting and power companies and to manufacturers of calcium carbide, carborundum and other articles requiring electricity in large quantities. At present these water power companies do not limit, strictly, the maximum amount of energy to be taken by the customer so long as the average taking does not exceed the amount contracted for. As the demand approaches the supply, however, regulations will doubtless be adopted, limiting the maximum to be taken to the contract amount. This will compel the user to provide a means for storing surplus energy when using less than the contract limit for use when the demand exceeds that limit. Nearly all street railways have a peak load of about an hour's duration, morning and evening, while all central lighting stations furnishing current by meter have an evening peak of generally less than two hours' duration. Should a railway or lighting and power company desire to contract with a water power company for electric current to meet the demands of its business, it would seem quite evident, therefore, that it could not afford to pay for the same on the basis of maximum requirement, and equally evident that the water power company could not afford to furnish the excess of current required for the peak load previously mentioned except at a rate which would be prohibitive. By the aid of a storage battery this business might be made mutually advantageous.

A similar opening for the storage battery is presented in the extension of central-station business by the installation of batteries on the premises of large users of current, to be charged from such stations at period of light load at a low price, current to be taken from the battery by the customer as needed. In this way the central station can secure a sale of its product at a time when the cost of production is almost negligible. No additional labor or station and distribution equipment being required, practically the only item of cost would be the coal. On the other hand, the consumer would be enabled to use the current at a time when if taken from the mains of the producing company the maximum charge would be made. One large eastern central-station company has already successively exploited this class of business.

The electric vehicle, which can be operated successfully only by the use of storage batteries, will probably create a larger future demand for batteries of moderate size than any other industry. While development in this, as in some other lines of storage-battery work, has not, perhaps, progressed as rapidly in this country as in Europe, electric cabs have been sucessfully operated in New York for many months and are found on the public stands for hire. In Chicago a few electric vehicles are also in use. A recently organized company with ample capital has in course of manufacture 100 electric cabs for public service in New York city. As it is but a step from the electric cab to the electric omnibus, may we not expect to see, and that soon, a change in urban transportation far more radical than that from horse car to "trolley"? The development of the ball bearing, the pneumatic tire and the asphalt pavement make this more than possible.

Without doubt more time, money and engineering ability have been expended upon the problem of battery traction than upon any other in the scope of the storage battery, and yet until recently but little success has been attained. Many if not most of the failures in this line have been largely due to the fact that reduction in weight, which means reduction in life, has been considered the first requisite. Experience has shown, however, that this feature is only secondary and of minor importance, while reliability and endurance are the chief requisites. Improved process of battery manufacture and handling have brought storage-battery traction within the circle of commercial success. To-day, in our own city of Chicago, a street-car line is successfully operated by storage batteries with a speed schedule in excess of a majority of "trolley" roads. This road has been in operation a year, and though it will require a longer time to determine just what the cost of battery maintenance will be, sufficient experience has been had to demonstrate that such maintenance will be less than one cent per car-mile. Compare this with the interest and depreciation on the increased cost of an underground trolley system, and it will be found that there is more than a possibility of profit in storage-battery traction.

As a regulator or governor of fluctuating electric loads, whether power or lighting, the storage battery is ideal. By no other device can the extraordinary and constantly occurring fluctuations which prevail in railway power stations be so quickly and accurately governed. By eliminating these fluctuations, the capacity of the station is greatly increased. At the same time the maximum efficiency of the generating plant is secured, with consequent increased economy. The same thing obtains where power is distributed to several units having variable loads, and particularly where it is desired to operate power and lighting circuits from one generator or a single bus-bar. It is claimed that a recent test made in New York developed the fact that, with a battery in parallel, starting a motor load of 1,200 amperes at 220 volts on the same bus-bar supplying current to 200 sixteen candle power lamps produced a variation in potential at the lamp of less than one per cent. It would thus appear reasonable to expect that as the advantages of the storage battery as a regulator become better understood, its use will become almost universal.

Recent developments in train lighting with the storage battery as an important adjunct warrant the belief that the electric light will at no distant day be universally used for illuminating day and sleeping coaches on all steam railroads. In the West to-day a "limited" train train which is not electrically illuminated is considered passé. One of the largest steam railway companies in the country is equipping 50 of its day coaches with dynamos and storage batteries of a system which has been successfully tested on the Pensylvania railroad for months.

It being impossible to charge storage batteries with an alternating current, it was thought that the rapid extension of the alternating systems might limit the scope of the battery. This probably would have been the case but for the development of the rotary converter. By the use of this ingenious machine current can be stored from an alternating system to be distributed at will as direct current, or it can be used to furnish direct current to the "rotary," to be turned into alternating current at any required potential or phase. This is actually being done to-day by two large companies using direct and alternating systems. A power plant using alternating-current generators and motors could, by the aid of a "rotary" and battery, store surplus energy and turn it back into alternating current for operating the motor load or lights at time of peak.

In addition to the above, the growing demand for storage batteries for isolated lighting plants, electric launches, telephones and telegraphs, fire-alarm and police-signal work, and in the smaller lines, such as automatic musical instruments, phonographs and dental and surgical work, will create a business which, though initially small, in the aggregate will assume very large proportions.

The Telegraph in 1897.

There is no repository of the yearly statistics of all the telegraphs of the United States, but a very good comparative idea may be obtained from the annual reports of the president of the Western Union Telegraph company to the stockholders. Probably three-quarters of the commercial telegraphy of the United States is transacted by, or over the wires of, this company, so that its reports may be fairly taken to represent the general condition of telegraphic communication in the country. President Eckert's latest report was made on October 13, 1897, and it shows that at that time the company had 190,614 miles of poles and cables, 841,002 miles of wire and 21,769 offices. During the year then reported it transmitted 58,151,684 messages, receiving therefor $22,638,859.16, at a profit of $5,73?,203.13. The average toll for each message was 30½ cents, and the profit on each message was a trifle over six cents. During the year 606 miles of pole lines, 14,073 miles of wire and 44 offices were added to the system. The number of messages transmitted shows a decrease of 608,760 from the number transmitted last year. "This decrease," says General Eckert, "was in a great measure due to the continued depression of general business throughout the country during the fiscal year to which the figures refer, although part of it is to be attributed to the business transmitted over leased wires, the returns from which are not accounted for on a message basis."

The total revenues for the year show an increase of $26,122.88 as compared with the previous year. The expenses for the year show an increase of $101,899.03 as compared with the previous year. The outlay for operating and maintaining the lines and offices, and for the equipment of new wires and offices, was practically the same as for the year before. The increase in the total expenses was due to the settlement of long-standing disputed tax accounts with several states, which were finally adjudged by the Supreme Court of the United States. The cost of construction of new property for the year was $449,747.07.

In conclusion the president says: "The condition of the company's property is being continually improved by the use of the best material and most modern appliances in all construction and reconstruction. The company has shared in the revival of business since the close of the fiscal year. Our test office weekly statements continue to show a substantial increase in our receipts. If the same percentage of increase is kept up throughout the current year, as the present commercial conditions indicate that it is reasonable to expect that it will be, the next annual statement will show a larger balance after the payment of interest and dividend charges."

Compared with preceding years, it may be noted that the exent of pole lines, miles of wire and number of offices are now at the highest mark in the history of the company. The number of messages transmitted in 1897 was, however, the smallest since 1890, the banner year being 1893, with 66,591,858. In revenue the years '91, '92 and '93 show up better, the last of the three being the greatest. In expenses 1893 alone shows a greater total than 1897. As to profits reported, the sum is the smallest recorded since 1889 and was also exceeded in the years 1880 to 1884, inclusive. Generally speaking, the average tolls per message show a steady and gradual decrease from the $1.047 of 1867 to the 30½ cents of 30 years later. A decline is also shown in the average cost to the company for each message, although the present figure, 24.3 cents, was exceeded very slightly as far back as 1878, when the average tolls were 38.9 cents and the average cost 25 cents, showing the neat profit of over 55 per cent.

BUSINESS OUTLOOK.

In reply to a number of inquiries addressed to representative electrical manufacturers and dealers by the Western Electrician, asking for a business review of the year just closed, with the prospects for the new year, the appended statements were received. In general, the prospect, as will be seen, is a very satisfactory one.

Lakon Company, Elkhart, Ind.: Business is good and the prospects are very bright for the coming year.

Diamond Electric Company, Chicago: Our trade is better this fall than ever before, and the prospects for the coming season are good.

W. F. Warner, Muncie, Ind.: I regard last year as having been an exceedingly prosperous one for the telephone public. However, I am expecting 1898 to be the banner year.

Hobart Electric Manufacturing Company, Troy, Ohio: We have had all we could do during the year, have plenty of orders at present, and do not know anything about what the future will bring forth.

Ohio Electric Works, Cleveland: We are not qualified to speak of "prospects." All our business comes from advertising and hard work. We have a tonic that makes "prospects," but it's only ink deep.

Vindex Electric Company, Chicago: We shall be well satisfied if our business for 1898 shall equal that of the year just closing. Judging from the increased inquiries and orders received during the last six months we predict a continued improvement in business for the coming year.

New York and Ohio Company, Warren, Ohio: We have had a prosperous year and believe the prospects for the year 1898 are very bright. Some of the purchasing agents are commencing to realize that there is a difference in quality, and that the lamp selling at the lowest price is not always the cheapest for them to buy.

Inter-Mountain Electric Company, Salt Lake City, Utah: The business of the past year has been a great improvement over that of the several preceding years, and the outlook is favorable for a continuance of this encouraging condition during the year to come, although there is nothing at present of any magnitude in our line.

Warren Electric and Specialty Company, Warren, Ohio: The outlook for the coming season to us seems very bright, judging by the past season. This success we attribute to our having made a good lamp and to the fact that we let the public know of it, and that we have so thoroughly exposed the disreputable methods of the trust.

Burnley Battery and Manufacturing Company, Painesville, O.: Business has been very gratifying, not only in the battery line, but with the Burnley soldering paste. Taking as an index the increasing business of the last two months, we have reason to believe that the advent of the new year will bring to us increased prosperity.

Standard Underground Cable Company, Pittsburg: We take pleasure in saying that the past year has been a prosperous one with us. Prices have been very low, but with a large volume of business and careful economy in manufacture the results have been most gratifying. We believe that better prices and [illegible] business will be the rule next year.

Fort Wayne Electric Corporation, Ft. Wayne, Ind.: There never was a brighter [illegible] before the electrical industries generally than [illegible] year. Money seems to be plenty and at very low [illegible]ures, practically speaking. As to the business outlook, we cannot say what others are doing, but [illegible] from our own work. We are operating to-day [illegible] two hours out of the twenty-four, with a full double shift of the force. Our arc business has been, [illegible] fore, exceedingly good. Our alternating work [illegible] exceeds our fondest hopes. As to the direct-current work, we are unable to take care of the orders then come to us. While we have doubled our meter and [illegible] departments three times the past year, we should to-day

double them again. The great amount of work in prospect has compelled us to contract for a factory in addition to our present factory, 266 by 68 feet, with a gallery, and a laboratory in addition to our present laboratory, 150 by 38 feet. We trust the incoming year finds the future as bright for all other electrical concerns as it is for the Fort Wayne Electric corporation.

Globe Carbon Company, Ravenna, Ohio: Our business has shown a steady increase since June 1st, last, and from the present indications we feel assured that prosperity in our particular line, at least, has returned and will remain with us. Because of the steady increase in our business we have had to add new machinery and additional help, and we are still considerably behind in orders.

Storey Motor and Tool Company, Philadelphia. We consider the business outlook for the coming year as being vastly better than it has been at any time during the past three or four years, and we think the return of confidence is being generally felt in almost all industries at the present time. Also that the prospects are it will be even more decided during the coming year.

Bullock Electric Company, New York: Our prospects were never brighter. During the year our own business has more than doubled that of the previous year, and we now have so many orders on hand for delivery next year that we have decided to build a new factory in order that we may handle the increase of trade. Judging from our experience, we believe that the entire electrical industry will make more rapid strides than ever before.

Albert & J. M. Anderson Manufacturing Company, Boston: We are never inclined to be sanguine; but we think that there will be good business for the manufacturers who have goods to place on the market which have proved to be reliable. We have made a larger number of heavy switches and switchboards the past year than ever before, and expect to gain in this line for the coming year, having improved facilities and a wider experience.

Kokomo Telephone and Electric Manufacturing Company, Kokomo, Ind.: We have had a very prosperous year and have also received orders ahead that will carry us well into the new year. For the last three months we have been running continually behind our orders, and, finding the present quarters too small for fast increasing business, we are now building a new factory that will increase our capacity to meet the requirements of the trade.

Fuller & Curtis, Detroit: So far as we are concerned business is very good, we thank you. We have more work than we have had for some time, and it keeps increasing. We are making good fans and motors, selling them cheap and delivering them promptly, and why should not business be good? We have orders on our books which will keep us busy till next June, but we have plenty of room for more and will be glad to hear from everybody that wants anything in our line.

Emerson Electric Manufacturing Company, St. Louis: Inasmuch as our business for the last year has, in a general way, shown a heavy increase, and the line of inquiry seems to have widened out, it strikes us that the prospects are still growing better and better, and that there is nothing in the way of good times from now on. To this idea, based largely on our own affairs, we have the added weight of our acquaintance in similar lines, all tending to show the same general opinion.

Peru Electric Manufacturing Company, Peru, Ind.. The outlook for our business was never better than now. With our new line of electrical specialties, we are enabled to interest the supply men all over the country. Our factory has been run to its utmost capacity for some weeks past, and we are to-day breaking ground for a new building and greater kiln capacity. We are expecting a largely increased business during the ensuing year, and are putting ourselves in position to handle it.

Stromberg-Carlson Telephone Manufacturing Company, Chicago: This company has experienced a steady growth during the year. The constantly increasing business, which forced it to move from Clinton street to the present location at the beginning of the year, has recently compelled it to greatly add to its space. For the starting of the new year the company has a large number of orders for reëquipping exchanges, besides the furnishing of complete exchange equipments through the southern states.

Kester Electric Company, Terre Haute, Ind.: Business of the year was very satisfactory, and except for the extremely low prices prevailing the volume would have been greater than in 1896. The small margin of profits on sales have prevented the granting of long time credits, and in consequence collections have been easy. The last 60 days have shown a marked increase in both orders and number of inquiries received, and we think the business outlook for 1898 is as bright as any time within the last five years.

Partridge Carbon Company, Sandusky, Ohio: It has been a busy year with us. Our output has been about one-third more than in any previous year. The new year finds us entering into a new field. After experimenting for over two years, we have at last succeeded in producing an electric light carbon equal to any imported [illegible]. We are now putting in place special machinery for [illegible] manufacture of these goods. The outlook for '98 [illegible] very promising in all branches of the electrical trade [illegible] which we are interested.

Leschen-Macomber Whyte Company, Chicago. Our business in the electrical line for 1897 has been more than [illegible] before, and almost double that for the year 1896. We are receiving numerous inquiries daily for electrical material, particularly in telephone and electric light construction, and we believe that the coming year will be one to be remembered in this line of business. We beg to call your attention, as well as that of the trade, to the fact that we have issued a very fine calendar for 1898 which will be mailed upon application.

Crown Woven Wire Brush Company, Salem, Mass.: We have had [illegible] trade the last few months. We sold 25 per cent more [illegible] during the month of November than [illegible] other month since we have been in business. [illegible] started well and the outlook for a good [illegible] favorable. Woven wire [illegible] and more popular every day. [illegible] are coming from the West. We feel that [illegible] growing better slowly but surely, and that [illegible] will boom in 1898.

Roth Bros. & Co., Chicago: Our principal business is the manufacture of [illegible] for isolated lighting and power plants, and [illegible] at which [illegible] manufacturer of other product [illegible], our business takes on immediately. While the year 1897 in aggregate was a fairly good year for us, we much [illegible] that we never enjoyed a steady run of orders, but [illegible] seemed to come in jerks. For two or three [illegible] business would fairly boom, while the following [illegible] or two might be called a dead letter as far as business was concerned. However, we could feel that toward the end of the year orders became more regular and were placed with considerably more confidence. October, and especially November and December, have shown up exceedingly well. In fact, business has taken on to such an extent the latter part of the year that we were forced to add more machinery to our plant and employ extra help to keep up with orders. This leads us to believe that the year 1898 will prove a promising year in our line, and one of the best we have experienced for some time.

K. & W. Company, Pittsfield, Mass.: We have had a successful and satisfactory year, and during the year have increased our capital stock for the purpose of going into the incandescent lamp business. Salem M. Hardy, who is an old and experienced incandescent lamp manufacturer, has entered the company, and we have equipped the factory with all modern improvements for manufacturing a high-grade incandescent lamp. We are now running a full force in all departments and are having a most satisfactory trade in lamps, with a large number of orders on hand.

Electric Arc Light Company, New York: This company has enjoyed the most successful year in its history. The Pioneer enclosed arc lamp has been adopted by many of the largest mercantile houses and lighting plants in the country, and has also been introduced in many foreign lands. During the year we have improved the lamp in many details and have doubled the manufacturing facilities, and are now able to produce a thousand lamps per month. Many orders are already booked for delivery after New Years, and the prospects for the future are very bright for the Pioneer lamp.

Farr Telephone and Construction Supply Company, Chicago: The year has been the most successful in the history of our company. We have been favored with orders from every state in the Union, and besides have done business with customers in many foreign countries who have heard of our products. During the coming year expect to do even a larger business than in the past. We consider the business outlook exceptionally bright. We are removing to the ground floor of the fourteen-story building at 357 Dearborn street, where we will have more room and more elegant quarters.

Cutter Electrical and Manufacturing Company, Philadelphia: The outlook for the coming year could hardly be better. Light, heat and power companies are being established all over the country, and are only exceeded in number by the trolley lines, which will open up new fields and increase business in old ones. Traction, too, abroad is just beginning to make itself felt, and we Americans will get our share of the required equipments; and power transmission—but we are too busy to enumerate. We look for good business all along the line.

Swarts Metal Refining Company, Chicago: We found the electrical trade considerably improved last year; in fact, we note a marked improvement over the previous year, both in our sales of supplies and purchases of scrap material. The increase in the accumulation of scrap material by the electrical plants is no doubt due to the fact that there has been considerable repairing and remodeling through the line. As for the prospects in the coming year, we see nothing to interfere with the improvement over the past year. We are looking for more business, and hope our expectations may be realized.

Nungesser Electric Battery Company, Cleveland, Ohio: Our business has steadily increased since last January, our October and November business of this year being more than double that for the same months of 1896. December sales are most satisfactory and the outlook very encouraging for the future. While collections have been a little backward in some quarters, the aggregate has been very fair. We are so confident that these improved conditions are permanent, we are preparing to double the capacity of our factory. Certainly, if our business is any criterion to judge from, prosperity with a big P has come to stay.

Central Manufacturing Company, Chattanooga, Tenn.: Business just at this time is rather off, as usual, but we have gotten ourselves in position to fill all orders promptly, and are expecting things to pick up shortly after the holidays. Still, we cannot complain, as we have done fairly well. Among the special orders filled this year we mention the power plant at Mechanicville, N. Y., the pins for the Lachine Rapids plant at Montreal, pins for the power plant at Butte, Mont., and for the Montana Power company. We also furnished the materials for the Niagara Falls and Buffalo power transmission line, and several others.

Missouri Telephone Manufacturing Company, St. Louis: The business of the year 1897 has more than met with our expectations. Since April last our business has almost tripled itself. We have been obliged even to increase our facilities to a great extent, and although prices are somewhat lower, we feel perfectly satisfied. From present appearances we should judge that the business for the year to come will be good. There seems to be a decided movement throughout the telephone field for the extension of lines and the building of exchanges, and unless all signs fail, business for 1898 will be even larger in volume than 1897.

Michigan Electric Company, Detroit: We have had a very satisfactory business during 1897, particularly so during the latter half of the year, the business of the first part having been a little below our average for previous years, while for the last part it has been much in excess of same, thus indicating plainly to us the general return of business confidence and action. Our business is now better than ever before and is extremely active in all departments, and we confidently look forward to the year 1898 as one in which we will share with the general business community in the large volume of business which we feel sure will be transacted.

Bossert Electric Construction Company, Utica, N. Y.: Our business has largely increased during the past year and is now eminently satisfactory. Our factory is running to its full capacity and we are frequently working overtime to fill our orders. With the renewed activity in business which seems general in its nature, and which has already made its influence felt in the building trades, and from the general interest which insurance men and others are taking in safer and better methods of electric light wiring, we cannot but feel pleased at the prospects for the sale of our steel boxes, which have met with general approval, and we expect a busy time in 1898.

Card Electric Company, Mansfield, O.: The year just closing has witnessed a substantial advance in recovery from the distressing conditions of 1895 and 1896 and a largely increased volume of general business, in which the electrical industries have secured and enjoyed their full share. The early months of the year were characterized by fluctuations in the demand for manufactured goods, owing to uncertainty in the minds of many of our people as to the actual return of prosperous times; but confidence has steadily grown, and in view of the results already attained, as shown in widely published statistical reports and the multiplied facts of minor or local importance which come under the observation of every observing man, there would seem to be no reason why any citizen of enterprise and business capacity should hesitate to commit himself and his business interests to "that tide which taken at its flood leads on to fortune." Not the least convincing of these indications is the evident intention in every quarter to take some forward step, early in the new year, in the direction of enlarged facilities for production, which is shown in the inquiries continually received looking forward to contracts in the early weeks of 1898. Barring war with foreign nations or other unforeseen and improbable contingencies, there is the strongest assurance of very large and reasonably profitable business in all lines of trade in 1898.

K. McLennan & Co., Chicago: The year with us was an epoch in itself. It marked the change of Gales's commutator compound from a specialty to a staple article; from an article used by a few plants to one of general use, until at the close of the year it is in regular use by nearly every power plant and central station in the United States and Canada, and to be found for sale in every supply house. In the past year we have established agencies in Sweden, Norway, England, France, Germany, Italy and Japan. By the aid of advertising in the Western Electrician the name of Gale is now known to every user of a dynamo or motor. Our expectation for the future is to gather in the few power plants which are not now using our compound.

Boiler Expurgator Company, Chicago: We have exceeded the probable trade looked for in 1897, both in Holm's Tesoline commutator compound and the expurgator. The protective tariff has given some industries an advance to the detriment of some others, which will from the first of this coming year to its close attract considerable capital. The general market in unprotected industries will show an advance over that of the year. The protected industries have naturally attracted the leading enterprise of the country, and this deprived other industries of their pro rata share of enterprise. The end of this year will probably show a more equitable scale for commodities in general, without which even protected articles must fail of their proper home markets.

Lindsley Brothers, Menominee, Mich.: The demand for poles during the last season has been in every way satisfactory to us. We have sold more telephone poles, 20, 25 and 30 foot lengths, than we have ever sold before in any one year. The demand for this class of poles has been unprecedented, showing that telephone construction work has been very active. We anticipate a more active demand for telephone and electric light poles for 1898 than in 1897. Everything indicates greater activity in this line so far this fall. We find the demand in the South increasing every year; more so than in the West. The only fault that we find with trade is that we cannot get better prices for our product, as all other industries in this line are receiving increased prices over last year.

Partrick & Carter Company, Philadelphia: The year now drawing to a close has been a satisfactory one to us. Collections have improved to a marked degree as compared with 1896. There has been a decided increase in the demand for supplies, the most gratifying feature of which is that buyers are showing more conservatism and using better judgment than was the rule during the years preceding the late business depression. These reasons alone are cause for congratulation. As to the future we are very hopeful, and believe that the rising of the sun of prosperity can be hastened and its brightness intensified by the dispersion of war clouds, a settlement of the currency question and the enactment of a national bankruptcy law which will be just to the creditor and debtor alike.

Ohio Electric Specialty Manufacturing Company, Troy, Ohio: We are highly elated over the business we have done during the last six months and look forward to the coming year with somewhat of eager expectancy. There has been a decided improvement in our different branches recently, owing to the starting up of plants which have experienced enforced idleness during the period of depression. We have been compelled to run extra hours right along, and our business has been so gratifying and so overtaxed our capacity that we have had to curtail our advertising and to hold back for the time being a number of new specialties which we intend to place on the market. Everything considered, we are of the opinion that the coming year will be one of renewed prosperity all along the line.

Wheeler Reflector Company, Boston: It is perfectly clear that we have stepped over the threshold of better times and may with confidence look for that gradual and general increase of business that must result from the continual development of new territory through enlarged agricultural, mining and manufacturing operations. This company has no reason to complain of not getting its share of business in the year just past. Its orders have come not alone from all parts of the United States, but from the whole world over, and it has no misgivings about receiving increasing demands for its goods in the future. This is inevitable, when pace is kept with demands incident to every improvement in the lighting field and when attention is invariably paid to maintenance of quality at lowest living prices consistent therewith.

Rawson Electric Company, Elyria, Ohio: Generally speaking, we believe all manufacturers are looking forward to '98 with cheerfulness. There are special reasons, however, why manufacturers of high-class telephone apparatus may feel especially hopeful. With the Bell "Berliner bugbear" removed from a legitimate business, ample capital is being attracted to the very promising fields of telephone extension. Add to the demand for public exchange purposes the constantly increasing call from progressive manufacturing and professional men, and there can be but one result, i. e., an extraordinary demand for electrical telephone apparatus; but the manufacturer who expects to secure and hold his share of this increased business must furnish good goods. Not "how cheap," but "how good and durable," will be the burden of the inquiries for 1898.

General Electric Company, Schenectady, N. Y.: The business of this company during 1897 has been of an extremely reassuring character in every branch—lighting, supplies, railway, motor and mill equipment, mining and power transmission. We consider that in view of the extremely slow convalescence of general business, we have received a larger share than might have been expected or was estimated at the beginning of the year. The facilities of our factories have been taxed to cope with the orders which have come pouring in, and we have found it necessary to extend the area of our factories and increase the general facilities to take care of the increased business now and in the future. To go into details would occupy too much space, but it may be said that every department of the General Electric company has shown a decided increase; in some, of course, more than in others. The sales of our electric lighting apparatus, as well as our railway apparatus, have been continuously good throughout the year, and while large installations have not been numerous, the call for supplies has been unprecedented. In the electric mining field the use of electricity to drive pumps, blowers, hoists, etc., and to run locomotives has also shown an encouraging growth. There are no less than 75 electric locomotives of our manufacture now in operation in the mines of this coun-

try, each an active missionary to mines still operated by other methods. Our long-distance transmission work has also assumed very large proportions; up to date over 100,000 horse power of exclusively power transmission apparatus of our manufacture has been installed or contracted for. Our foreign business extends to every quarter of the globe. Our apparatus is sold purely on its merits and finds a ready acceptance at the hands of the foreigner. With our long experience we are able to parallel almost any case in a foreign country with one in our own. The prospect for 1898 is encouraging, and in view of the large increase in our business, as foretold by existing signs, we are making the necessary preparations to cope with it.

Shelby Electric Company, Shelby, Ohio: The business outlook for the manufacture of incandescent lamps seems to be very bright. We have had a constantly increasing trade that has made it necessary for us to run nights ever since the latter part of August. There seems to be a gradual changing of the lighting systems, with a tendency toward higher voltages. The greatest evidence we have of it is the constantly growing demand for our 220-volt lamps. We are making a great specialty of lamps in high voltages, and anticipate that others will have to do the same some time in the near future. If the increase in the number of lighting plants continues as it has during the last few years, the capacity of every lamp factory in the United States will have to be doubled in a very short time. We feel that we are getting our share of the trade and have nothing to complain of.

Gordon-Burnham Battery Company, New York: The returns for October, November and December are in the neighborhood of 100 per cent. better than during the corresponding months of 1896. In the matter of collections we do not find any improvement. There seems to be a general disposition to increase stocks, which of course reflects in sales. The business of our company, however, can scarcely be considered as a criterion upon which to base judgment of the general business in the electrical field, inasmuch as the bulk of the goods manufactured by us are new to the public and it necessarily requires a great deal of missionary work in order to introduce them. As this work has been in progress in the neighborhood of two years, we would naturally feel the effects in an improved output. We look forward to the new year with optimistic feelings and are convinced that 1898 will show a business as compared with 1897 from three to four fold.

Central Telephone and Electric Company, St. Louis: The demand for goods in our line has been very satisfactory in the past year, and collections likewise; but as the demand has been constantly increasing, we look forward to the next year as being the best that has ever been in this line of the electrical industry. When telephones were first offered at an outright sale the principal purchasers were large companies, composed of bankers and capitalists; then the merchants became interested, and now a large demand for our goods is from farmers. As an instance of the diversified classes of people in the telephone line, we may mention that we have one firm as a customer which is composed of an Indian and white man and has employed a negro to take carge of the exchange. Thus you can see the field in our line is widening until we can say the world is our territory, and under these circumstances the manufacturer offering the best inducements is assured of plenty of business for the year 1898.

Elwell-Parker Electric Company of America, Cleveland, Ohio: The last year has been one of expectation and hope not altogether deferred, and, as regards the last few weeks, there has been a distinct improvement. Of course, in a manufacturing business like ours, a return to good times is not felt as soon as it is in some other directions. The improvement already apparent in the "general primary industries" has already begun to affect the electrical line and appears to us to amply justify expectation of a sound and very considerable improvement in our line of business, as well as in general business, for the coming year. There is one feature in the present conditions that is not altogether satisfactory. It is the prices, that are the result of what we may term a frantic competition. This feature, however, we expect to see improved by a considerable increase in the volume of electrical business done, and, concurrently, improvement in methods and means of production and marketing of products.

W. C. Sterling & Son, Monroe, Mich.: Our cedar pole business for the past year has been the best in years. We have sold poles, cross-arms and pins to electric light, street railway and more independent telephone companies than ever before, shipping as far west as Colorado, south to Texas, and east to New York, and north through Canada. The independent telephone movement is gaining ground and greatly helps our business, although competition is strong. We have recently opened three yards in new territory and are prepared to handle a large number of poles the coming year. We are members of the board of directors of the large New State Telephone company and of the Detroit Switchboard and Telephone Construction company, which has built the largest independent telephone exchange in the world, and we are in deep sympathy with the movement and are furthering such interests whenever possible. We wish to see a combination of all the independent telephone companies so as to connect all cities with toll lines, as the Bell company now does, and our company is moving in that direction throughout this state.

Electrical Exchange, Chicago: The last year has been somewhat more satisfactory than the previous year, and the general feeling has been encouraging all through the year. The increase in the volume of business during the last few months has been especially remarkable. Many of the contracts which electric lighting companies held, or now hold, have expired or are about to expire, thus creating a demand for additional apparatus. The street railway trade in our line was very satisfactory during the summer, but at this season of the year but few street railway companies are making any improvements, although we predict a good trade in this branch of our business during the coming spring and summer. Many of the roads are contemplating extensions and improvements, and a great many lines will be constructed during the coming year. In fact, there seems to be no limit to the increase in mileage of street railways all over the country. We believe that the prospect in store for the coming year is as bright or brighter than for some time past. We expect to do fully twice as much business in the coming twelve months as we have done in those just passed.

Brush Electric Company, Schenectady, N. Y.: The business for the past year with us has been infinitely better in all respects than in the two years previous. We have sold more apparatus and have received promptly our pay therefor. Isolated electric light plants and local companies are being enlarged throughout the country. We hardly know of an electric light company that has not some plan, definitely or indefinitely formed, for rebuilding its station and increasing the amount of its apparatus and putting its properties in better condition. The above, of course, means a large amount of business for us and for others. Capital, however, is much more timid than it was in 1892, but if the "powers that be" in Washington give the country a rest and do not agitate capital by tariff, financial and other useless legislation, capital will get over its scare, and a large amount of it will be invested in electrical industries of every kind and description. We have great confidence in the administration, believe that it understands thoroughly what is best for the interests of the country, and that great wisdom will be displayed in giving us a conservative government. If this be done, then nothing in the past will be equal to the development of the electrical business during the next two or three years.

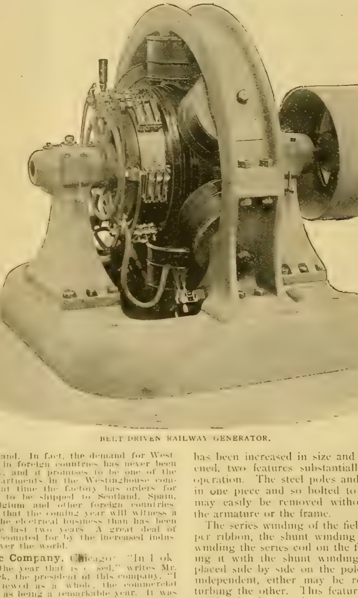
Westinghouse Electric and Manufacturing Company, Pittsburg: While the electrical business of the past two years has not been particularly flourishing with the companies in general, this company has obtained some of the most important contracts for electrical apparatus that were ever made. Among these the contract from the St. Lawrence Construction company is of special interest, not only for its size, but also owing to the interesting features of the work for which the apparatus is to be used. The contract calls for fifteen 5,000 horse power generators, to be installed near Massena, on the St. Lawrence River in the northern part of New York, where the St. Lawrence Construction company is about to utilize the falls of the St. Lawrence River in driving these machines and transmitting electric power to the surrounding districts to be used for manufacturing purposes. Another important contract is an additional order from the Cataract Construction company for five more 5,000 horse power generators for the Niagara Falls power plant, of the same pattern as the three now in operation, which were installed by the Westinghouse company during the last two or three years. The contract for the electrical and mechanical equipment for the Boston new terminal station was another important order, and certain features connected with it make it specially interesting. This feature lies in the fact that the entire work was intrusted to the allied Westinghouse interests, for the reason that they are the only concerns in this country in a position to take charge of such work and complete it without the subletting of any contracts to other firms. The Westinghouse company also obtained a very large contract for mechanical equipment and electric lighting machinery in London, England. In fact, the demand for Westinghouse machinery in foreign countries has never been so great as recently, and it promises to be one of the most important departments in the Westinghouse company. At the present time the factory has orders for apparatus which is to be shipped to Scotland, Spain, Siam, Havana, Belgium and other foreign countries. This would indicate that the coming year will witness a greater activity in the electrical business than has been observed during the last two years. A great deal of this, no doubt, is accounted for by the increased industrial prospects all over the world.

Central Electric Company, Chicago: "In looking backward over the year that is closed," writes Mr. George A. McKinlock, the president of this company, "I think, when it is viewed as a whole, the commercial world will regard it as being a remarkable year. It was in some respects a crucial year, as it started out after a long and disastrous period of depression with exaggerated, although natural, promises of prosperity. There had been developed in the minds of all classes the idea that all that was necessary to do was practically to push the button and the wheels of industry would hum rapidly and sweetly, regardless of the fact that the machine was so weakened by its long period of inactivity that it was not in a condition to admit of its being operated at its maximum capacity. The experience during the year was profitable, and now the country is somewhat in the position of a giant refreshed with new wine. The causes contributing to this happy condition are about us. We have an administration that enjoys the confidence of the business world, we have in our esteemed townsman, the secretary of the treasury, one who is able, wise and competent to deal with the problems which require solution. We have had a bountiful harvest, with surplus food products sufficient to supply the requirements of other less favored countries, which has enabled the western agriculturalist to pay off his mortgages by the ton; also a trade balance in our favor constantly on the increase, and a tariff which will soon supply us with revenue sufficient to meet the expenses of government and protect our gold reserve until such time as the currency problem is solved, when the bugaboo of the gold reserve will cease to plague us. The development of our iron and steel industries has surprised ourselves as well as wrought consternation in the ranks of foreign manufacturers. In our own particular field of electrical development and manufacture, speaking generally, our trade is broadening and we are beginning to be felt in foreign markets. The large foreign contracts that have been placed with our electrical manufacturers have had a beneficial effect in helping us to appreciate our resources as manufacturers. In the electrical supply trade, the whole tendency, in my judgment, is encouraging, and the outlook promising for not only a larger business but a more profitable business. Jobbers in electrical supplies have about concluded that the electrical supply trade conditions are no different than other legitimate lines, and are awakening to the fact that the buyer in the past has had altogether the best of it, and that taking orders for glory is along the same path as other glory seekers traverse, and which, we are told, leads to the (commercial) grave. This lesson, judging from all the signs of the times, seems to have been well learned, and if kept in mind, will result, I confidently believe, in 1898 being the most satisfactory year the trade will have experienced."

Belt-driven Railway Generator.

Many cases exist in which the conditions do not warrant the installation of direct-connected apparatus, and to these cases the belt-driven generator is more applicable. Improvements in these generators have kept pace with those in all other classes of electrical apparatus, and the distinguishing features of excellence of the General Electric company's direct-connected apparatus have been incorporated in its new line of belted machines. These are all six-pole generators, built in five sizes ranging from 110 kilowatts to 500 kilowatts. The illustration shows a 110 kilowatt, six-pole, 500 revolution machine.

The magnet frame is of cast-steel heavily ribbed, making it both light and compact. Its magnetic efficiency is the highest obtainable. The bearings are built upon the ball and socket principle; are self-aligning and self-oiling. The armature shaft



BELT DRIVEN RAILWAY GENERATOR.

has been increased in size and the bearings lengthened, two features substantially guaranteeing cool operation. The steel poles and pole-pieces are cast in one piece and so bolted to the frame that they may easily be removed without disturbing either the armature or the frame.

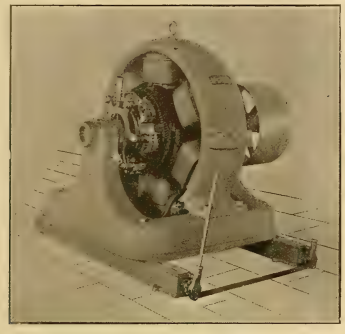
The series winding of the field coils is of flat copper ribbon, the shunt winding of wire. Instead of winding the series coil on the field spool and covering it with the shunt winding, both windings are placed side by side on the pole, and being entirely independent, either may be removed without disturbing the other. This feature will be greatly appreciated when it is compared with the methods heretofore in use. It is no longer necessary with this new method to remove the shunt winding to reach the series winding.

The armature is of the barrel-wound type, such as is used on the General Electric direct-connected generators. This method of winding gives the smallest number of joints, and facilitates any necessary repairs, as few coils need to be removed to reach any particular one incapacitated for service. The cast iron flange, bolted to the armature spider at each end of the core, forms a support as well as a cylindrical receptacle for the projecting ends of the coils. The coils are secured firmly in the slots of the core, and the cross connections are made on the [illegible] flange. The projecting ends of the coils [illegible] flange are thoroughly insulated and held [illegible] by steel bands. The flange extension also [illegible] the windings from any oil that may be thrown [illegible] the bearings. The surface of the [illegible] armature is perfectly smooth, offering no [illegible] nity for the collection of oil or dust.

Ventilation is effected by the use of [illegible] structed vanes forming air ducts between [illegible] nae of the core. These convert the [illegible] into a blower, and create a strong draft through [illegible] windings. The commutator leads are [illegible] directly

from the coil to the segment immediately beneath it The construction of the commutator is similar to that of the direct-connected machines. It is ventilated by air drawn through the body and discharged through air ducts in the core. The small difference of potential between the segments secures the permanence of the insulation and freedom from sparking.

The strength of the magnetic field in these generators is so proportioned to the armature reaction that

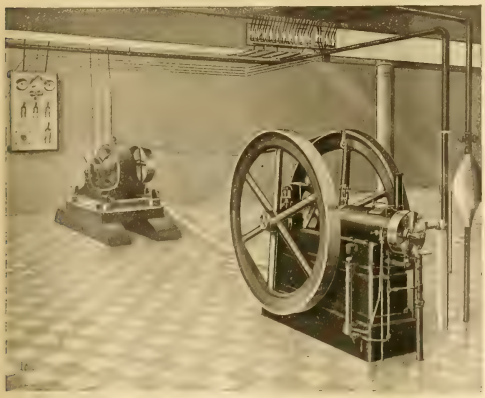


NEW AKRON MULTIPOLAR APPARATUS.

a constant brush lead and neutral point are insured even with heavy overloads.

Fairbanks-Morse Gas and Gasoline Engine.

The use of a gas or gasoline engine for electric lighting is a most satisfactory method of illuminating private residences, stores, clubs, hotels, etc. The chief advantages of this system are economy, simplicity and convenience. The Fairbanks-Morse engines have been thoroughly perfected, and a new type, called the "special electric engine," illustrated herewith, has been placed upon the market. This type is especially designed for furnishing power for electric light plants by either belting directly to



A FAIRBANKS-MORSE GAS AND GASOLINE ENGINE.

the dynamo or by direct coupling to the engine shaft to the armature shaft of the dynamo. These special electric [illegible] governing, being [illegible] in controlling the [illegible] respond to the work demanded. The cost of furnishing such [illegible] by Fairbanks, Morse & Co. to be about one-fifth what would be charged by an electric company for furnishing the same number of lights. Many of these plant have been installed and the [illegible] be giving most excellent satisfaction, both as to services rendered, economy of operation and convenience of the system. Plants are in operation that are furnishing from 50 to 500 incandescent lights, and reference to the letters in the circulars of the manufacturers will fully explain what satisfactory service they are performing.

As generally figured, when lights are furnished by an electric lighting company the average charge is one cent for one 16 candle power lamp for each hour, and when the Fairbanks-Morse gas or gasoline engine is used, with gas for fuel at 50 cents per 1,000 feet or gasoline at the average price, five 16 candle power lamps, the company states, can be furnished for one hour for one cent. When the gas fuel costs $1 per 1,000 feet the cost per lamp for one hour would be in direct proportion to the increased cost in fuel over the 50 cents per 1,000 basis.

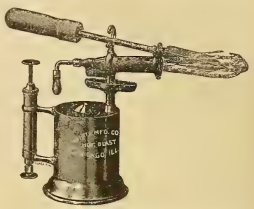
Fairbanks, Morse & Co. invite those interested to visit their warerooms in Chicago, corner of Monroe and Franklin streets, and inspect the electric lighting plant which is operated by a 15 horse power special electric gas engine.

Combination Hot Blast Blow Torch.

The accompanying cut illustrates a new torch now being placed on the market by the White Manufacturing company of Chicago. It is called by the maker a combination hot blast blow torch, and is a new and powerful generator for heating by gasoline. It is in reality three useful tools in one, combining a soldering iron heater, a painter's and electrician's torch, and a paint burner. The soldering iron attachment is the most valuable feature of this torch, as it makes it thoroughly adapted for electricians, as well as useful in outside work, such as conduit building, joint wiping, etc. This torch gives a perfect blue flame estimated at 1,500 degrees Fahrenheit.

New Akron Multipolar Apparatus.

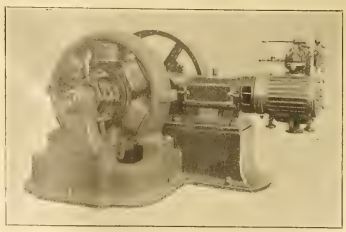
Many special features are incorporated in the new Akron multipolar apparatus manufactured by the Akron Electrical Manufacturing company of Akron, O., which is herewith illustrated. The dynamo has a cast-iron field yoke with laminated steel magnet cores and soft steel pole shoes, thereby giving ideal magnetic and structural conditions. The lami-



COMBINATION HOT BLAST BLOW TORCH.

nated cores, having a great capacity for magnetism, respond readily to the magnetizing influences of the coils encircling them, while the cast-iron makes a perfect welded joint between the cores and yoke, and the yoke has a sufficient cross-section to add beauty to the design as well as rigidity to the whole frame, at the same time using only metal enough to provide for the magnetic circuit required. The soft steel pole-shoes distribute the magnetic lines evenly over the armature, while the cross-section of the magnet cores is reduced as much as is compatible with efficient results, thereby reducing the copper losses in the field as much as possible. The armature is built up of fine laminations of soft steel divided into three or more sections by small brass spacers having radial arms to create a blast of air through the core openings thus formed and across

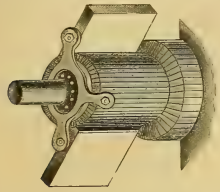
NEW AKRON MULTIPOLAR APPARATUS.



NEW AKRON MULTIPOLAR APPARATUS.

the armature winding. The spider which carries this core is of cast iron with radial arms so arranged as to exhaust air freely through the ends and force it outward through the passages formed by the spacers and the end flanges, which have also radial passages for the air. This construction so ventilates the armature as to increase the radiating capacity enormously and keep the temperature down far below the normal practice, thus allowing of heavy and continued overloads without injury to the dynamo. The machine formed coils of the armature are first perfectly formed, then insulated by hand and imbedded in troughs made of mica, paper and pres-

board in the armature slots. The commutator is made up of drop forged copper bars, with the best India mica insulations, and put together at high temperatures and under enormous pressure, so that it is impossible to move the bars when once they are assembled and turned true. The current is taken off by radial-feed carbon brushes, with large bearing surfaces on the commutator, which contributes to make them run almost noiselessly and cool. They are connected at the top by means of flexible copper strips to the brush-holder's body, thus making a positive metallic circuit from the commutator to the dynamo's terminals, and the highly polished brass holders also add materially to the beauty of the apparatus. On the belted units the bearings are self-oiling and self-aligning, securely held in pedestals cast integral with the base frames.



LE VALLEY VITAE CARBON BRUSH

They are also provided with sliding base rails having convenient ratchet screws attached to tighten and loosen the belt. Taken as a whole, the generators are neat and pleasing in design, thorough in construction, and so conservatively rated that, it is claimed, they may be operated continuously under 25 per cent. overload with temperatures not exceeding 50° C. above the surrounding atmosphere, and with temporary overloads of 50 per cent. without injury in any way. They are made for direct-connected, slow and moderate speeds, and average in size from three-fourths kilowatt up to 300 kilowatts in the generator, and from one horse power to 400 horse power in the motor size.

Bullock Generators and Motors.

During the last few months the Bullock Electric Manufacturing company of Cincinnati has placed several new machines upon the market, all of which have been received with marked favor. One of the latest types is the engine-generator, which has attracted particular attention, on account of its superiority of workmanship and finish. Another is the Bullock motor of the enclosed type E, class, shown in Fig. 1. This motor was designed espe-

FIG. 1. BULLOCK GENERATORS AND MOTORS.

cially for a line-shaft motor, but it can be used in any connection. It was planned to occupy as small a space as possible and still give the maximum power. It is a very neat and compact machine and is protected from dirt and dust. These motors are in use in the large pressrooms of New York.

An order has just been filed with the company for an 80 horse power motor to be directly connected to the new press which is being installed in the New York World office, and will be the largest printing press in existence. The Bullock company has also received the order for the entire equipment of Armour's new plant in South Omaha, which will be entirely operated by electricity, both for power and lighting, and will be the largest establishment of this kind in this country where electricity is used exclusively. There will be 22 motors used in this plant, and this will reduce the use of shafting and belting to a minimum; a saving of power and space which all manufactures can appreciate. The first generator for this plant has just been shipped.

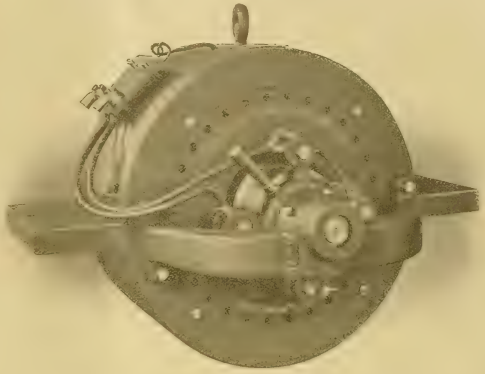


FIG 2. BULLOCK GENERATORS AND MOTORS.

It is a 200 kilowatt compound wound, eight pole machine. It has ventilated windings, self-oiling bearings, laminated pole-pieces and slotted armatures. It is machine-formed and has removable field and armature coils. All these machines are guaranteed to be free from electrical and mechanical defects and are not allowed to leave the factory until they have been tested for hours under varying loads and have run sparklessly, showing perfect regulation through this test.

Fig. 2 is a motor for direct connection to all web printing presses.

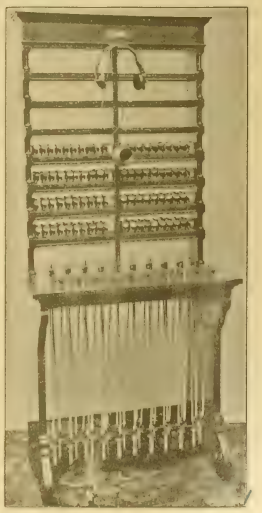
The shops of the Bullock company are unable to turn out machines fast enough to keep pace with the orders, and the company has now decided to change their location to some situation where a more extensive factory may be built. As soon as

Le Valley Vitae Carbon Brush.

The Le Valley Vitae carbon brush, for [illegible] generators and motors, is [illegible] treated carbon brush. No [illegible] is employed in the treatment and in connecting the segment up so commutators will not collect dirt or grime. In the treatment the gases are entirely extracted leaving the carbon open for treatment, then it is put through a [illegible] process which enables the brush to [illegible] constantly and uniformly, as it slowly wears away, preserving at all times an even, bright and polished surface. The company uses the word Vitae, because of the claim that it is the only brush made that properly lubricates the commutator, keeping it cool, never sparking under varying load, and therefore insuring at least treble the ordinary life to both commutator and brushes, and insuring also from seven to

to degrees cooler temperature than any other brush manufactured. The claim is also made that it is a lower resistance brush and has greater conductivity, conveying the entire current without loss, and also that it wears perfectly smooth. It neither crumbles nor breaks and requires no attention.

The Le Valley Vitae Carbon Brush company, the



[illegible] manufacturing [illegible] a compound which [illegible] commutator will keep all sparking and prevent wear of the commutator bars, the [illegible] brushes [illegible] and [illegible] the [illegible] brush. The company is located at [illegible] Liberty street New York.

Central Switchboard.

The Central Electric and [illegible] at Lewis, Me., has just perfected [illegible] switchboard [illegible] the [illegible] conductors [illegible] any

switchboard on the market, and also to possess the advantage of being built on the increase plan, whereby the purchaser may select a cabinet of sufficient capacity to accommodate as many drops as he may consider will possibly be needed and have installed only the number of drops actually needed to start with.

The drops and spring-jacks are placed on each shelf and the purchaser has as many shelves filled as desired. When increase is necessary vacant shelves, which are detachable, may be sent to the factory, filled and placed in the cabinet by the most inexperienced person.

Each drop is composed of two coils wound to resistances which equalize the drawing power of both magnets. This is especially desirable where long lines are connected to switchboards, as it requires but little power to create magnetism in these drops, and with the drawing of both magnets an indicator may be dropped when the call is made over much longer lines than can be successfully attached to the majority of switchboards. All drops are so placed that when indicators are raised no part of the drops projects in front of the spring-jacks; therefore, an operator cannot, by accident, drop an indicator while connecting cords.

Each spring-jack is directly beneath the indicator of the drop to which it is connected, so that the operator has only to look once when the call is made and can plug in and raise the indicator with one hand at the same time.

One of the greatest advantages possessed by this switchboard is in the plug connections. Each set of plugs is composed of a long and short plug. The short plug is inserted in the spring-jack of the line calling, which connects the subscriber directly to operator's transmitter and receiver. As gravity batteries are used for transmitter, no receiver switch-hook is necessary to open or close the battery circuit. When the operator is informed of line wanted, he leaves the short plug in the spring-jack of the subscriber calling and takes the long plug of the same set and inserts it in the spring-jack of the line wanted. This plug automatically cuts out the drop and connects the generator directly to line, thus leaving absolutely no resistance in switchboard for generator current to overcome, and on this account calls from the switchboard may be made over even longer lines than the same generator would ring if connected in magneto bell on a telephone. As soon as subscriber wanted has been called, the operator throws the knife-switch in front of the plugs to the opposite side, and both cords are then in the same circuit and all parts of switchboard are cut out with the exception of one drop, which remains in circuit for the purpose of notifying the operator when conversation is finished. Any short plug may be used for the listening plug if desired.

The entire space occupied by 100 drops and spring is only 20 inches by 24 inches, and a board of 200 drops may be arranged so that one operator could reach each drop and spring-jack without leaving the chair. Each drop is distinct, and as the line wire is connected to the binding post in the rear of each drop, there is no mass of wires connecting various parts of the switchboard.

Each cabinet is furnished with a perfection long-distance granular carbon transmitter, mounted in short nickel-plated adjustable arm, which is attached to the cabinet directly in front of where the operator will sit. The cabinets for switchboards are made from seasoned cherry wood, which is highly polished

Philadelphia Trolley Accident.

An accident on a trolley line in Philadelphia recently resulted in a serious injury to several passengers. A car was descending the steep grade on Leverington avenue, leading to the Philadelphia and Reading railway tracks, when the brakes refused to act, and despite the large quantity of sand poured on the slippery rails, the car shot down the incline, gathering momentum at every foot. The motorman worked at the brakes and sand-box and the conductor was called to his assistance, but their combined efforts failed to check the flying car.

Just below Silverwood street another car stood waiting to transfer passengers on the approaching car for the Pennsylvania station. The motorman of the waiting car saw the runaway car, but too late even to release the brakes on his own car. It jumped the rails at the Silverwood street turn and was hurled with great force partly against the front of the "dinky" and partly against a lamppost and fireplug standing at the curb.

The motorman was thrown from the waiting car and escaped with a few bruises, but the crew of the runaway were not so fortunate. The conductor was the chief victim. His right arm and leg were crushed and torn. The motorman was also terribly cut on the head and arms. Of the passengers on the runaway car none escaped injury. The wreck took fire from the heater, and one of the cars was destroyed completely.

One Effect of Long-distance Telephony.

An interesting statement is attributed to President S. R. Callaway of the Lake Shore and Michigan Southern railway. "For some time," Mr. Callaway says, "railroad men have been trying to find the reason why, in spite of the fact that business is increasing, especially in the transportation of freight, the passenger business is languishing. After figuring on the matter for some time we have come to the conclusion that the long-distance telephone is responsible. Business men are using it more and more, and the way it is cutting into our passenger business is a very serious matter to us."

CORRESPONDENCE.

New York Notes.

New York, December 27.—Telephone exchange girls will be interested in the fact that one, at least, of their number was generously remembered by patrons of the company on Christmas. Miss Bertha Sherwood, local operator in Port Chester for the New York Telephone company, is the young lady so honored. She says that a coachman stopped at her home before breakfast and delivered an envelope containing a $100 bill. The man hurriedly mounted the box and drove away, saying that he was under instructions not to disclose the name of the giver. On reaching the office Miss Sherwood found $5 from the Fire Department, $5 from a transportation company and $10 from "Cash." A diamond hatpin, eight yards of blue serge cloth, a set of silver nutpicks, eight boxes of candies and a case of champagne arrived at intervals during the day. The Republican headquarters in the recent Congress and county campaigns were in Port Chester, and Miss Sherwood thinks that the politicians who kept her busy all summer, and caused her to lose her vacation, have been seized with remorse and made the gifts as a recompense.

A decision has been handed down by Justice McLaughlin in the Supreme Court against the Electric Power company in a suit against the city to recover damages for the removal and destruction of its wires. The suit involves the question of the right of the city to remove wires from over housetops after having served notice on the company that such wires must be placed in subway conduits. Justice McLaughlin says that the company obtained the right to put up wires under the express condition that they were subject to the control of the city, and that they should be placed in subways. In asking the court to hold that the subway plan in certain designated streets was not feasible the justice says that the company is asking the court to override the will of the people. The question of danger, Justice McLaughlin says, is not worthy of consideration.

William Houston Kenyon, who has been elected chairman of the Committee of Fifty-three which is preparing the way for the new organization of Republicans of this city, is one of the leading patent lawyers of New York. He is a partner in the legal firm of Witter & Kenyon. Mr. Kenyon has been identified with many of the most important patent causes which have arisen within the last 15 years, among them being the telephone cases, the Brush electric arc lamp and dynamo and storage-battery cases, the Edison electric incandescent lamp litigation, the Bate refrigerator contest, and latterly the trolley suits.

Permission has been granted the Metropolitan Street Railway company of this city, by the State Railroad Commission, to adopt the underground electric trolley system as a motive power on that portion of the New York and Harlem railroad leased by the Metropolitan on Thirty-fourth street, from Second avenue to the Long Island ferry. In consequence of the large number of cars of the several lines making terminals at the ferry in East Thirty-fourth street, the Railroad Commission has advised the Metropolitan company that sufficient flagmen, trackmen and safety devices on the cars must be provided to guarantee the safety of passengers and pedestrians. Permission has been granted the Second Avenue Railroad company of New York city to adopt the underground trolley system on that portion of its line on Ninety-sixth street between First and Second avenues.

The Sun says that while it is not true that the Metropolitan and Third Avenue Railroad companies have consolidated, "it is true that the companies have buried the hatchet, and will stop suing and enjoining each other." It is said that amicable adjustment of present and future differences is contemplated. Each line will be permitted to extend itself in natural directions, under municipal supervision, without opposition from the other company. This will do away with the opposition of the Metropolitan interests to the Kingsbridge [illegible] of the Third avenue line as well as with the [illegible] tion of the Third Avenue company to the Metropolitan company introducing the electric system into Park row or putting in the electric conduits under the tracks of the Third avenue [illegible] Grand and Broome streets. These latter electric connection will be made as soon as the engineers of the two companies can agree on the best plan. The new arrangement will be in no sense a consolidation of the roads, and each will continue to operate its lines independent of the other.

M. S.

PERSONAL.

A. T. Clark, treasurer of the American Circular Loom company of 620 Atlantic avenue, Boston, was a Chicago visitor during the holidays

The retirement of N. C. Hawks and Philip M. Reynolds from the Anchor Electric company of Boston is announced. Mr. Hawks was president and Mr. Reynolds treasurer of the Anchor company.

According to a dispatch from New York, Professor Alexander Melville Bell, the distinguished scientist of Edinburg, Scotland, and the father of Alexander Graham Bell, the inventor of the telephone, will wed Mrs. H. G. Shelby of Toronto in New York within the next two weeks. The exact date of the marriage has not yet been fixed, it is said, and the place of the ceremony is to be kept a secret, as it is desired that the wedding shall be private.

Gossip concerning the affairs of the Chicago City Railway company is now quite generally to the effect that General Manager M. K. Bowen will be elevated to the presidency of the company at the annual meeting to be held shortly. The Chicago Chronicle says: "Up to this time Joseph Leiter, D. G. Hamilton and Mr. Bowen have been about even favorites in the guessing as to who would succeed President Wheeler on his retirement, but it is now claimed the Leiter interest is supporting Bowen for the place, and it is claimed the latter has sufficient backing to secure his election to the important position. Of course, a change in plans may occur before the holding of the annual meeting." A gentleman familiar with the situation said last week that if Mr. Wheeler desired a re-election he would certainly continue at the head of the corporation.

ELECTRIC LIGHTING.

The sale of the Commonwealth electric ordinance last week is announced, but there seems to be some doubt as to the identity of the purchaser. The opinion prevails that an agreement has been reached between the Chicago Edison company and the Walsh interests, by which the privileges of this franchise are to be shared. It is well known that these interests are working together, but a formal consolidation is not expected.

The Laramie Electric, Gas Light and Fuel company of Laramie Wyo., is in the market for two 12 by 12 self-oiling engines and two directly connected 50 kilowatt generators of the latest design. It is also its intention to re-wire the municipal system for 15 arc lamps and 100 incandescent lamps, to be supplied from the incandescent circuit. No change will be made in the domestic system except to connect the new generators with the wires of the domestic system, and thus relieve the old engines and dynamos of part of their load.

The electric light company of Bedford City, Va., has notified the council of that city that it would not renew the contract expiring January 1st, under which it furnished the town lights at $70 per year, but would be compelled to charge $80. The company also submitted a proposition to turn over the plant to the town for six or twelve months on condition that the property be kept in good condition and the interest on $12,500 mortgage bonds at five per cent. paid during the time the plant was under the town's control. The light question has been a bone of contention for some time, and it was decided about eight months ago to put oil lamps in, and the lamps were purchased, but changes having been made in the personnel of the council, the lamps were sent back, and a contract made with the light company at $70 until January 1st.

ELECTRICAL SECURITIES.

The Edison Electric Illuminating company of New York has declared a quarterly dividend of 1½ per cent., payable February 1st.

The Westinghouse Electric and Manufacturing company has declared a quarterly dividend of 1¾ per cent. on its preferred stock, payable January 3d.

The Belle City Electric Street Railway company of Racine, Wis., which was sold to bondholders July 20th for $150,000 and was reorganized, has executed a $250,000 mortgage to the Illinois Trust and Savings Bank, Chicago, which will act as trustee on the company's bonds.

Part of the $1,000,000 Corrigan consolidated street railway first mortgage five per cent. bonds have been called for redemption. This railway is a part of the Metropolitan system of Kansas City, a large interest in which is owned by Chicago capital. The bonds will be paid at the offices of the Central Trust company of New York at the rate of $1,100 per bond.

The North Shore Traction company of Boston reports gross earnings for November of $105,481, an increase of $3,103 as compared with the same month of last year, and net $36,880, a decrease of $1,422. For the [illegible] months ended November 30th the gross earnings were $1,342,281, an increase of $6[illegible] as compared with the corresponding period of last year, and net $[illegible]70,621, an increase of $6,932.

The governing committee of the New York Stock Exchange has listed the Brooklyn Rapid Transit company's additional issue of five per cent. 50 year gold bonds, $1,217,000, making total amount listed $6,308,000. These bonds are issued for the purchase of a controlling interest in the Sea View Railroad company, $37,500 first mortgage bonds of that company and bonds of the Brooklyn, Queens County and Suburban Railroad company.

Subscriptions are asked at $40 per share, ex the

January dividend, for 60,000 shares of the five per cent. cumulative preferred stock of the United Traction company of Pittsburg. The amount offered is the total of the preferred stock, the par value of which is $50 per share, and at the price offered it yields 6¼ per cent. The United Traction company is a consolidation of practically all of the street railroads of Pittsburg, and it operates 117 miles in Pittsburg and neighboring cities, under a franchise running for 999 years. According to the statistics of operation furnished by the company, the lines composing the system earned prior to the consolidation a sufficient amount to pay the interest on all obligations and the dividend upon the preferred stock. Within the five months since the consolidation the net earnings in excess of fixed charges and the dividend upon the preferred stock were $28,270.

TELEGRAPH.

The Western Union Telegraph company has petitioned the Federal Court for three months' time before being forced to separate its property from the Union Pacific. The petition asserts that the purchasers of the Union Pacific are not yet even known, as the purchasing committee is the only known responsible head. The separation cannot be made until the Kansas Pacific is sold.

ELECTRIC RAILWAYS.

The building of the Bluff City electric street railway at Highland Park, Ill., has been stopped. The Thompson estate has secured an injunction restraining the road from further construction work in front of a piece of its property.

At the annual meeting of the Birmingham Railway and Electric company at Birmingham, Ala., recently, Col. A. M. Shook was elected president; Robert Jemison, first vice-president; William A. Walker, second vice-president, and John B. McClary, general manger.

By a curious coincidence about 50 of the Metropolitan elevated trains of Chicago undertook to start at the same instant on Monday. The demand for current was more than the power house could respond to. The effort to comply disabled three out of the four engines, it is said, and the number of trains was decreased until repairs were made.

By a unanimous vote of the Chicago City Council an ordinance granting one year extension of time to the Northwestern Elevated Railroad company was passed Wednesday evening, December 29th. This gives the Yerkes company until January 1, 1899, to complete the construction of the road and have it in operation. Thus, the $3,500,000 bond deal which hung in the balance pending the disposition of this ordinance may now be said to be safely landed.

The burning of the Coliseum in Chicago affected Alley "L" stock slightly, the quotations before and after the fire being 62⅝ and 61⅛ respectively. The idea, of course, is that a good source of business is gone. However, traffic returns are most encouraging Last week was the largest since the close of the World's Fair. The total number of passengers carried was 437,738, or a daily average of 62,534. This is 5,761 ahead of the daily record for the week ended December 19th. The big gain was, of course, due very largely to the rush of travel occasioned by the Chirstmas shopping.

In explaining a rear-end collision at the Twelfth street station on Monday, General Manager Hopkins of the Chicago South Side elevated railroad said: "The accident could not have happened if we had not been obliged temporarily to discontinue the block system of signals on account of the alterations made in changing from steam to electricity. We will soon have our electric cars running. Our power house at Fortieth and State streets is completed, we have the third rails laid and one-third of the cars delivered. All we have to do now is to get the rest of the cars and set up our machinery. I think we will be able to make our trial trip about March 1st."

TRADE NEWS.

The Murray Iron Works company of Burlington, Iowa, has begun suit against R. G. Dun & Co. for $20,000 damages alleged to have been sustained through the publication of an erroneous statement affecting the credit of the plaintiff.

To newspaper men the "compliments of the season" from the Joseph Dixon Crucible company of Jersey City, N. J., are particularly appropriate and always appreciated. A box of the excellent Dixon lead-pencils directs attention to the undisputed fact that all the graphite products of the company are of the highest quality.

Judging from the holiday sample of the Monarch incandescent lamp sent out by the Western Electrical Supply company of St. Louis, the product must be of unusual excellence. By personal test it is known that the sample is a good one, while the Monarch lamps generally are guaranteed to burn as evenly, with a brighter light, and to give much longer service than the sample. It may be stated that the sample lamp has a cigar for a filament. The idea is very cleverly carried out and results in the combination of a good cigar in a good lamp from a good company.

The Otto Gas Engine Works of Philadelphia, which produces the well-known "Otto" gas engines, has plenty of orders on hand, and the management reports that business is particularly good at this time. The company has recently installed two 110 horse power engines in Sisterville, W. Va., for electric lighting purposes, and has also made an installation in Mannington, W. Va.

The Hope Electric Appliance company of Providence, R.I., reports that the capital stock is increased from $60,000 to $100,000, in order to meet the large increase in business. The demand has far exceeded the company's ability to manufacture. The Hope company's instantaneous single and double-throw switches have recently been the subject of a special circular from the National Board of Fire Underwriters.

V. E. Raggio, the energetic representative of the Commercial Electrical Supply company of St. Louis, who devotes his attention to Texas, spent Christmas in Chicago. Mr. Raggio reports a rapidly growing interest in Texas and other southwestern states in all electrical matters, and predicts a continued increase in the prosperity of that section. The Commercial company has many friends in that country and the number is being daily increased through Mr. Raggio's aggressive work and business-like methods.

The M. C. Bullock Manufacturing company of Chicago reports that it has, within the last few months, furnished power for nearly 1,700 2,000 candle power lights—mainly 125-light machines, direct-coupled to central-valve engines. The company builds a vertical engine, either compound or triple-expansion, with three cranks set at 120°, which, when direct-coupled to two 125-light machines, make a compact 250-light set. The actual floor space taken by both engines and dynamos is a little less than 100 square feet, or a trifle under four-tenths of a square foot of floor space per lamp. It is evident, therefore, that the proposal of this company to furnish one 2,000 candle power lamp for each square foot of floor space is entirely safe. The company reports that high economy is nearly always demanded, and a number of the engines installed for this work are triple-expansion condensing, using high-pressure steam and guaranteed to use less than 13 pounds of steam per indicated horse power hour. Among recent orders the M. C. Bullock Manufacturing company reports three 200 horse power triple-expansion condensing engines for the Nichols Chemical company of New York. These engines are to run 30 to 90 days under full load without closing the throttle. This make four engines furnished to this company for this service within the last year. Another recent order was for a 100 horse power compound for Spofford & Mills of Chicago to furnish power for electric lights in their new building. This is popularly known as the Boston restaurant plant, and, like everything else in the building, is being fitted up in very attractive shape. The dynamo is of the Western Electric type, and the combined set is exceedingly compact and neat in appearance.

BUSINESS.

The American Rheostat company of Milwaukee has opened a Chicago office at 1104 Rookery building with a full and complete line of rheostats for all purposes. The George Cutter company will represent the American company in this city.

The McFell Electric company, Chicago, is making a strong bid for construction and repair work and is pushing its telephone business. As is well known, the company handles the famous Ericsson Swedish telephones. The McFell company has earned an excellent reputation in the trade and has made several exceptionally inte sting installations.

Calendars for 1898 have been received by the Western Electrician from the Leschen-Macomber-Whyte company, 19 and 21 South Canal street, Chicago; American Electrical Works, Phillipsdale, R. I.; Menominee Electric and Mechanical company, Menominee, Mich.; Paper Mills' company, Chicago, and the New York Life Insurance company.

Take your choice over Pennsylvania Short Lines. Trains leave Chicago union station 10 a. m. and 8:15 p. m. daily. Passengers on morning train arrive Jacksonville second evening, and on night train early second morning. Tourist tickets to leading resorts in Florida and the southern states, with return limit covering the entire season Ascertain particulars by addressing H. R. Dering, assistant general passenger agent, 248 South Clark street, Chicago.

The Electric Appliance company is congratulating itself upon the great record that is being made by O. K. weather-proof wire. Although this wire has been on the market for about 10 years, it is stated that there is not a single recorded case where the insulation has not given the best of satisfaction. O. K. weather-proof insulation has never been known to come off of the wire, and wherever used the insulation is good and hard after five or 10 years of service. With this insulation, it is pointed out that a line with the insulation hanging in shreds or strings is an impossibility, as the insulation is put on in such a way that it is next to impossible for it to strip off. O. K. wire costs no more than other brands and is deservedly popular.

The Electric Railway Equipment company of Cincinnati, O., reports that business has improved wonderfully in the last few months. Its steel tubular pole department has been working day and night since last September manufacturing poles for electric railways and arc lighting. The brass foundry is also working day and night, and the company has secured some large contracts for railway supplies. Its new mast arm, with automatic cut-out, is claimed to be the best on the market, and the company will be glad to correspond with anyone in want of arc lamp mast arms.

George W. Patterson has recently been appointed western representative in charge of the well-known office of the American Circular Loom company, at 1114 Marquette building, Chicago. Mr. Patterson is known to the trade as western agent for the Gordon-Burnham and Law primary and Ohio storage batteries, and Medbery knife switches and overhead railway material, which he will still represent. Mr. Patterson reports business good for the season, but regrets it is not fashionable to make Christmas presents of anything in his line; however, the demand still continues for his business card showing "Periods When to Make Money."

Hugo Reisinger of New York makes the following statement: "I wish to inform the trade that the word 'Electra' has been properly registered by me as my trademark and therefore cannot be used by anybody else without infringing on my rights. The 'Electra' carbons are made, as heretofore, by C. Conradty, Nuernberg, who owns not only the oldest, but the most extensive carbon works in existence, and whose carbons remain unequaled in quality and efficiency, having become the standard for electric lighting the world over. As to parties reported as makers of 'Electra' carbons, I wish to state that I have brought suit against them for having misused the trademark 'Electra,' and that they have been enjoined by the Nuernberg courts from making any carbons stamped 'Electra,' under penalty of 100 marks for each carbon. I shall guard the interest of buyers of my carbons as heretofore, and any information in regard to infringements on the registered trademark 'Electra' that will enable me to take legal proceedings will be gratefuly received."

The Raster Carbon Rheostat company wishes to call attention to its new resistances, which can be used for starting boxes, regulating resistances, rheostats for arc lamps, testing of alternating dynamos and car-heating apparatus. Their superiority lies in the use of special carbons instead of wire. The carbons are imbedded in an insulating substance, which absorbs and dissipates the heat, serves as a protection from outside influences, is absolutely fireproof, and never heats to such an extent as to char wood or any other material, when in service. The advantages of such resistances, after thorough experimenting, have been found to be that they cannot burn out like wire coils, when overloaded; they allow the selection of larger cross-sections, because of their high resistance and afford greater capacity and durability; they are the only resistances not subjected to induction currents, and therefore the only practical instruments, excepting lampboard rheostats, for tests with alternating dynamos, and they retain an almost equal resistance whether hot or cold. They are incased in a handsome iron box with a face-plate. The starting boxes safely permit a continuous current of two minutes, as against the outside limit of 30 seconds, allowed by makers of wire resistances. Furthermore, they are provided with an automatic release. All resistances are tested with an overload of 25 per cent., and starting boxes in particular must carry a current of 25 per cent. above their guaranteed capacity for two consecutive minutes before they are pronounced perfect.

The Ohio Electric Specialty Manufacturing company calls attention to the many features of superiority of the woven wire brush. It was at first thought that the brush must of necessity be made of copper cloth, but that has been found to be both practically and theoretically wrong. The Ohio Electric Specialty Manufacturing company of Troy, O., is putting out an improved article and claims to have remedied the defects of the early types The company sends brushes out on trial with the privilege of returning them at its expense. The brush, it is said, cannot spread out on the commutator owing to its peculiar construction. It is made of gauze and is superior to copper, as it reduces the friction and necessarily the heat in the armature. It is lubricated and does away with the use of compounds on the commutator. It is made flexible as the buyer desires, either longitudinally laterally or both. It will adjust itself to any irregularity in the commutator The brush is [illegible] a remarkable sale, considering the time it [illegible] on the market, and can be purchased of [illegible] leading supply houses. The Ohio Electric [illegible] Manufacturing company is also making [illegible] other high-grade specialties, including the [illegible] rheostats and Rogers lubricant, for use on machine where the use of a commutator lubricant is imperative. Samples of the Perfection dynamo brush, with descriptive circulars and prices, can be procured from the Ohio Electric Specialty Manufacturing company, Troy, Ohio.

ILLUSTRATED ELECTRICAL PATENT RECORD.

Issued December 21, 1897

595,[illegible]. Suspension [illegible] Electric Cables. George [illegible] Cambridge, Boston, Mass. Application filed July 24, 1897.

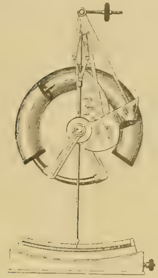
A cable hanger consisting of a [illegible] and a flexible insulating cord [illegible] and adapted to be wound around a cable.

595,695. Electric Accumulator. Clovis P. F. Clerc and Adolphe G. Pingault, Paris, France. Application filed December 5, 1896. Patented in Belgium August 8, 1896.

Essential features are plates carrying active material, perforated non-inductive coverings surrounding the plates on their sides and bottoms whereby when plates and coverings are lifted out any active material which may have become loosened from the plates will be taken out also; an insulating cell inclosing the parts, an inclosing case having a cover, a cut-out or similar sheet on the lower side of the cover, the sheet and cover pressing against the end of the cell and forming a cover for it also.

595,731. Electric Motor. Maurice B. Pengnet, Cambridge, Mass. Application filed March 31, 1897.

A portable electric motor for small work is combined with a plurality of independent tool-engaging means rigidly secured thereto, so that the motor and tool-engaging means constitute one rigid structure, individual tool-engaging means being driven at different rates of speed by the motor.



NO. 595,751

595,751. Wattmeter. Ernest K. Adams, New York, N. Y. Application filed September 11, 1897.

The wattmeter has an arm capable of displacements proportional to logarithms of the number of watts in the circuit to be measured, an index or marker and means for converting the displacements of the arm into displacements of the index or pointer proportionate to the number of watt.

595,768. Electric Controlling Device for Paper-feeding Machines. Talbot C. Dexter, Pearl River, N. Y., and Clarence Ransom, Jersey City, N. J. Application filed September 16, 1896.

The [illegible] an electrically controlled paper-feeding device, a double-armed electric contact lever supported above the path of the paper upon suitable bearings and [illegible] grooved insulated block supported [illegible] the plane of feed of the paper, one arm of the contact lever resting in the groove of the block in the path of the paper and adapted to be moved out of the groove by [illegible] into which the other of the arms dips.

595,777. [illegible] Hamburg, Germany. Application filed November 16, 1896.

[illegible]

595,80[illegible]. [illegible] Application [illegible]

An [illegible] electric contact [illegible] act to [illegible] contact point [illegible] arm to [illegible] position.

595,821. Method [illegible] and Apparatus [illegible] Meters. [illegible] Washington, D. C. [illegible] 27, 1897.

The [illegible] device [illegible] parate from [illegible] the other [illegible] the ground.

595,827. [illegible] Brooklyn, N. Y. [illegible] 1897.

A device [illegible] adapted to be [illegible] for the [illegible] movable [illegible] mently mounted [illegible] relatively to [illegible] ment.

[illegible],841. Electric Motor. [illegible] cago, Ill. Application filed [illegible]

An electric motor having [illegible] with a greater number of [illegible]

current flowing in one direction than for the current flowing in the opposite direction is one of the features.

595,842. Circuit-closing Device for Burglar Alarms. Elmer E. Wilson, Blackwood, N. J. Application filed August 18, 1897.

Claim is made for a plate having an opening therein, a spring secured at one end to the plate, a cam pivoted to the other end of the spring and projecting through the opening, a contact piece having one limb secured to but electrically insulated from the plate, and its other limb adapted to be in contact with the cam when the latter is raised by an upward movement of a sash, and an electric circuit having an alarm therein and connections with the contact piece and plate.

595,868. Reversing and Cutting-out Switch for Electric Motors. Thorsten von Zweigbergk, Cleveland, Ohio. Application filed September 20, 1897.

A reversing switch is described, having two homologous series of contact plates, one of the series having consecutive plates connected together and the other series having alternate plates connected together, and two series of contact fingers, each series adapted to engage with either series of contact plates, the relative disposition of the contact plates and fingers being such that when one series of contact fingers is in engagement with one series of plates the other series of contact fingers is in engagement with the other series of plates, there being provision for relative movement between the contact plates and contact fingers.

595,871. Electric Burglar and Fire Alarm. Charles J. Bukoutz, Lamoille, Ill. Application filed April 19, 1897.

This is an automatic system, comprising a telephone call provided with a shaft and crank-arm, a spool or drum loosely mounted on the shaft and provided with a cord and weight, a removable pin, a pivoted pawl adapted to project into the path of the arm and the spring connected to the pawl, in combination with the combustible cord having one end fixed to the pawl and the other end connected to a door, window or other suitable point within the premises.

595,874. Electric Elevator. Augustus L. Duwelius, Cincinnati, Ohio. Application filed February 18, 1892.

One of the features described is a field magnet governor, consisting of a shaft, a carrier mounted thereon, weights of sector form pivoted to the carrier, an end-thrust guided by the carrier, an equalizer thereon and a connection between the equalizer and each of the weights.

595,887. High-tension Switch. Hermann Müller, Nuremberg, Germany. Application filed June 2, 1897.

This switch consists of groups of contact rollers made from easily oxidizable non-arcing metal, the groups of rollers being mounted on spring-arms, each roller being normally out of contact with the others, and means for forcing the rollers into contact with each other, while simultaneously a turning motion is imparted to the same.

595,898. Electric Motor. Fenner E. Whipple and Charles A. Stauffer, Philadelphia, Pa. Application filed May 1, 1896.

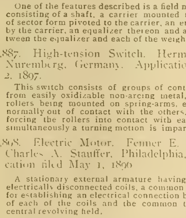
A stationary external armature having three or more electrically disconnected coils, a common terminal, means for establishing an electrical connection between one end of each of the coils and the common terminal, and a central revolving field.

595,936. Electric Arc Lamp. Antoine Blahnik, Paris, France. Application filed July 10, 1896. Patented in France February 4, 1896.

In a regulating apparatus for arc lamps there is the combination with a pulley, of two rotary disks formed of magnetic metal and eccentrically supported on each side of the pulley, a flexible band lying upon the peripheries of the pulley and disks, means for applying tension to the band and an electro-magnet and armature arranged to exert attraction on the disks proportioned to the variations in the current intensity.

595,963. Electric Burglar Alarm. David W. McCaughey, Chicago, Ill. Application filed November 27, 1896.

The device consists of the combination of a terminal or contact point, a longitudinally movable insulating block in which it is mounted, a hard metallic sleeve for protecting one end of the insulating block, and another hard metallic tube in which the parts are mounted for protecting the same.



[illegible]

body portion extending beyond the shouldered portion, a terminal mounted against the face of the shouldered portion, and a threaded terminal mounted upon the end of the extending body portion.

595,983. Telephone Repeater. William H. M. Weaver, Macon, Ga. Application filed September 4, 1897.

The cut illustrates a telephone repeater, comprising two or more stations, each equipped with a receiver and an induction coil transmitter, intermediate repeating devices comprising two receivers and two induction coils, with their primary wires extended to and provided with contact devices operated by the diaphragms of the receivers of the repeating devices, each receiver and induction coil of the repeating devices being in the main-line circuit of one station and a common return circuit connecting the main circuit at each station at a point between its receiver and transmitter, with the main circuit between the receivers and induction coils of the repeating devices, and also connecting the main circuits between the receiver and induction coil of one side of the repeating devices with the main circuit between the receiver and induction coil on the other side of the repeating devices.

596,002. Electrical Transmission of Energy. Rudolph M. Hunter, Philadelphia, Pa. Original application filed November 9, 1887. Divided and this application filed July 28, 1891.

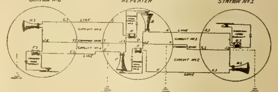
The system comprises means for generating currents of electricity of high tension, a line circuit leading therefrom to a distant place, induction apparatus for reducing potential of the line currents, a local circuit supplied with the low-tension induced currents from the induction apparatus, translating or current-consuming devices arranged in the local circuit, an induction coil having its coarse wire connected with the local circuit and in parallel with the translating or current-consuming devices, and a high-tension circuit connected with the fine wire of the induction coil and supplying current to a second local circuit insulated from the other.

596,012. Prepayment Coin-controlled Mechanism for Electric Meters. William F. Browne, New York, N. Y. Application filed October 2, 1897.

The combination is described of an electric meter, a rotary coin-pocket wheel and suitable gearing connecting the wheel with a rotary part of the meter, whereby the wheel will be rotated by the operation of the meter, and a predetermined quantity or volume of current metered to a customer by insertion of a suitable coin in the pocket-wheel.

596,017. Telephony and Telegraphy. Maurice Hutin and Maurice Leblanc, Paris, France. Application filed January 31, 1893. Patented in France September 3, 1891, and in England December 27, 1891.

The method of transmitting messages consists in passing over a line waves of alternating or varying current of such high frequency as only slightly affect the receivers, and modifying the amplitudes of these waves in accordance with the desired message.



NO 595,983.

596,032. Inductor Generator. Pomeroy W. Power, Pittsfield, Mass. Application filed September 10, 1897.

One claim is given: In an inductor generator having two crowns of induced coils on the interior of a cylindrical armature, the combination of a shaft, two inductor portions movably mounted thereon, and bearings for the shaft, the space between either of the parts and the bearing nearest thereto being substantially equal to the length of the induced coils.

596,036. Auxiliary Apparatus for Selective Electrical Signals. George W. Whittemore, Brooklyn, N. Y. Application filed September 2, 1897.

The invention comprises a telephone lock-out appliance comprising the automatic switch lever, in combination with an electro-magnet having two reversely wound or connected coils in branches extending from the main-circuit conductors respectively to a ground connection; a second electro-magnet having a single coil contained in the ground connection, an actuating armature for the double wound electro-magnet, a hook or detent lever attached thereto, an armature or shutter for the single-wound magnet normally held in its forward position by the hook lever, but adapted to move into its backward position when released therefrom by the operation of the actuating armature, and to be restored to its forward position by the direct attraction of the single-wound magnet, and a locking pin carried by the shutter armature and adapted to lock and unlock the switch lever according as the armature is in its backward or forward position.

596,0[illegible]. Electrical Transmission of Energy. Rudolph M. Hunter, Philadelphia, Pa. Original application filed February [illegible] 3, 1883. Divided and this application filed October 4, 1889.

A line conductor conveys high-tension currents of alternately rising and falling potential; a variable resistance is in the line circuit, an induction coil having its fine wire in circuit with the line, a local circuit including the coarse wire of the induction coil and a transmitting device in the local circuit consisting of an electro-magnet to vary variable resistance.

[illegible]. Transmission of Electrical Energy. Rudolph M. Hunter, Philadelphia, Pa. Original application filed June 18, 1887. Divided and this application filed April 20, 1892.

One feature is a secondary generator for electrical transmission of energy, consisting of the combination of a fine-wire coil, a line circuit including the fine-wire coil, an interrupter for the current passing through the fine-wire coil and a coarse-wire coil wound parallel to the fine-wire coil, and a local circuit including the coarse-wire coil.

Western Electrician.

EVERY SATURDAY.

Vol. XXII. CHICAGO, JANUARY 8, 1898. No. 2

Electrical Features of the Greater New York Celebration.

The cities of New York and Brooklyn and many smaller communities in the immediate vicinity ceased to exist as separate corporations on the stroke of midnight, December 31, 1897, and were merged into Greater New York, which was ushered in with due ceremony on January 1, 1898. It was a remarkable event and was without a parallel in history. The new municipality is the second city of the world in population and area, and in many respects surpasses all other communities.

The consolidation was fittingly celebrated by a public demonstration that has already received so much attention that the details are familiar to newspaper readers the world over. There were many features of interest to the electrical fraternity, however, which may be mentioned here with propriety.

The celebration began with a monster parade, which was formed in Union Square and marched down Broadway to City Hall Park. The line of march was brilliantly illuminated, many of the large establishments making a considerable display in the sky was dark and rain was falling during most of the time occupied in the celebration.

Interest centered about the City Hall, which had been gorgeously decorated for the occasion. Bunting and flags were resplendent with incandescent lamps, and every detail of the building as well as the decorations was brought out distinctly by 36 searchlights whose beams were turned upon the official headquarters of the new municipality. The picture on this page, which was made from a photograph taken

ELECTRICAL FEATURES OF THE GREATER NEW YORK CELEBRATION.

which electric lighting played an important part. In the parade itself there were many electrical features, the decorative effects of the electric lights upon the floats attracting general attention and provoking much favorable comment. One float carried a big tiger, his mouth aglow with electric lights, and a pretty girl—"The Lady and the Tiger"—beside him. Above were pictures of Richard Croker, Mayor Van Wyck and John F. Carroll, brilliantly lighted. Another float represented the Statue of Liberty in the middle of a big fountain, on which was inscribed "Meet me at the fountain." This float was drawn by 12 gray horses, with an electric light on the saddle of each. The effect was pretty. In the bicycle division one wheelman represented the Brooklyn bridge in electric lights. Half a dozen American District Telegraph messengers on wheels had a place in the line. Searchlights placed at frequent intervals along the line of march were turned upon the procession, thus affording the spectators in the upper windows of the office buildings an opportunity to witness the parade.

When the head of the procession reached City Hall Park and turned across the Plaza it was greeted with a flood of light from all the searchlights in the neighborhood. The dense mass of humanity that was packed into the inclosure before the City Hall presented a unique appearance under the beams of the searchlights. The neighborhood was made as light as noonday by the searchlights, although immediately after midnight, gives an excellent idea of the scene that greeted the spectator. Flags and shields and a huge anchor, all picked out in incandescent lamps, decorated the front of the building, and 250 twin arc lamps in colors were arranged in the park itself and heightened the effect considerably. At each wing was a large national flag in incandescent lights, arranged with longitudinal curves to simulate the floating of the ensign in a breeze and the illusion was completed by the passing across the surface of the flags of a series of shadows, so that one might look at them through narrowed eyelids and be almost persuaded that they were of some luminous fabric, really floating in the wind. Two electric shields of red, white and blue appeared near the center of the building, at either side, and between them, just over the reviewing stand, was a brilliant center piece in the shape of a huge anchor in white incandescent lights. Two strings of incandescent lights formed the halyards of the flagstaff. On top of the building were arranged searchlights which flashed upon the upturned faces of the throng below.

At midnight the climax was reached when the flag was raised over City Hall by the mayor of San Francisco, 3,000 miles away. An electric motor had been placed in the cupola to raise the flag, and precisely at midnight the mayor of San Francisco touched a key closing the circuit between San Francisco and New York and switching the current on the motor. A little ball of white bunting was seen to shoot up the flagpole, and on reaching the top the wind caught it and the flag fluttered in the breeze, while 36 searchlights were turned upon it simultaneously and cheer after cheer arose from the multitude below. It was a memorable occasion and made a lasting impression upon all who witnessed the ceremony.

The preparations for this great display were organized and executed by the New York Journal.

Chicago Electric Traction Company.

The incorporation of the Chicago Electric Traction company last week led to considerable discussion of the possibilities of a combination of the several street-railway corporations of Chicago. The new company has a capital stock of $2,000,000 and a bond issue of $1,500,000, with power to issue further bonds for extensions and additions. The stock and bonds are all owned in Philadelphia and New York. The company has organized under the general railway law of the state, which require that a majority of the directors must live in Illinois. According to the charter, the directors are Samuel R. Shipley, I. L. Rice and Henry Levis of Philadelphia, G. J. Weizlar and J. S. Bache of New York, and Charles R. Holden, Carl Mayer, William L. Tibbs, Thomas A. Moran, Jr., and Alfred S. Austrian, Chicago. The other director is E. R. Gilbert, who will be general manager of the road.

The following statement was given out by Levy Mayer, who directed the organization of the company: "The company is organized to operate a street-railway system in the southern part of the city, as the articles of incorporation state. One of the first steps of the company will be to issue $1,500,000 bonds, with possibly another issue following. It has already bought 12 franchises of roads in the southern part of the city, of which three or four are now in operation. The most important of these is the Englewood and Chicago Electric, running from Sixty-third street south and west, having a trackage of 32 miles leased to the Calumet Electric company. Franchises for further extensions of the system will be asked of the council before a great while."

There is much speculation as to the outcome of the move. By many it is believed that the new company has been organized to consolidate the Hyde South Side suburban roads, the Englewood and Chicago, the Calumet Electric and the South Chicago. The last is said to be controlled by the estate

of the late Columbus R. Cummings, which so far has shown no particular desire to sell its holdings. The Calumet Electric is owned by the National Bank of Illinois, which has put something over $2,600,000 into the line, but is understood to be willing to sell for $2,500,000. The facts that the charter permits the company to operate in all divisions of the city and is under the general railway law of the state are said to mean a great deal more than the consolidation of three suburban roads. It is claimed that Mr. Yerkes is interested, and that by obtaining the General Electric franchise all three suburban roads might get a trunk line downtown and Mr. Yerkes might force the Chicago City Railway company to accept his proposition for a consolidation of surface roads.

Eiffel Tower Struck by Lightning.

The illustration which is herewith reproduced from l'Energie Electrique was made from a photograph taken during a storm in Paris in which the Eiffel Tower was repeatedly struck by lightning. The picture graphically shows the tower looming up in the night with the lightning playing about it.

Northwestern Electrical Association.

Secretary Mercein of the Northwestern Electrical association announces that he has received assurances from Prof. R. B. Owens of the State University of Nebraska that he will present a paper upon "Electricity in Municipal Engineering" at the forthcoming meeting of the organization in Milwaukee. This completes the list of contributions for that event.

EIFFEL TOWER STRUCK BY LIGHTNING.

The committee on entertainment, which is composed of James M. Hill of Chicago, W. L. Church of Milwaukee and Charles Cuno of Oconomowoc, has arranged a very attractive programme of social features, including a theater party and banquet. Mr. Mercein has been selected to preside at the banquet, which will be sufficient to assure the members of an interesting evening.

Mr. Armstrong on Electrical Journalism.

In his review of the electrical progress of the year 1897, in the Chicago Record, Charles G. Armstrong inserts this paragraph:

"I think all engaged in electrical work will agree with me that the most potent factor in the development of this limitless agent has been the high character, the untiring energy exhibited by our various electrical journals. One who has watched their struggles, ever endeavoring to eliminate the chicanery, to expose any attempt of an unprincipled inventor to rob the ever confident public, holding up the hands of the faithful and honest worker, however humble he might be, ever ready to enlighten the public of the [illegible] [illegible] and [illegible], avoiding the [illegible] and the [illegible], cautioning the too ready investor, ever encouraging the legitimate enter[illegible] [illegible] the electrical journal [illegible] done as much as the [illegible] themselves to perfect, to ripen, as it were, into manhood this great industry. I have often wondered what the electrical interests would have done had it not been for the [illegible] enterprise of the electrical journal. Text books have often been valueless. The science has grown so rapidly that before a text book could be written and placed on the market the subject would be trite and the theories outgrown. The machines described therein would no longer have been used, new ones having been devised and placed in their stead. But meantime our faithful journals, week by week and month by month, have kept pace with the rapid trend of affairs."

Multiple-rate Metering.

By Eustace Oxley.

It is not probable that "methods of charging for current" is a subject that will now command the same general interest that has heretofore been shown, both in this country and abroad.

The reading public is growing tired of a discussion that has had little result, except the production of a great variety of conflicting opinions. Still, it is hoped that a question of such importance may not be without interest, provided it can be shown that a long step has been taken in the direction of its solution. A new system of applying the double-rate method of charging has been employed by a large electric lighting corporation in this country for five or six months. Broadly speaking, the method is well known, but its employment in this instance has been under novel conditions. The marked success which has followed, and the results that have been accomplished in solving problems of much importance to all generating companies, will lend interest to a description of the manner in which these ends have been attained.

A rational and satisfactory system of charging for current must accomplish certain results, all of which are essential, though not in the same degree. Prominent among these are three considerations which cannot well be separated: The first is to reduce the cost of generation, the second to extend the adoption of electric energy for heating, lighting, power, and all the uses for which it is so well adapted, and the third to induce all consumers to increase their consumption, economically to themselves and profitably to the generating company. Such a method must have in view the improvement of the load factor of the entire outfit, the mains as well as the generating mechanism. To do this effectively it must hold out strong inducements to all consumers to extend the hours of consumption, and to multiply the purposes for which current is used. It should not discourage an increased demand for current at any hour of the day, but it should not, on the other hand, induce large demands during those hours when the maximum output for lighting occurs. The general aim must be, as Prof. Thomson says, to "smooth out the hills and hollows of the load diagram;" and this can only be done properly by bringing the lower parts of the load curve up to the peak as nearly as possible, instead of lowering the peak itself. Finally, the method must be simple and equitable, to both the company and the consumer. A method that accomplishes all these objects would seem to be as near the ideal as possible. Experience appears to have established a general conviction that the double-rate method, or discounts based upon the time of demand, is best adapted to the main requirements. It has been widely used in different ways, and is simple and logical. To give consumers a discount, or low rate, during all hours save those in which the peak of the load occurs, and a normal or higher rate during the few hours when the maximum number of lamps will be in use, holds out the strongest inducement to the public to substitute electric energy in place of steam for power, and to employ it for many other purposes.

An increased rate during peak hours does not, in any proper sense, discourage increased demands at that time, and, on the other hand, it does not have any tendency to produce such demands. A reduced rate during the remaining hours, at the lowest figures consistent with the proper interests of the generating company, will act as a powerful inducement to the consumers to use current during those hours.

Cooking, heating and many other of the familiar processes of daily life only await the time when their performance by a servant so safe and cleanly can be had at a cost which is not prohibitive. The resulting improvement of the load factor, and the increased efficiency of the generating mechanism, will then reduce the cost of production and enable every part of the mechanism to earn its share of the fixed charges. The reduced expenses, and the larger earnings for the extinguishment of the fixed charges, will go far toward multiplying the profits of long hours' use, even at largely reduced rates. Moreover, it has been repeatedly demonstrated that such increased demand for [illegible], and the resulting improvement in the load factor of the whole outfit, is of itself the means of a great saving in the actual cost of operation.

This matter is too well understood to require any discussion, but as a single example it may be mentioned that at Brighton, England, it was found that an improvement of three per cent in the load factor had the same effect in reducing the total cost of producing electricity as if the coal bill had been reduced 15 per cent, the charge for coal in this case being $5 per ton. The importance of accomplishing results of this nature has been very generally admitted. The difficulties encountered in the use of a double-rate method have been such, however, as to seriously affect its adoption, although a large number of the leading central-station managers regard it as the most complete and simple solution of the problem. The objections urged against it seem to have been due to faults in the means by which the method has been practiced, and not to any defects inherent in the method itself.

Among the devices heretofore proposed, the best

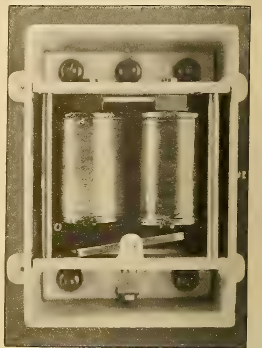


FIG. 1. MULTIPLE-RATE METERING.—CONTROLLER, DOOR REMOVED.

was probably that employing two separate meters, or meter dials, one to register all the current used during the hours when a low rate was charged, and the other to register that used at a higher rate. This required the two meters to act alternately. Their operative alternation was effected by a clock at each point of consumption. The expense of installing such apparatus upon a system of even an average extent would be large, and would materially increase the fixed charges.

But a more serious objection was found in the great liability of clock gearing to stop, or become wholly unreliable, when used to make and break an electric circuit. While this may be overcome to some extent, by using clock gearing of the best manufacture, the evil cannot be entirely eradicated, and the large increase in cost, due to the price of high-grade clock movements, would not be compensated by the removal of the objections against the cheaper grades. The frequent inspections necessary, the numerous removals of clocks for repair and regulation, and the winding and setting of a large number of such clocks, would evidently require an increase in the number of employes.

As one of the chief objects of a system of charging should be to enable the company to reduce the cost of generation, and lower the rates

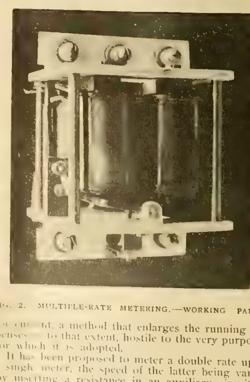

FIG. 2. MULTIPLE-RATE METERING.—WORKING PARTS.

for current, a method that enlarges the running expenses is, to that extent, hostile to the very purposes for which it is adopted.

It has been proposed to meter a double rate upon a single meter, the speed of the latter being varied by inserting a resistance in an auxiliary circuit at the central station. The plan was to connect all the meter shunts with a separate wire, run from the station to the points of consumption, and to vary the voltage on this wire by the insertion of resistance at the central station to regulate the speed

of the meters, so that they should register a part only of the current actually used, during the hours when a low rate was given. One objection to this method is, that the interruption of the auxiliary circuit would cause every meter to stop. A more serious objection, however, is that the necessary drop of voltage upon the separate wire would be likely to seriously impair the accuracy of the results obtained.

A single meter, however, can be used in a manner that removes all objection, and gives accurate registration. By the use of the same form of controller, a resistance can be inserted in each meter circuit, at the hour when the low rate is to begin, and maintained therein until the end of the low-rate period. This resistance is graduated to retard the speed of the meter to a degree representing the ratio the low rate bears to the full rate. When inserted the meter will register only a part of the current that is used. By the insertion of this same resistance at each point of consumption, the provision of an auxiliary circuit is avoided, and no inaccuracy can be produced by a drop in the voltage. This plan has the advantage of economy, by saving the expense of a second meter at each point of consumption. In some instances this saving may be important, and it is of course desirable in all cases. The plan of using two meters, registering alternately, has the merit of simplicity, and is preferred, by the average consumer, who can easily understand it, and calculate the amount of his indebtedness.

The single meters can be connected with the same ease and simplicity as the two separate meters.

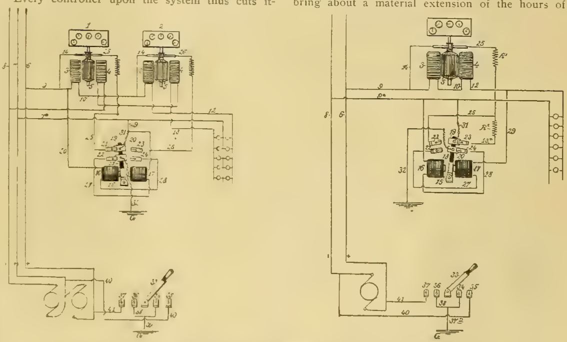
The chief difficulty in the way of the double-rate method, or, as it is sometimes termed, the differential rate, based upon the time of demand, seems to have been the absence of suitable mechanical appliances by which two meters could be duly controlled, one to meter current at a low rate and the other at a full rate and in such a manner as to fully protect the company against fraud, secure accuracy, and avoid any material increase in the fixed charges, due to large outlay for apparatus. A description of the apparatus, and the methods of controlling it, as now installed upon the system of the company using it, may prove interesting:

At each point of consumption is placed a small electro-magnetic controller-switch, which is shown in Figs. 1 and 2. The parts are all enclosed in an aluminum case, 4½ inches in length and 3½ inches in width and depth. The enclosed parts consist of two independent electro-magnets, indicated by the numerals 16 and 17 in the diagram, Fig. 3, and a pivoted arm 18 carrying an armature and knife contacts, and arranged between the electro-magnets. Upon each side of the pivoted arm are two clips, 22 and 24, which clips are connected by wires 27 and 28 to the terminals of the windings of the electro-magnets 16 and 17, the connection for each clip being made with the magnet lying on the other side of the pivoted arm. The second terminals of the windings of the magnets are connected (in a three-wire system) to the positive service wire 9, and the neutral house wire 7^a. Two clips, 21 and 23, one on each side of the pivoted arm 18, form part of the armature circuits of the two meters 1 and 2. These meters are shown in the diagram as being of the high-efficiency type of Thomson wattmeter, and they are connected with the controller at each consumer's premises by a wire led from the middle right-hand binding-post, connecting with the shunt, or armature circuit, to the right-hand terminal at the top of the controller case. This is the only change made in the normal connections. In Thomson meters of other types, not having the extra binding-post, a small hard rubber block is attached to the wooden back piece, between the binding-posts. On this rubber a narrow strip of brass is mounted, having a small screw at each end, to connect with the terminal of the controller, and with one of the armature connections. In meters having shunt circuits, such, for example, as the Edison chemical meters, as well as other types, the manner of connecting the controller is practically the same. In some forms of meters, however, as those provided with a series winding only, a modified construction of the controller is used, by which each meter is wholly disconnected, when its period of registration is terminated. The pivoted arm 18 carries two knife contacts, 19 and 20, one of which is connected to earth, and the other to the neutral house wire. The knife 20, having an earth connection, is struck into one or the other of the two clips, 22 or 24, which connect with the terminals of the two electro-magnets. One of these controllers is placed at each point of consumption. It will be seen that by throwing the pivoted arm 18 to one side, the armature circuit of one meter is opened by the withdrawal of the upper knife, 19, from one of the clips, 21 or 23, while the entrance of the knife in the clip on the other side of the pivoted arm completes the armature circuit of the other meter.

The whole system of meters is controlled from the central station, where a small double-throw switch is placed. Two of its clips, 34 and 36, one on each side of the switch-arm 33, have an earth connection. Clip 37, on one side is connected to the positive, and the clip on the other side is connected to the neutral of the system. When the arm of the switch is closed, or thrown into the clips on one side, the circuit will be from the positive, over the switch-arm 33 and clip 36 to earth, then at each consumer's station, by the lower knife 20 and the switch-arm 18, through the clip 22, in which the knife 20 is lying, thence through the winding of the magnet 17, on the other side of the switch-arm 18, and then to the neutral house wire and main. The switch-arms at all points on the system are by these means thrown simultaneously into the clips, opposite those in which the knives were resting. At the instant when the lower knife on the controller arm withdraws from the clip in which it rests, the circuit of the electro-magnet that produces the movement of the arm is opened at the clip. As the same knife strikes into the corresponding clip on the other side of the controller-arm 18, it completes at that point the circuit of the magnet which will be energized when the switch at the central station is thrown into the two clips opposite those in which the switch was previously closed. An indicator is arranged at the central station, to show at any moment at which rate current is being metered. It consists of two dials, having suitable words inscribed, to denote the difference—"Day" on one and "Night" on the other dial answers the purpose. The two dials are illuminated by lamps, placed behind them, and cut in alternately by the operation of the station switch.

Several things are noticeable in the arrangement described: First, the automatic breaking of the circuit of the electro-magnet, by which the throw of the pivoted arm of the controller is produced, and the completion of the circuit of the other electro-magnet, at the opposite clip, by the same movement of the arm.

Every controller upon the system thus cuts itself out automatically, by the simple movement of the pivoted arm 18.



FIGS 3 AND 4 MULTIPLE-RATE METERING —DIAGRAMS OF CONNECTIONS.

Second, the marked simplicity of construction, and arrangement of parts, by which liability to become disordered and tendency to depreciation are reduced to the minimum.

Third, the extremely brief period that current remains on the control circuit, this interval being measured by the time required after one magnet is energized, to enable the knife 20 to draw out of the clip which forms part of the circuit of that magnet.

Finally—and this feature is the most important of all—the control apparatus throughout the entire system is installed and operated electrically from a single point (the central station), without the trouble and expense of providing a wire, or wires, for the control circuit. This is a feature of no small advantage in any case, but where the mains are not laid in subways and where, as in the Edison system, the wires are piped, and buried beneath heavy block pavements or asphaltum, the labor and cost of laying a control circuit would be very great. Upon the lines of the company where the apparatus is installed, the mains are in conduits in which two disused pressure wires were found, each No. 16, B. & S. gauge, and partly as a matter of convenience one of these wires was used for the circuit, controlling a number of the earlier installations. With others, two circuit wires were connected, the object being to ascertain if there were advantages in one arrangement, as compared with the other. Repeated trials and continuous use, extending over a period of nearly six months, have shown that the accuracy of control and certainty of operation were the same.

Dispensing, therefore, with wires for the control circuit, the cost of installation is reduced to a point so low, that the addition to the fixed charges caused by the complete equipment of a system with the apparatus will be inconsiderable.

The controllers, which practically constitute the entire apparatus, are simple and inexpensive, and are connected and disconnected quickly, and with ease. Each controller takes from one fortieth to one-twentieth of an ampere for its complete operation. The small current and the high resistance of the electro-magnets, which are wound with No. 40 wire, and have 2,000 ohms resistance, or more, render an ordinary resistance, due to a poor ground connection, of no consequence.

The importance of improving the load factor, as the means of reducing the cost of generation, is well established. The necessity of effecting this is evident by the readiness with which many central stations have installed costly accumulators, which have been thought by some to afford a solution of this problem.

Accumulators are valuable, no doubt. They come to the rescue in the event of a break-down; they steady the load; they can supply a sudden large demand for current which happens during peak hours, and in other respects they are useful adjuncts of a central station. Moreover, they improve the load factor of the generating mechanism, but not the load factor of the feeders and mains.

The latter, which may constitute by far the largest part of the investment in systems of ordinary extent, are not affected economically by the presence, or absence, of accumulators. There are, however, objections to them. They are highly expensive; they suffer a loss in efficiency of 25 per cent.; they depreciate rapidly; they occupy much space in the plant; their upkeep is costly, and they require a large outlay of capital with respect to the output.

On the other hand, it has been shown repeatedly what is the advantage of increasing the hours of consumption, and thereby improving the load factor of the entire outfit.

It is only by offering effective inducements, which bring about a material extension of the hours of consumption, largely increase the adoption of electric energy for every purpose for which it can be adopted, and enable it to compete with gas and steam, under conditions of practical equality—thus only that the "hills and hollows of the load curve" can be smoothed out, and the actual cost of production reduced to a point that will remove the incentive for maintaining private plants, and the substitution of gas and incandescent burners in place of the electric light.

In an article by Prof. Marks, of recent publication, a tabulated statement was given, setting forth the results in a given case of increasing the hours of consumption. Among other points shown, it was stated that an incandescent lamp of 16 candle power burned two hours daily cost each year $2.10, and yielded an annual profit of $2.63. If the use be extended to 12 hours daily, the yearly cost would be $7.26, and the yearly profit $21.46. Here the improvement of the load factor, due to an extension of the hours of use from two hours to six times that number, multiplied the annual cost by 3.36 and the yearly profit by 8.16.

It is well understood that the standing charges may constitute at least 85 per cent. of the total annual expenses of a generating plant. The remaining 15 per cent., therefore, represents the yearly running expenses, fuel being in most cases the largest single item. A central station, therefore, can double its output without adding to its expense account more than another 15 per cent.

Prof. Thomson, in speaking of the problems that confront central station managers, says that improving the load diagram is apparently of [illegible] importance to them, than systems that would [illegible] or even treble the present [illegible] efficiency. [illegible] is meant the percentage of energy value of the [illegible] converted into electric energy. It is well known also, that the condition even arises when [illegible] load, which will improve the load factor [illegible] affecting the maximum load, would be [illegible] a rate less than cost, the profit being [illegible] increased efficiency of the whole outfit.

Central station men cannot be [illegible] plain indication for the future. The [illegible] of private plants, the increasing frequency [illegible] incandescent gas burners are [illegible]

lamps, and the readiness which many gas companies have shown in reducing their charges, all point to the conclusion that a reduction that will permit competition with gas and steam is the only condition upon which the general extension of the use of the electric current can be assured.

One result of the new method adopted has furnished in this connection a gratifying assurance of the benefits to be derived. A large mercantile house, in which lamps are burned all day, to light the basement, had substituted gas in place of the incandescent lamp. Since the introduction of the double-rate method, however, the gas lights have been removed and the electric lamps restored. Both changes were made in the interest of economy.

The duration of the hours of low rate will be fixed by the manager of the central station. The time at which this period begins will be regulated by the time at which the peak hours may be expected, and this will be, in a measure, influenced by the season of the year. For instance, in winter the high rate, or full rate period, may begin at 4 p. m., and continue until, perhaps, 11 or 12 p. m. In summer, when the evenings are shorter, the hour at which the full rate begins and ends will be varied in accordance with the time when the maximum demand upon the generating plant may be expected.

The controlling switch at the central station is placed upon the switchboard at a convenient point. At the hour fixed for the change from one rate to the other, an employe throws the switch-blade on the switchboard into the clips which form part of the circuit of the electro-magnet that is to operate the pivoted arm of the controller. The switch-blade need not remain in the clips more than one or two seconds, and in that time every pivoted arm of every controller on the system is withdrawn from the clips in which it [illegible] and thrown into the clips on the other side of the arm. This action, where two meters are used, opens the armature or shunt circuit of the meter by which one rate is registered, and closes the corresponding circuit of the other meter. Thus [illegible] to act at the moment when the latter begins.

If a single meter, only, is installed at each point of consumption, as shown in Fig. 4, the action of the controller is the same, but instead of the alternation last described, the throw of the pivoted arm of the controller simply inserts or cuts out a resistance in each meter circuit which varies the registering action to the required degree. The same result can be produced by causing the pivoted arm of each controller to shift the meter circuit from the two outside mains of a balanced system to one outside and the neutral. This varies the voltage in such manner as to produce a registering action of double the speed [illegible] with the other [illegible]

[illegible] accidentally [illegible] the [illegible], by which the controllers may be operated at the wrong time, a separate [illegible] mounted on the switchboard and connected in the same manner as the other[s] that are placed at the [illegible] points of consumption. Upon the [illegible] controller will be the first to operate and will attract the attention of the employe at the switchboard, who will, in such an event, operate the main switch and thus restore all the controllers to their proper positions. Means, however, have been provided by which this result can be accomplished automatically.

Power Development at Massena.

By Orrin E. Dunlap.

The water-power development on the St. Lawrence River at Montreal is not to stand alone as the single great development of that river, but it is to have a rival in a plant now being constructed at Massena, N. Y. Unlike the power installation near Montreal, the Massena plant has no large city close by to use the electric energy it is expected to make available, but on the contrary it is located in a section of country where possibly the important advantages to be offered in the way of power alone must act largely in developing a market for the power to be generated. It is well known that the possibility of obtaining really cheap and constant power acts as a great incentive to the building up of a locality, and the promoters of the Massena development have confidence in marketing their product, as is evidenced by the manner in which they are building.

Those who have seen and are familiar with the method of development employed by the Niagara Falls Hydraulic Power and Manufacturing company at Niagara Falls will recognize in the Massena project a slight similarity. In the Niagara plant the upper river is the head-race and the lower the tail-race, the water used for power purposes flowing from one to the other through a canal. In the Massena project the famous St. Lawrence River is to be the head-race and the Grass River, a small stream, is to be the tail-race. The distance across country from the St. Lawrence to the Grass River is about three miles, and this represents the length of the surface canal now being built. The contracts for this work and for the power house are in the hands of the Lehigh Construction company of South Bethlehem, Pa., which, it is understood, bears the same relation to the St. Lawrence Power company that the Cataract Construction company does to the Niagara Falls Power company. The line to be followed from the St. Lawrence to the Grass River is practically straight. The canal will be 225 feet wide and 25 feet deep. This will necessitate a vast amount of excavation, but the plateau between the two rivers is of material easily excavated, being of sand, clay and gravel. In order to facilitate the work Engineer John Rice of the Lehigh Construction company has designed a dirt conveyor which will no doubt be one of the most interesting features of the construction plant. This conveyor is shown in Fig. 1. In appearance it resembles a great derrick being 230 feet long, while its height is 60 feet. It is mounted on trucks which run on a temporary railway track laid on the bed of the canal. Buckets will traverse the entire length of the machine on an endless chain, and as fast as steam shovels can loosen the earth the buckets will pick it up and carry it to the other end of the [illegible] will be dumped well outside of th[e] [illegible].

FIG. 1. POWER DEVELOPMENT AT MASSENA.—VIEW OF CHANNEL LOOKING NORTH FROM POWER HOUSE, SHOWING CONVEYOR.

The map, Fig. 2, gives a good id[ea] [illegible] of the St. Lawrence and Grass rivers and the power canal to connect them. The head of the canal on the St. Lawrence is slightly below a promontory which it is expected will serve to deflect to the opposite shore all the drift and ice coming down the stream and which would be likely [illegible] the canal. At this point the St. Lawrence has in the Long Sault Rapids a fall of about 50 feet, and the Grass River, at the point where the power canal will discharge into it, is about 45 feet below the level of the St. Lawrence above the rapids. The canal will discharge the water onto the turbines at a head of about 40 feet, and after passing the turbines the water will return to the St. Lawrence by the Grass River. Thus the water used will be but a short time diverted from its original course. It will in no way interfere with navigation, as the channel from which it is taken is unnavigable. The river's navigable channel is on the Canadian side at this point. In its complete form the power house of the Massena plant, as shown in Fig. 3, will be between 500 and 600 feet long and 130 feet wide. This structure will stand on the rock bed of the Grass River, and the rock will be excavated in order to allow a free discharge of water from the wheels. The installation in this power station will differ from the installations with which the public is familiar in the other notable power houses of the country. The turbines will be of the vertical pattern mounted on a horizontal shaft. The generators will each be of 5,000 horse power capacity, and in all there will be 15 of them. It will require four turbines to operate each generator. The turbines to be used will be of the Victor type and made by the Stilwell-Bierce and Smith-Vaile company of Dayton, O. They are well adapted to obtaining great speed from a comparatively slow-moving body of water. The order for the generators has been placed with the Westinghouse Electric and Manufacturing company of Pittsburg. These generators will also be somewhat novel in construction and operation. They will be mounted on the same shafts with the turbines, but the distance between them will be about 80 feet. Each generator will weigh about 350,000 pounds, the weight of a single piece used in their construction being 125,000 pounds. Their outside diameter will be about 20 feet, and they will stand about 22 feet high over the foundation. Each generator will occupy a floor space of 22 by 18 feet. The speed at which they will run will be 180 revolutions per minute.

The contract for these generators was the largest ever made at one time for electrical apparatus, and it should be noted that their capacity is to be the same as the big generators in the station of the Niagara Falls Power company, while the number ordered is five more than will be placed in the power house extension of the same company. The generators of the St. Lawrence Power company will, however, be of different design and vary in many ways from the great Niagara generators.

The St. Lawrence Power company, it is stated, has English capital behind it. It was incorporated under the laws of New York with a capital of $2,000,000, which was later increased to $6,000,000. The officers are: President, Walter C. Lane; vice-president, S. H. Gardyne Stewart; secretary, Carlton H. Reeve; treasurer, William C. Cox.

Changes in the Patent Law.

On January 1st several amendments to the United States patent laws went into effect. One that has attracted considerable attention is the revision of the provision relating to published descriptions of inventions prior to the date of application for patent. The exact language of the law as it now stands is as follows:

"Any person who has invented or discovered any new and useful art, machine, manufacture or composition of matter, or any new and useful improvement thereof, not known or used by others in this country, before his invention or discovery thereof, and not patented or described in any printed publication in this or any foreign country for more than two years prior to his application, and not in public use or on sale in this country for more than two years prior to his application, may, upon payment of the fees required by law, and other due proceeding had, obtain a patent therefor."

This makes it imperative upon the inventor to apply for a patent within two years from the date of the printed description, if he expects to get a patent at all.

The new law also requires that persons who have made applications for foreign patents must, if seeking a United States patent on the same invention, file their applications at Washington within seven months from the date of the application for the foreign patent, instead of at any time during the life of the foreign patent, as heretofore. To anticipate this requirement there was an unprecedented rush of applications at the Patent Office during the closing days of the year. A Washington dispatch says that on December 28th the record was broken by 375 applications.

Elevators for Government Buildings.

The supervising architect of the Treasury Department at Washington received the following bids on January 3d for furnishing 10 freight elevators, two passenger elevators, one package elevator and one [illegible] lift for the United States appraiser's warehouse at New York:

Morse, Williams & Co., Philadelphia, electric, $68,500; steam, $78,658; time, 120 working days.

Otis Bros. & Co., New York, electric, $66,460; steam, $54,000; time, April 1, 1898.

Sprague Electric company, New York, electric, $50,000 time, April 1, 1898.

Standard Elevator and Manufacturing company, Chicago, electric, $50,000; steam, $57,400; time, April 1, 1898.

Telephone News from the Northwest.

[From the Minneapolis correspondent of the Western Electrician.]

Over 80 telephones have been subscribed for in Waseca, Minn. Arrangements are about completed for constructing the system.

The Wisconsin Telephone company announces a reduction in rates at Appleton, Wis.

The Home Telephone company of Oskaloosa, Iowa, has ordered a new switchboard with 400 drops. The exchange now has 353 subscribers.

A. Goetschius is an applicant for a telephone exchange at Marshfield, Wis.

The Farmers' Telegraph association of Bear Valley, near Dixon, Wis., has taken out the telegraph instruments and put in telephones. There is now a private line of 20 miles to towns where public lines connect with this system.

A project is on foot at Detroit, Minn., to extend a telephone line to White Earth, Minn., 22 miles. There is now no connection with the White Earth Indian Reservation.

The Iowa Telephone company will put in an exchange at Dyersville, Iowa.

A telephone line is about completed between Chariton, Iowa, and Columbia.

J. J. McGeehan of Ashland, Wis., has been granted contracts by the Wisconsin Valley Telephone company to build lines to Hurley and Ironwood, and to install exchanges in Chippewa Falls and Eau Claire.

The Northwestern Telephone Exchange company has about completed its work in Albert Lea, Minn., and its crew will at once work back to Minneapolis, stringing another set of wires.

The Iowa Telephone company has put in a new switchboard at Clinton, Iowa, with 300 drops. It is a multiple board and is said to be the first of the kind in the state.

The Rocky Mountain Bell Telephone company at Butte, Mont., finds an average of 5,172 calls every 24 hours, as compared with 3,853 for the same time a year ago. If business continues to increase as it has lately, Manager Miller states that two additional stories will be erected to the company's building.

The local telephone company at Willmar, Minn., will pay a gross earnings tax of $9.88. The members of the company were inclined to argue that as the law provides for companies doing business within the state, it could not apply to those doing business in a village, but decided to pay it when the amount was learned.

There is trouble brewing in the ranks of the directors of the Mutual Telephone company of Des Moines, Iowa. The faction represented by A. T. Hess is charged by the others with working in the interest of the Bell company. It is claimed that an attempt is being made to get control at the election of directors to manipulate affairs in favor of the Bell exchange. The Hess faction denies this, and says that its desire is to have the exchange run economically.

The telephone company operating a line between Le Sueur Center and Montgomery, Minn., has $200 in the treasury. It will use this to extend the line to Cleveland, Cordova, Heidelberg and St. Thomas.

The Mississippi Valley Telephone company of Keokuk, Iowa, has increased its number of subscribers in that city until it has the largest list in Keokuk.

The telephone exchange in Chippewa Falls, Wis., answered 35,000 calls in December, which is the record for the exchange. Manager Lamoreux says the exchange business is growing rapidly. The increase during the last three months has been greater than during any other entire year.

The attorney-general of Minnesota has handed down an opinion holding that telephone companies cannot be taxed on interstate business under the gross earnings tax law. The attorney-general holds that the law is defective.

Niagara Power Development.

Public interest in power matters on the Niagara border has of late been considerably stirred up by the agitation on the part of the people of Niagara Falls, Ont., for power, by the action of the New York State Reservation commissioners in taking steps to secure an international agreement for the protection of the falls, by the formation of the Canadian Niagara Power League, by the attitude of the Ontario government upon the subject of extending the time limit of the Canadian Niagara Power company, by the activity of promoters of other power projects in trying to discredit the good intentions of the Canadian Niagara Power company, and by various other causes which have had their effect on public opinion.

FIG 3 POWER DEVELOPMENT AT MASSENA.—PROPOSED POWER HOUSE FOR ST. LAWRENCE POWER COMPANY.

While it is quite true that to-day there is apparently little or no demand for electrical power at or near the Falls on the Canadian side, it is hard to foretell just what activity would be given to the industrial opportunities of the locality were all the power advantages of the spot made available for man's use, and it is therefore reasonable that the people living on the Canadian side should like to see the resources of their side of the river developed as well as their good neighbors' on the New York state side of the boundary stream which offers such exceptional power facilities.

The Canadian Niagara Power company holds an exclusive right for the development of power in Queen Victoria Park on the Canadian side. This franchise has the approval of the Ontario government and the park commissioners. Conflict has arisen over the fact that the Dominion government granted a franchise to the Canadian Power company allowing it to discharge the tail-race of its proposed development through the park lands into the river, the Ontario government, the park commission and the Canadian Niagara Power company holding this to be a violation of the latter company's rights; and the efforts of the Canadian Power company to secure recognition have been fruitless.

A. C. Denniston, who represents the Canadian Power company, has made a strenuous effort to bring about a power development in Canada in conjunction with the Canadian Niagara Power company, controlled by the Cataract Construction company, but these efforts have been entirely fruitless; and he ascribes this failure to the fact that the Cataract Construction company has no present intention of making any substantial power development in Canada. Mr. Denniston has prepared a statement in which he appeals to the Canadian prejudice against American enterprises. He says:

> The delay in the development of the Canadian power is building up the American side of the river at the expense of the Canadian. Should the American company be allowed to maintain the monopoly claimed by it of Niagara power in Canada, not only will the development of Niagara power in Canada be still further delayed, but this power when developed will be but an annex to the great American plant. The American company can certainly not afford to underbid itself in Canada. Its investment on the American side now reaches $6,000,000, and it cannot prejudice the future productiveness of this investment by setting up a rival to itself in Canada.
>
> The opposition of the Cataract Construction to the plans of the Canadian Power company has been based solely upon a forced and unwarrantable construction of the very plain terms of its agreement with the park commissioners. A monopolistic privilege can never be stretched beyond its plain intent, and there is nothing in the agreement of the park commissioners to prevent their giving to the Canadian Power company the permission asked, merely to discharge across or under the park the waters of its canal to be constructed from the Welland river.
>
> The present plan seems to be to bring about in conjunction with the Park and River railway a small and unimportant development, meeting in this way some obligations incurred of supplying power, and, having the matter entirely in its own hands, fix the cost of power to suit itself, and so manipulate matters as to give an apparent warrant for the claim that no substantial development of power is demanded in Canada. Upon this point let me say in passing that the applications for power made to us established the fact beyond any doubt whatever that a large and important development is at once demanded on the Canadian side of the river.

Following the publication of this letter a public meeting was held in Niagara Falls, Ont., under the auspices of the Canadian Niagara Power League, at which William B. Rankine, secretary of the Canadian Niagara Power company, made an address. He said that many obstacles had been found in the way of the Niagara Falls Power company, and that naturally no work could be done on the Canadian side of the river until the problems had been solved. He added that it was the intention of the Niagara Falls Power company, when the Canadian plant was constructed, to work both the Canadian and American plants in conjunction, thus securing to all customers a constant power supply. If a break-down is experienced on the American side the customers will be switched onto the Canadian plant, and if trouble is met with on that side the Canadian customers will be thrown on the American plant.

One of the most interesting statements made by Mr. Rankine was that three months before the expiration of the time limit on the Canadian agreement, it was discovered that the walls of the wheel pit on the American side were gradually coming together. About half-way down the pit the rock was beginning to creep, as geologists term the action, and a new and exceedingly dangerous situation confronted the company. All plans were upset and nothing was thought of save a remedy for this impending disaster which threatened to put an end to the future operations of the company. The experience of eminent engineers was called into service to ascertain the cause of the creeping of the rock. All was done that could be to stay the work of destruction, when the creeping ceased, on August 15th, almost as suddenly as it began, but the delay and anxiety had caused the company to allow the time limit on the Canadian side to lapse, and another extension of time was asked for. He announced that all difficulties have now been practically surmounted, and the company will soon be in position to make a proposition that will satisfy the claimings for power on the Canadian side. Propositions are being received for long-distance transmission to Toronto, and this matter must be settled before power will be developed, for all admit that there is not sufficient demand in the vicinity of Niagara Falls, Ont., to warrant the erection of an expensive plant.

At the close of the meeting the following resolution was adopted: "It is the opinion of this meeting that it is in the public interest that there should be more than one power development at Niagara Falls, Ont."

Frank P. Crocker has made application to the council of Hammond, Wis., for a franchise for electric lighting.

Every central-station manager is interested in the methods in vogue of charging for current, and any innovations that may be proposed will receive careful attention. At the last meeting of the National Electric Light association this subject formed the principal topic of discussion, and later at the Edison convention similar problems were considered. Mr. Eustace Oxley has prepared an article on this subject which is presented on another page this week. The method of controlling the meter upon a distributing system, as described in the article, has been adopted by the United States Electric Lighting company of Washington, which installed it at a number of points upon the company's lines on July 6th. The success of the method has been very gratifying, and the beneficial results are believed to justify the publication of the description of the method and apparatus employed.

Much interest is manifested among electrical men in the West, particularly in Chicago, in the forthcoming convention of the National Electric Light association. It is pretty generally understood that there will not be a general exhibition of electrical machinery and supplies in connection with the convention, but it is probable that there will be many individual exhibits at the headquarters of the several companies. On President Insull's return from Europe it is understood that he will appoint the committees to which will be assigned the work of preparation for the meeting and the entertainment of visitors during the convention. He has already formulated a general plan for the meeting, but the details had not been sufficiently worked out before his departure to permit of publication. The sentiment of the members seems to be in favor of making the Chicago meeting the largest gathering of central-station men that has ever been assembled in the country.

The policy of the administration of Greater New York toward the rapid transit plans is indicated by the first message of Mayor Van Wyck, and certainly cannot be construed as favorable to the underground project. The people of Greater New York need not look to Tammany for assistance in securing rapid transit at the expense of existing interests. Mayor Van Wyck expresses fears lest the credit of the city might be affected by the obligations it would incur in building the underground road. He urges improvement in the "L" service, however, and recommends the adoption of electricity upon these lines. He says: "To my mind there can now be urged no sufficient reason for the continued employment of the locomotives now in use on the elevated roads, and the people should no longer be subjected to the resulting nuisances of noise, smoke, and flying cinders. You should demand and insist upon the substitution, in the place of the present motive power, of electricity, which can now be safely utilized in the operation of these roads, affording a more cleanly and less noisy service, and that, too, with an improvement in speed." He urges, also, extensions and improvements on the present lines and the running of express trains day and night. The surface roads, it is also pointed out, should be compelled to improve their service.

Heretofore inventors have been permitted to make application for patent protection whenever convenient without regard to the issuance of foreign patents, but under the law which went into effect January 1st an important change takes place. The new law inhibits the patenting of any invention which has been patented or described in any printed publication in this or any other country more than two years prior to the application. No patent shall be refused nor shall any patent be declared invalid by reason of its having been patented first in a foreign country unless the application was filed more than seven months prior to the application in this country. Under penalty of being regarded as abandoned, the application must be completed and prepared for examination within a year after filing. An interference will not be declared between an original application and a patent issued more than two years prior to the date of filing the application. It should be borne in mind also that the term of the United States patent will not be shortened by the prior filing or issue of a foreign patent for the same invention. It is possible, therefore, for the American inventor now to proceed with foreign applications without waiting for his United States patent to be issued. The new law is practically the same as that existing in England.

A Washington correspondent says that just before the new law went into effect, at the beginning of the new year, the rush of belated applications was so great as almost to cause a congestion in the work of the Patent Office. That department will be badly crippled for a time unless additional help is provided.

Charles G. Armstrong, in a recent article, notes the interesting fact that the inclosed arc lamp was seemingly anticipated in Jules Verne's "Twenty Thousand Leagues Under the Sea"—a book which also foreshadowed the submarine boat and other modern actualities. As quoted by Mr. Armstrong, the French writer mentioned that "that wonderful ship was lighted by an arc lamp. The electric lamp was combined in such a way as to give its most powerful light—indeed, it was produced in vacuo, which insures both its steadiness and intensity. This vacuum economized the graphite [carbon] points, between which the luminous arc was developed—an important point of economy," etc. * * * "Under these conditions the waste [the carbon] was imperceptible." Mr. Armstrong comments as follows: "Had he said their waste was very gradual he would have exactly portrayed the present operating condition of the inclosed arc lamp. While there is no evidence that he knew anything about electricity, he certainly made a fair guess as to what would be a good commercial article in 1897. If he were to ape the methods of some of our prominent electrical inventors he would undoubtedly come forward at this time and claim priority of invention."

It is fair to remark that Mr. Armstrong seems to underrate M. Verne's scientific attainments, as all the contemporaries and intimates of that entertaining story-teller agree that he kept fully abreast of the scientific thought of the day, which his capacity and tastes permitted him to thoroughly assimilate. His art consisted in the adroit manner in which he used his scientific knowledge to give verisimiltude to his daring flights of imagination. Yet the fact that in several cases his fancied creations have been to some extent realized in fact seems to show that he is entitled to a greater recognition than that of a happy guesser.

On another page is printed the text of the ordinance now pending in the Chicago City Council which has for its object the creation of a Department of Electricity in the city government. It will be read with interest, especially by the electrical men of Chicago, who are primarily affected. The greater part of it relates to electrical inspection, and the duties of the department are briefly set forth. As will be seen, while the electrical interests of the city government are directly placed in the charge of the proposed department, supervision will also be had over all electrical installations, public and private, in Chicago.

If the ordinance secures the votes of the necessary number of the aldermen, there is little doubt that the mayor will sign it, and it is further expected that he will appoint as the first head of the new department Edward B. Ellicott, the present superintendent of city telegraphs and the city electrician de facto if not de jure. If the ordinance fails to become a law, then it would seem that under the civil-service law, as recently interpreted by the Supreme Court, the position of Mr. Ellicott, as the head of a bureau, is one that must be filled from a list of eligible candidates furnished by the civil-service commissioners, after competitive examination.

Whatever disposition is made of the matter, the Western Electrician desires to express its conviction that Mr. Ellicott, in discharging the duties of city electrician for the last six months, has given the city good service. He has worked hard, and we believe he has conducted the office without favoritism. His record is almost too short to judge, but it seems altogether promising, and we are persuaded that he is entitled to the commendation of the people, whom he serves. It will be a pity if the position of this useful public servant is jeoparded by a law intended for the improvement of the public service.

A Department of Electricity Proposed for Chicago.

An ordinance creating a municipal Department of Electricity is pending in the Chicago City Council. It has been referred to the committee on judiciary, of which Alderman Walker is chairman. The full text of the ordinance is as follows:

An Ordinance Providing for a Department of Electricity.

Be it ordained by the City Council of the city of Chicago:

Section 1. That paragraphs 589 to 598 inclusive of Chapter XXV. and paragraphs 623 to 628 inclusive of Chapter XXVI. of the "Revised Code of Chicago, 1897," be and the same are hereby repealed.

Sec. 2. That in lieu thereof the following ordinance is hereby enacted and numbered by paragraphs as follows, and designated as a part of Chapter XXV. of the "Revised Code of Chicago, 1897," viz.:

Chapter XXV.—Department of Electricity.

589. Department Created.—There is hereby established an executive department of the municipal government of the city of Chicago, which shall be known as the Department of Electricity, which shall include a city electrician, an assistant city electrician, a superintendent of construction, a chief clerk, two bookkeepers, two stenographers, one chief inspector and nine assistant inspectors, and such other assistants and employes as the City Council may by ordinance establish.

590. City Electrician.—There is hereby created the office of city electrician, who shall be the head of said department of electricity, who shall be a practical and skilled electrician, and who shall not be engaged in any other business while acting in said capacity. He shall hold his office for the term of two years and until his successor shall be appointed and qualified. He shall be appointed by the mayor, by and with the advice and consent of the City Council, whenever a vacancy exists in said office by removal or otherwise.

591. Bond—Approval of.—Said city electrician, before entering upon the duties of his office, shall execute a bond to the city of Chicago in the sum of $20,000, with such sureties as the City Council shall approve, conditioned for the faithful performance of the duties of his office.

592. Powers—Subordinate Officers—Bonds—Salary.—He shall have the management and control of the fire-alarm telegraph and police telephone system, of all municipal electric lighting, of the inspection of all electric wiring within the city limits, both inside of buildings and above, beneath and upon the surface of the streets, and of all electrical matters in which the city is interested, and shall appoint, by and with the consent of the mayor, and in accordance with law, all subordinate officers and assistants named herein and that may hereafter be provided for, and may remove them for inefficiency or neglect of duty in accordance with law. All subordinate officers, assistants, clerks and employes in said department shall be subject to such rules and regulations as shall be prescribed from time to time by said city electrician. Said city electrician shall require good and sufficient bonds to be given by all subordinate officers and employes in said department who shall receive, or have the care, custody or handling of any money belonging to the city of Chicago, and said bonds shall be approved by the mayor and comptroller. The salary of the said city electrician shall be the sum of $4,000 per annum.

593. Assistant City Electrician—Qualifications—Duty—Salary.—There shall be appointed an assistant city electrician, who shall be a practical and skilled electrician, and who shall act as city electrician in case of the absence of the city electrician from his office, and, while so acting, shall discharge all the duties and possess all the powers invested in and imposed upon the city electrician. The salary of the assistant city electrician shall be the sum of $3,250 per annum.

594. Superintendent of Construction—Powers—Duty.—There shall be appointed a superintendent of construction, whose duty it shall be to put in new circuits and install all new work of the city under the direction of the city electrician. His salary shall be the sum of $1,800 per annum.

595. Other Officers—Powers—Duties—Salaries.—There shall be appointed the several officers and employes of the department named in paragraph 589 hereof, whose appointment is not hereinbefore provided for, and the powers, duties and salaries of such officers and employes shall be such as may be required and prescribed by the city electrician, the rules and regulations of this department and the ordinances of the city.

596. Electric Current.—No electric current shall be used for illumination, decoration, power or heating, except as hereinafter provided.

597. Application—Contents—Permits.—All persons, firms or corporations desiring to make use of electric currents for any of the purposes mentioned in the preceding paragraph of this chapter, shall, before commencing or doing any electrical construction work of any kind whatever, either installing new electrical apparatus or repairing apparatus already in use, file an application for a permit therefor in the office of the city electrician, which application shall describe in detail such material and apparatus as it is desired to use, with a full description of the same, giving the locality by street and number; and upon receipt of which application, if found proper, such permit shall be given.

598. Duties of City Electrician Thereon.—The said city electrician shall then have power, and it shall be his duty, when by him deemed necessary, to carefully inspect any such installation previous to and after its completion, and it shall be competent for him to remove any existing obstructions which may prevent a perfect inspection of the current-carrying conductors, such as laths, plastering, boarding or partitions; and if such installation shall prove to have been constructed in accordance with the rules and requirements of the Fire Department of the city of Chicago, controlling the use of electric current upon the payment of a fee, as herein provided, he shall issue a certificate of such inspection, which shall contain a general description of the installation and the date of said inspection. The use of electric current is hereby declared to be unlawful previous to the issuance of said certificate; provided, however, the city electrician may issue a temporary permit for the use of electrical current during the course of construction or altering of buildings, which permit shall expire when the electrical apparatus for such building is fully installed.

598a. Preliminary and Final Certificate.—A preliminary certificate may be issued by said city electrician in the case of completed installation, but upon which no current will be used in the immediate future. Such preliminary certificate shall show that at the date of inspection the installation was erected in accordance with the terms of this chapter, and shall be issued at one-half the rates hereinafter named. Prior to the introduction of electric current into the said premises a second inspection shall be made, when, if the said installation is still in accordance with the terms of this chapter, a complete and final certificate shall issue, and the amount of the fee paid for the preliminary certificate shall be deducted from the fee for the final certificate. Any owner or owners of property installing electric wires to be hidden from view shall, prior to such installation, give said city electrician a reasonable notice in order to give ample time for inspection.

598b. Power of City Electrician—Penalty.—The said city electrician is hereby empowered to inspect or reinspect all overhead, underground and interior wires and apparatus conducting electric current for light, heat or power, and when said conductors or apparatus are found to be unsafe to life or property, shall notify the persons, firms or corporations owning, using or operating them to place the same in a safe and secure condition within 48 hours. Any person, firm or corporation failing or refusing to repair, change or remove the same within 48 hours after the receipt of such notice, shall be subject to a penalty of $10 for each and every day such conductors and apparatus continue to be in an unsafe condition.

598c. Poles — Covers — Wires — Branded and Tagged.—All poles now standing or hereafter erected, and all covers for manholes now in service or hereafter placed in service for the use of electric conductors, shall be branded or stamped with the name of the person, firm or corporation owning the same; and all electric service entrances shall have attached to the conductor or conductors, in a conspicuous place, a substantial tag designating the owner of, and giving such a full description of the conductors as shall meet with the approval of said city electrician.

598d. Fees.—There shall be collected by the said city electrician and paid into the treasury of the city of Chicago, upon the issuance of certificates permitting the use of electric currents, the following fees:

For each arc light, the sum of............	$1.00
For each incandescent lamp of nominal 16 candle power, and for larger or smaller lamps in that proportion..............	.10
For each electrical horse power of 746 watts, used for mechanical or other purposes than above mentioned.	1.00
But no inspection shall be made for a less amount than..................	1.00
Inspection of temporary installation for show windows, exhibitions, conventions and the like shall be charged for by the time required for such inspection, at the rate of, per hour.....................	.50

For each re-inspection of any overhead, underground and interior wires or apparatus, there shall be collected by said city electrician at the rate of one-half of the fees prescribed in this paragraph.

598e. Record—Annual Report. It shall be the duty of the said city electrician to keep records containing a full and accurate account of all inspections made, and of all moneys received, and render a full report and account to the comptroller of the city of Chicago, on the 31st day of December in each year.

598f. Alterations.—No alterations shall be made in any installation without first notifying the said city electrician and submitting the same for similar inspection as above provided.

598g. Penalty.—Any person or persons who shall use any electric current in violation of any of the provisions of this chapter, shall be subject to a penalty of not less than $50, nor more than $100, and to a further penalty of $10 for each day during which he or they shall continue such violation. Said city electrician may, for any violation of this chapter, order and compel the cutting off and stopping such current until the provisions of this chapter are fully complied with.

Sec. 3. This ordinance shall take effect and be in force from and after its passage, and all ordinances or parts of ordinances in conflict herewith are hereby repealed.

Electrical Development in South Africa.

An increasing use is being made of electrical machinery in South Africa, as shown by the following array of news items, and the United States appears to be getting a share of the business.

The Harbor Board of Table Bay, Cape Colony, is considering the purchase of two electric cranes for the service of the port at Cape Town.

The borough engineer at Durban has recommended additions to the electric plant recently installed in that city, and it is probable that further orders for electric lighting will be called for by the Durban Town Council.

The General Electric company of New York has supplied the electrical equipment for the De Beers mine. It includes three tandem-compound engines of 175 horse power each, two 50 kilowatt six-pole compound dynamos of 220 volts and 115 volts respectively, a large switchboard furnished with voltmeters and ammeters, and 12,000 feet of large copper cable. The General Electric company also furnished two 165 horse power generators and a fine switchboard for the Witwatersrand (Knight's) mine.

The electrical pumping plant furnished to the Knight Central mine is also from America. It includes a 550-volt generator. The Goulds Manufacturing company supplied the equipment. The pumps are 4½ by 8 inches dimensions; they are of American pattern, each of a capaciy of 35,000 gallons per hour, and are arranged in pairs to minimize delay in case of accident.

The pumping plant ordered for the Witwatersrand deep mine is also from the Goulds company. It consists of four Gould triplex pumps, installed in pairs at each station, the former 6½ by 8 inches, and the latter 4½ by 8 inches, and of 4,800 and 3,600 gallons capacity, respectively.

Several good orders have been sent to England in connection with the installations of electric lighting plants, which are progressing as rapidly as possible under the circumstances. Orders for telegraphic and telephonic materials, too, have been sent to England within the last two months.

Street Railway Litigation.

According to the Economist, the Chicago General Railway company entered the first condemnation case under the Allen bill, for the purpose of connecting the line on Throop and Morgan streets. It also carried to the Supreme Court of this state as plaintiff in error against the city of Chicago its action respecting the unconstitutionality of the custom of the city of collecting annual revenues by alleged contract, a case which attained widespread attention, as it applied to street railways in all large cities in the country. Steps have been taken preparatory to placing the road under the operation of the interstate commerce law. A very full statement was prepared with reference to the legal status of the new issue of bonds made during the year, comprising the several acts taken by the company prior to their issue, the property which they cover, and such other information as would be of value to an investor. These bonds bear five per cent. interest, are in denominations of $500 and $1,000 each, and are due in 1935. It is explained that these bonds were issued on account of the important extensions made, including lines to the Drainage Canal, Union Stock Yards, running through a populous section of Lawndale, and an extension of the main line to Wabash avenue. The business of the road was more than doubled by these extensions.

Electrical Legislation in Virginia.

Among the bills of an electrical nature that have been introduced in the present Virginia Legislature are the following:

By A. Maupin of Richmond: To require telephone companies to pay a tax of one per cent. per annum on their gross receipts, instead of $1.50 on each transmitter, as at present.

By T. D. Jennings of Lynchburg: Providing for the incorporation of the Virginia Electrical Railway and Development company.

By Mr. Saunders of Franklin: To define and declare what shall constitute a telegraph, telephone or express company, and to provide a method for the determination of the value of its property within the state for the purposes of taxation.

By Mr. Cooke of Norfolk: To incorporate the Norfolk Bicycle Road company.

Fear Acetylene Gas.

The Jersey City fire commissioners have ordered a special investigation to determine whether the use of acetylene gas shall be permitted in dwelling houses, factories and business places in the city. In his search for places where the gas [illegible] the fire marshal discovered two kinds of acetylene. One is the liquefied gas which was [illegible] the United States Liquefied Acetylene [illegible]

company, whose works were blown up; the other is brought from Niagara Falls in hermetically sealed cans, and used for illuminating purposes in gas machines. Until the fire board acts the use of gas machines will not be permitted.

Ocean Cables in War Times.[1]

By Alexander Porter Morse

Eleven submarine cables traverse the Atlantic between 60 and 40 degrees north latitude. Eleven of these connect the Canadian provinces and the United States with the territory of Great Britain; two (one American, the other Anglo-American) connect France. Of these seven are largely owned, operated or controlled by American capital, while all the others are under English control and management. There is but one direct submarine cable connecting the territory of the United States with the continent of Europe, and that is the cable owned and operated by the Compagnie Français Cables Telegraphiques, whose termini are Brest, France, and Cape Cod, on the coast of Massachusetts. All these cables between 60 and 40 degrees north latitude, which unite the United States with Europe, except the French cable, are under American or English control, and have their termini in the territory of Great Britain or the United States. In the event of war between these countries, unless restrained by conventional act, all these cables might be cut or subjected to exclusive censorship on the part of each of the belligerent states. Across the South Atlantic there are three cables, one American and two English, whose termini are Pernambuco, Brazil, and St. Louis, Africa, and near Lisbon, Portugal, with connecting English lines to England, one directly traversing the high seas between Lisbon and English territory, and one touching at Vigo, Spain, at which point a German cable company has recently made a connection. The multiplication under English control of submarine cables has been the consistent policy of Great Britain, and to-day her cable communications connect the home government with all her colonies and with every strategic point, thus giving her exceptional advantages for commercial as well as for political purposes. The schedule blanks of rates of the English companies contain the following provisions: "The dispatches of the Imperial government shall have priority when demanded. The cable must not, at any station, employ foreigners, and the lines must not pass through any office or be subject to the control of any foreign government. In the event of war, the government [of Great Britain] may occupy all the stations on English territory or under the protection of Great Britain, and it may use the cable by means of its own employes."

It is not a pleasing reflection that in the actual situation the United States is at a great and embarrassing disadvantage. Meanwhile it would seem to be the policy of the United States to overcome this disadvantage by the multiplication of submarine cables under American or other than English competing foreign ownership and control.

Although somewhat indeterminate, the policy of the United States in respect to the landing of foreign submarine cables, so far, at least, as the executive branch of the government is concerned, appears to be based chiefly upon considerations that shall guard against consolidation or amalgamation with with other cable lines, while insisting upon reciprocal accommodations for American corporations and companies in foreign territory. The authority of the executive branch of the government to grant permission is exercised only in the absence of legislation by Congress regulating the subject, and concessions of the privileges heretofore have been subject to such further action by Congress in the matter as it may at any time take. Several bills are now pending in Congress relating to the landing of foreign submarine telegraph cables within the United States, and regulating the establishment of submarine telegraphic cable lines or systems in the United States. As this article is going to press, it is reported that the president has refused permission to a foreign cable company to renew a cable terminus within the territory of the United States, and that the question raised as to the power of the federal government to deny admission to the cable will be referred to the attorney-general for an opinion. Meanwhile, the executive branch of the government holds to the doctrine that, in the absence of legislation by Congress, control of the landing and operation of foreign cables rests with the president. The question of the landing of foreign cables [illegible] consideration from the late [illegible] in connection with an injunction suit brought by the United States against certain corporations engaged in placing on the coast of New York a cable having foreign connection. And he suggested for the consideration of Congress whether it would not be wise to give authority to some executive officer to grant or withhold consent to the [illegible] of such foreign enterprises [illegible] such terms and conditions as may [illegible].

The principal and most important submarine cables traversing or [illegible] are owned and operated by private [illegible] companies. They are in number [illegible] and their length in nautical miles is 130,7[illegible]. The length of cables owned or operated by state governments is, in nautical miles, 18,132.

The policies of states, the movement of fleets and armies, and the regulation of the markets of the commercial world, depend upon devices, communications and orders that are habitually transmitted through the agency of submarine cables. In this view, the first aim is to safeguard from wanton destruction the delicate and expensive mechanism of these cables; the second is to restrain within the narrowest limits practicable interruptions in the operation of cables, even in the midst of hostilities; and the third is to encourage the establishment and extension of submarine cables owned and operated by American capital. All these ends may be advanced by the agreement of the powers to neutralize absolutely the submarine cable systems of the world.

1. From the Albany Law Journal.

Ownership of Submarine Cables.

[From the New York Sun.]

There are, in all the world, 1,000 submarine cables owned by governments besides those owned by individuals and corporations, and they have a length of 20,000 miles. Every important country in the world, and nearly every minor country as well, has some such national cable—except the United States. Norway owns 264 cables; England, 246, including the Indian cables; France, 54, with a length of 5,000 miles; Germany, 54; Austria, 35; Greece, 47; Denmark, 60; Spain, 15; Turkey, 23; Japan, 34; Russia, 9; Sweden, 14; Italy, 39; Holand, 20, and Belgium 2. The explanation of this national ownership in cables, to which the United States is the only conspicuous exception, is found in the fact that in most foreign countries control of the telegraph service is under control of the government, and that the cables may be needed for war purposes.

In addition to the cables owned by governments, there are about 300 owned by corporations, with an aggregate length of 150,000 miles. The longest of these is the cable between China and Australia. The cable between Egypt and British India is another of the very long ones, and still another is the Brazilian cable between Lisbon and Pernambuco. Not one of the North Atlantic cables can compete with these in length. The French cable from Brest to Cape Cod, with a branch to St. Pierre, is 3,000 miles long. The Commercial cable from Waterville, Ireland, to Nova Scotia, is nearly 3,000 miles and the Anglo-American cable from Penzance to Nova Scotia is about 2,600 miles long. Cables owned by corporations pay better as a rule than those under direct or quasi-government control. The Atlantic telegraph cable was successfully laid in 1866, and the length of the original cable was 1,866 miles. The Great Eastern, which laid it, made no higher run than 128 miles a day and no lower run than 105. Fifteen days were spent in the work.

"Reasonable Compensation."

[From the Chicago Inter Ocean.]

Of all the corporations in the enjoyment of special privileges of valuable franchises in this city, the street railway companies are best able to exhibit direct proofs of the benefits they have bestowed upon the public in return for favors received.

While the steam railway companies, the gas companies, the electric lighting companies, the telegraph companies and the telephone companies have all contributed to the upbuilding of Chicago, the business they have enjoyed has been developed for them, to a great extent, by the street railway companies, which have not been content to serve the populous and profitable districts of the city alone, but have gone forward in their work of opening up new territory and peopling it, though profits from such extensions may not be counted upon for many years to come. The steam railway companies, the gas companies, the electric lighting companies, the telegraph companies, the telephone companies, the express, and all other companies, as well as the real estate owners and agents, the shopkeepers and tradesmen of this city, are benefitted by every mile of new car tracks laid through new territory by the street railway companies. The public treasury should gain in revenue annually in proportion to the benefits derived by corporations and property owners, if taxes were equitably levied and collected.

Demand for "Canned Electricity."

A Chicago concern received an interesting letter from a country customer recently upon the subject of "canned electricity," which the Western Electrician is permitted to reproduce, omitting, for obvious reasons, everything that might lead to the identity of the persons between whom the communication passed. Following is the text of the document.

[illegible]

Niagara Power in Buffalo.[1]

By Horatio A. Foster.

I will try to present to you in a concise form what has been done up to date to place the power in condition for your use.

To say nothing about the long line of overhead conductors between the power house at Niagara Falls and the cable terminal house at Black Rock, together with underground conduit and cable leading up to the transformer house in the rear of the Buffalo street railway power house, there have been laid a large amount, something over 100 miles, of conduit on Main, Niagara and Ohio streets. A transformer house has been built on Ohio street for the distribution of current in the region which includes the island and all its elevators and other enterprises and the large manufacturing district in the immediate neighborhood. Another distribution point will be at 40 Court street, the present station of the Buffalo General Electric company, and other distributing stations will be provided as fast as the demand in different regions calls for power sufficient to warrant their installation.

Inquiry is often made as to how the power will be distributed about the city, as to whether the distribution will be made by alternating currents of high pressure or low pressure or by continuous currents and methods similar to those in use in other communities. Although it may seem to those not directly connected with the engineering part of the project that such a decision might be arrived at without much trouble, it is a fact that until it is known what amounts and in what units the power will be demanded it is not possible to make a positive decision as to just which method or whether any one method will be chosen.

As far as the engineers have been able to decide it is more than likely that the alternating current at a moderate pressure will be used for large powers and a continuous current of about 500 or 550 volts will be used for the distribution of power in units of, say, 75 horse power and less. Perhaps to the layman it might seem best to decide on one method and stick to it, but when one becomes acquainted with the great elasticity of alternating currents and the use of the motors developed for connection to such circuits the more value there would seem to be in combining the two methods.

As an example of the alternating current I would instance the application of the induction motors now used at the Great Northern elevator and the Electric grain elevator, both of which places, as you know, might be made dangerous if there were any source of or possibility of sparks or flame from any part of the machinery, and the motors installed in both of these places are of such construction that it is absolutely impossible for a flame or a spark to be developed from the machine unless so much neglected as to be of no use. It is unnecessary for me to make any comparison of these motors with those in use on continuous-current circuits, as you are doubtless, most of you, familiar with them, and they are somewhat cheaper and easier of application to ordinary work.

In order to demonstrate some of the benefits that are likely to arise from a use of electric power at low cost, I will call your attention briefly to some of the methods now most commonly pursued in applying mechanical power. In the city of Buffalo the source of power is, of course, the steam engine, or in some isolated cases the gas engine, the application of power from either being the same. First, we have the main belt from the flywheel of the engine to a jack-shaft or main shaft, this shaft extending for a distance sufficient to allow belting to line shafts in various directions, but always parallel to or at right angles to the original main line. From these line shafts various small counter-shafts are run by belting, and at last the power is applied directly to the machinery by belting from the smaller or counter-shafts. Now, you well know that the line of shaft, together with the main belt from the engine, all the bearings on the shaft, all the belts to line shafting, the bearings of the same, all the belting to counter-shafting and the bearings on the same, require power, and this power is running to waste all the time, whether the machinery is in use or not.

Many investigations of the amount and percentage of this waste power have been made during the last 10 years, and all authorities seem to agree that 30 to 80 per cent. of all power so developed goes to waste in friction losses in running belting and shafting, so that when we get to the machinery itself but from 70 down to as low as 20 per cent. of the original power is available for use. It is therefore easy to understand that if but a fraction of this power can be saved for use a very considerable gain may be made; and this fact always should be given serious consideration when discussing the application of electricity to manufacturing purposes. It is fair to estimate that the average loss between the engine and machines using power will exceed 50 per cent. of the power developed, and this would seem to furnish a good margin, even at the same price, to warrant a manufacturer in adopting electric power.

In the matter of convenience of application, handiness in use, enabling more work to be gotten out of machinery with the same amount of applied

1. Read before the Real Estate Exchange, Buffalo, N. Y., December 29, 1897.

power, I only need to say that in cities where there has been a more general adoption of electric power, as in Boston, New York and Chicago, it is the exception to find any other form of power given any consideration. As a modern instance I will call attention to the American Lithographing company in New York city, which has equipped every machine on all the floors of its great building with electric motors in a way which makes perhaps the best sample of the kind in present use.

Another point which I am sure will be of special interest to all Buffalonians is the matter of cleanliness. I am sure that every Buffalonian will welcome the day when he can stand on the top of some high building downtown and in no direction find black smoke pouring in volumes from chimneys of manufactories and other buildings; and if the smoke outside is practically removed and motors are applied to the machinery inside the buildings without the intervention of so many pulleys and so much belting, we shall be able to see clean ceilings and walls and windows, cleaner machinery and probably cleaner help and a far superior grade of work produced.

You doubtless will understand that no project of the magnitude which this promises would be gone into by any association of capitalists without a most thorough investigation into the probable results; and in this line it was necessary for them to know the conditions as to use and cost of power as now existing in Buffalo and such other communities as might come within the range of its operation. For this purpose extensive researches were made into authorities and papers that had previously been made up on the subject of cost of mechanical power and its application, and on its own account the company instigated examinations and investigations into the actual cost of power, its method of application and the probable saving by the substitution of cheap electric power in Buffalo and other places. The results of these original investigations, while differing from those of others in that a greater variety of applications and a greater variety in amounts of power used came under the notice of the investigator, have proved two or three things that, while probably known to engineers and others in interest, have been brought more forcibly to their notice: First, that few users of power know anything about its unit cost, and few even have taken the care to determine the total cost of power as used in their own business, to say nothing about the average or even maximum amount in actual use. A second fact determined from these investigations was that no estimate of the cost of power for any industry is of any use whatever in estimating the cost of power for any other industry, and not only this, but in plants of precisely the same nature and business the variation in cost of power will often reach as high as 50 per cent., and it is therefore hardly fair in talking cost of power for any one plant to quote that of any other plant whatever. Quotations of the cost of steam power per horse power per annum are often made by a person in one community to one in another, without regarding the fact that coal is liable to vary in price $2 or $3 a ton as between the two places.

To be more specific, the cost of power in Buffalo has been found to vary from less than $20 a horse power for 10 hours a day in a factory producing its own fuel and needing but little labor on the plant to over $160 per annum per horse power for nine hours a day in another plant using a small amount of power. In one industry in which four plants were tested the lowest cost was in the neighborhood of $100 and the highest about $160; in another industry in which three plants were tested, the lowest was about $60, the highest over $200. In another industry, in which two plants were tested, and in which power is used in large amounts, very steadily, and for 24 hours a day, the variation in cost exceeded 50 per cent. The above results seem to indicate that the cost of power has not been such a small item nor so simple to estimate as may have previously been supposed, and I am strongly of the opinion that it will well pay nearly every user of mechanical power to make a thorough investigation into the cost of that which he is using, and after having done so to investigate the application and cost of Niagara power to his own purpose, and I shall then be very much surprised if he does not find it good policy to give the new power a trial, even though at some considerable expense in new installation.

In making up the schedule of rates the Cataract Power and Conduit company has had the benefit of such investigations as have been made into the unit and total cost of power in such plants as have been examined, and has applied its rates and method of charge to such plants in order to determine if the results would be any inducement to the users of power in such plants to adopt the electric current. I may say that in every case but one not only were the results financially in favor of the Niagara power, but so far in its favor that it would be difficult to understand why any man should hesitate to take it up when he learns for what price it can be had for use in his own business. There may be a few special cases like the single exception above noted in which the application of Niagara power would be of little advantage, but they would be few and far between and would cut no figure in the general results.

Although for obvious reasons it will be impossible for me to give specific prices, I may say that the cost of power as developed by the schedule of rates, as far as it has been applied, varies from 60 to 90 per cent. of the cost of steam power as actually used. And right here I wish to call attention to a point mentioned in the early part of this talk, and that is that not only is the actual cost smaller for the power as rated by the manufacturer, but by reason of the fact that in many cases the application of electric motors will save nearly or quite one-half of the amount of power now used, which saving must be added to that already made in the lower price, and the two together should be argument enough to induce the extra investment in electrical machinery to make the application to almost any manufacturer's uses.

Advancement in Transformers.

The economic results obtained from the supersession of old-type transformers by those of recent manufacture, and the substitution of one large transformer for several smaller ones, have been demonstrated in a compilation of reports received from electric lighting companies which have made the change. In almost every case the change has resulted not alone in a far more perfect operation of the system, but in an actual saving in money.

Improvement in transformer construction and the use of larger units follow similar developments in other machinery of many of the large central stations. The replacement of a large number of transformers of small capacity, manufactured when the art of transformer construction was not as far advanced as it is to-day, by a few improved transformers of large capacity, has already produced results startling in their importance.

The first instance is that of a company operating in a town of 56,000 population in Massachusetts. In this case 57 small transformers built in previous years were supplanted by 18 of a late type. The total light capacity of the superseded apparatus was 1,499 lights, of the newly installed transformers 1,624. The total core loss of the old transformers was 5,866 watts, of the new only 1,348. So much for the electrical facts. The saving is calculated as follows: 39,578 kilowatt-hours are saved yearly by the change. The value of the saved energy may be estimated at $527.70—equivalent to a saving per light capacity per year of 36.2 cents. Neglecting all the advantages of the change, except those accruing from the decreased core loss, the expense will be met in one year and nine months. The light capacity of the plant is increased nine per cent., the core loss decreased 77.5 per cent. Furthermore, on account of the decreased core loss, not less than 4,518 watts are available for sale at the regular rate with the present station apparatus. This enables the company to add 90 lamps to its circuits, producing an additional income of about $675.

The second instance is in another Massachusetts town. Here 40 new-type transformers supplanted 53 old ones. The total light capacity of those returned was 1,135 lights, of the new 1,070. The core loss in the old-type transformers was 4,845 watts, of the new type 1,343 watts. In this case the annual saving is 30,678 kilowatt-hours, or about $400, and correspond to a saving per light per year of 35.2 cents. The expense of the change, counting core loss alone, will be covered in two years and nine months. Three thousand five hundred and two additional watts are available for sale, increasing the income by $525 per year, while by the use of lamps of a higher economy some 535 kilowatt-hours additional are also available for sale.

There are still three more striking cases, in Massachusetts, of benefits derived from a similar change. In the first the regulation of the station had been so poor that the lamp bills had increased to such an extent that the question demanded immediate attention. While the saving was comparatively small, the beneficial results brought about by the change have proved highly satisfactory. In the second, 81 small transformers of old type were replaced by three of a new type. The core loss of the returned transformers amounted to 2,568 watts, of the new ones 280 watts. Th resultant saving per annum is 20,043 kilowatt-hours, or $267, the saving per light capacity per year 25.74 cents. This is an all-day station, and it is calculated that only 8½ months will be required to wipe out the investment. The third case involves the supersession of 193 old-type transformers by 37 new ones, the total light capacity of the former being 6,035 lights, and of the latter 8,210 lights. The total annual saving is 51,203 kilowatt-hours, or $683, and the total saving per light capacity 14.68 cents. In five years and two months the cost of the change will be fully covered. The capacity of the plant has been increased 36 per cent., the energy required to operate it decreased 47.1 per cent. Five thousand eight hundred and forty-five additional watts were made available and thus an additional capacity of about 116 lights was obtained without adding to the station apparatus. If these lights were burned but three hours daily the result would be an additional annual income of $960. On account of the improved regulation entailed by the change, high-efficiency lamps can be used and about 410 more watts saved. This adds $109.46 to the total annual saving.

Several interesting changes have also been made in the West. One instance in particular merits attention. The details of the change are not available, but by centralizing the transformer distribution the rate of switchboard income was changed from four cents to 12 cents per kilowatt. Another western plant reports that its 1,140-volt circuit, equipped with old-style transformers, showed six to seven amperes in the daytime, while with the new transformers only a fraction of an ampere is shown.

Facts such as these tend to prove not only that constant improvement is taking place in electrical apparatus, but that station managers are realizing that, to secure the most economical results on their systems, such improved apparatus must replace older types built when electrical knowledge had not reached its present high standard. A saving here, less trouble there, the extinction of a difficulty at another point, result in a general benefit which can be exactly calculated in dollars and cents, and tends to the general well-being of the progressive station and communities in which the newer methods are adopted.

New Use for Hoisting Magnets.

A visionary but rather interesting use of electromagnets for lifting purposes has recently been proposed, according to Cassier's Magazine. It is nothing less than the suggestion that the sunken British warship Victoria may be raised by this means. This vessel was rammed and sunk by a sister ship off the harbor of Tripoli over four years ago, and has laid at the bottom of the Mediterranean, with 450 feet of water over it, ever since. The weight of the wreck in water is estimated at 7,000 tons, and the suggested method of raising it is as follows: Powerful hydraulic rams and dynamo-electric machines and a series of heavy electro-magnets are to be arranged on pontoons at the scene of the wreck. A magnet, lowered over the side and coming within reasonable distance of the sunken vessel, would be drawn towards the latter, and, on touching any iron or steel part of it, would immediately stick to it with a power of 100 tons. As each magnet made attachment, which would be indicated by means of an electric dial on the pontoon, a trial pull would be given to the rope to ascertain that a connection had been made to a firm part of the wreck. Should this not be the case, the magnet would come off; its position would be then slightly moved and a fresh attachment made until a firm hold had been taken of the wreck. When all the magnets had been thus fixed, the wreck would be considered ready for raising. Each lifting rope would be attached to the lifting pontoon by means of a sheave on the head of a hydraulic lifting ram having a stroke of 12 feet, which would give an effective lift of 24 feet. Each hydraulic cylinder on the pontoon would be in connection with all the others, and a balancing accumulator would prevent any rope getting more than a normal strain of 100 tons. When the rams had made their full stroke the lifting ropes would all be simultaneously held in position by means of special hydraulic lifting blocks. The rams would then be lowered and another lift of 24 feet given to the wreck, and the operation would be repeated until the wreck would be raised sufficiently near to the surface to be towed to shallower water and there beached. It is estimated that such an undertaking would cost nearly $500,000.

Electric Light Blindness.

[From the Youth's Companion.]

There is a peculiar form of eye trouble caused by exposure of the unprotected eyes to an intense electric light, especially that produced during the fusion of metal by electricity, which has received the name of "electric light blindness."

The trouble begins usually with a feeling of slight pricking and irritation, as if there were fine cinders in the eyes, and this is followed by a persistent overflow of tears and a mistiness of the sight, as if the sufferer were in a fog. The pain, in all but very slight attacks, increases rapidly, and there follows an agonizing aching of the eyeballs, intolerance of light, and often a most distressing spasm of the eyelids. The sight sometimes grows so dim that the patient is nearly blind.

If this accident happens to one who is not regularly employed in electric smelting or drilling, but has merely stopped to look on at the work, the trouble is likely to be thought much more serious than it really is, for the true cause is apt to be overlooked, the intense brilliancy of the light having been masked more or less by the daylight.

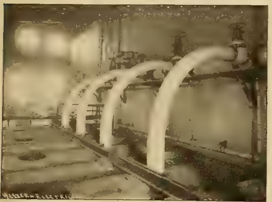
The condition is very similar in its symptoms to that known as "snow blindness," from which hunters in the far north and mountain climbers often suffer, and it is probably an identical affection, namely, a sunburn—in this case an electric burn of the conjunctiva. Firemen frequently suffer in much the same way after working for several hours to subdue a fierce conflagration.

Men who are employed in electric smelting or drilling works always protect their eyes by dark glasses, and the Eskimos do the same by goggles of wood with a slit in the center.

The distress during an attack may be relieved by instillations of cocaine under the direction of a physician, although this drug should not be used when repeated attacks occur, as in the case of firemen, for fear of creating a habit. After the acute inflammation has subsided a simple eyewash of camphor water containing a little borax in solution will usually suffice for a cure.

Nonpareil Cork Pipe Covering.

This material is composed entirely of cork compressed into any form desired in cast-iron molds and baked in a temperature of about 500° Fahrenheit for from eight to 48 hours, according to the mass of material in the mold. This is done without adding any foreign cementing substance whatever, but a natural gum in the cork unites the granulated particles into a solid mass, which remains permanent after cooling. It will readily be seen that as no cement of any kind is used, there is no tendency on the part of the material to disintegrate under the action of water, heat or vibrations. Essential



NONPAREIL CORK PIPE COVERING.

requirements in any pipe covering are high non-conducting power, which cork has in a very marked degree, ability to resist the action of external moisture or leaks in the pipes on which it may be used, and an elasticity which will prevent its being injured by the inevitable vibration to be found in almost all steam lines. In these particulars the superiority of Nonpareil covering is admitted. The durability of the material is attested by the fact that cork steam-pipe coverings in different forms have been in general use throughout Europe for 20 years—England and Germany, the two leading manufacturing countries, having them in most general use—and they stand in high favor there to-day. Experiments extending over a period of three years corroborate the opinion of German and English users of this material, and practical experience has shown it to be especially applicable to electrical work. The coverings at the Berlin, Conn., power house of the New York, New Haven and Hartford Railroad company, which are illustrated herewith, are of this material. The New England Engineering company, which had experience with this covering in the Stamford, Conn., electric plant, was so well pleased that it has ordered the new plant of the New London, Conn., company covered in the same manner. Another notable example is the steam-pipe covering in the new Astor Hotel, Thirty fourth street and Fifth avenue, New York. In that plant over 12 miles of Nonpareil cork sectional covering for steam piping was used, and between two and three miles of coverings for the refrigerating pipes.

Another form which should be of special interest to the electrical trade is the sheet cork to be used beneath the bed plates of high-speed engines, dynamos, etc., to take up the vibration. Still another form that will interest the electrical trade is the heavy compressed cork blocks for use in friction clutches in place of the customary maple blocks. It is a matter of common knowledge that there is frequent trouble with the large clutches used in a great many central stations on account of the inability of the maple to furnish sufficient friction to keep the clutches from slipping, and if the clutch slips at all when thrown into action, the face of the maple is very rapidly burned to a smooth surface, greatly decreasing its natural friction. This does not happen with cork blocks, and actual experience has shown that under the same conditions their life is from five to 10 times as long as maple blocks, and that with the same tension on the [illegible] they will impart from 10 to 25 per [illegible] without slipping. Moreover, if the clutch is overloaded, and does slip, the cork will not acquire that glazed surface which deprives the maple block of its usefulness. In spite of the heavy pressure on these blocks, there is enough elasticity remaining to make them bind tightly when the clutch is thrown into action, and this, added to the friction there is in any cork surface, gives the results mentioned.

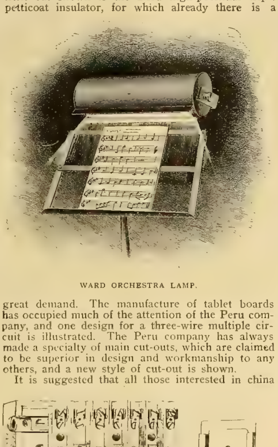
The Nonpareil Cork Manufacturing company of New York controls this product. It has well-equipped factories at Bridgeport, Conn., and is meeting much encouragement from progressive engineers.

Ward Orchestra Lamp.

The cut clearly explains the use of this fixture, which is put on the market by McLeod, Ward & Co. of 27 Thames street, New York. The cylinder usually furnished is supplied with a socket for a 16 candle power lamp. The cylinder is pivoted on the ends and may be revolved in any direction. The cylinder is composed of two pieces, one of which revolves inside the other, so that any desired opening may be obtained, depending on volume of light required. This device, although called an orchestra lamp, is just as valuable for lighting pulpits and pictures. The rector of St. Thomas' Church, New York, experimented with several devices for lighting his pulpit, but, it is said, did not find anything satisfactory until the Ward orchestra lamp was installed. It is fitted with an adjustable clamp for attaching to music racks.

New Peru China Specialties.

The accompanying cuts show a few of the new specialties just placed on the market by the Peru Electric Manufacturing company of Peru, Ind. This company, as almost everyone in the electrical business knows, has developed a fine line of china specialties, and its goods are used all over the country. The cut to the left in the group shows the latest porcelain transformer fuse plug, which, it is said, has given the best results on 2,000 volts. The next cut shown is the Peru high-potential triple petticoat insulator, for which already there is a



WARD ORCHESTRA LAMP.

great demand. The manufacture of tablet boards has occupied much of the attention of the Peru company, and one design for a three-wire multiple circuit is illustrated. The Peru company has always made a specialty of main cut-outs, which are claimed to be superior in design and workmanship to any others, and a new style of cut-out is shown.

It is suggested that all those interested in china specialties of this kind write for further information to the Peru company.

NEW PERU CHINA SPECIALTIES.

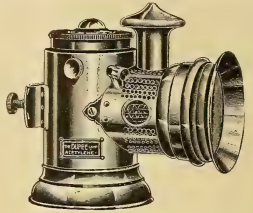
Three Electric Buttons; One Deadly.

[From the San Francisco Examiner.]

Honolulu, December 9.—For the first time in eight years there will be a hanging in Honolulu. The man whose life will be surrendered on the gallows is a Hawaiian named Noa. He will be executed Monday next. Noa's victim was a Chinese storekeeper of the island of Molakai. The scaffold is up and all is in readiness for the hanging. There are three electric push buttons connected with the arrangement, set in a table in a distant building in the prison yard. Three prison wardens will touch them when the word is given. One of the buttons will open the death trap. No man, save the electrician who put them in, knows which one that is.

Dupee Acetylene Bicycle Lamp.

An illustration is herewith presented of the Dupee non-pressure acetylene gas bicycle lamp, which has just been brought out by the White Manufacturing company, 158 Indiana street, Chicago. Prominent features in this lamp are the interchangeability of the various parts and the simplicity of operation. If an accident occurs, such as a collision or an upset, and the lamp be damaged, the injured parts can easily be replaced. It may be stated, however, as proof of the very practical manner in which it is constructed, that samples of this lamp which were



DUPEE ACETYLENE BICYCLE LAMP.

being tested on bicycles and were completely crushed out of their original shape continued to operate as though no harm had been done.

In this lamp the carbide is used in granulated form and is placed in an inside removable cylinder, perforated to permit water to penetrate it. The water is poured into an exterior reservoir, completely surrounding the carbide cylinder, through an opening shown in the cut on the upper part of the side. This opening is covered by a screw cap. The flow of water is regulated by a lever placed at the bottom of the lamp, on the opposite side, and therefore not visible in the cut. Shutting off the water stops the generation of gas, and increasing the flow causes a more rapid generation and a brighter light. The water flows upward through an aperture in the reservoir at the bottom of the cylinder, and as soon as it touches the carbide the gas begins to generate. It is then conducted through a short tube to the burner or passes through the water-jacket to a hole in the top of the reservoir and thus escapes. This avoids the accumulation of gas in the lamp to produce pressure; hence liability to explosion is prevented. While the lamp is burning no more gas is generated than can be consumed. Should a rider stop on the road and extinguish his lamp, the carbide cylinder can easily be taken out before he remounts and the consumed carbide removed from the bottom, so that gas will be instantly generated when the water is turned on, without loss of time waiting for water to percolate through the ashes to the good carbide. The capacity of the carbide cylinder is four ounces, but the lamp need not be charged to its full limit to insure perfect operation. It consumes about half an ounce in an hour.

The Dupee lamp is manufactured with the utmost care. The shells and body parts are all drawn from sheet metal. Rivets and screws are exclusively used for connecting all parts, no solder being employed. The front ring is fastened to the body of the lamp by a bayonet lock, to enable it to be easily taken off, when the reflector can be lifted out to be polished. The reflector is parabolic, that form giving the best results. A bracket is furnished for attaching the lamp to the head of the bicycle. It should not be placed on the fork or axle, as the light is so intense that a wider area is illuminated when on the head. It will not blow or jar out. The reflector and chimney top are made of aluminum to prevent discoloration by heat, but all other parts are handsomely nickeled. Red and green "jewels" ornament the sides.

Long Trolley Rides.

[From the Boston Herald.]

A local paper, in an article on the electrical street-car systems of Eastern Massachusetts, gives a description of what is alleged to be the longest trolley trip in the world, it being run from Providence, R. I., to Nashua, N. H., through Boston. The start, according to the author's route, is from Market Square, Providence, thence through Pawtucket and North Attleboro to Plainville, the only break being between Plainville and Norwood, which is at least 14 miles in length. An extension of the Norfolk Central line from Norwood to Walpole will be in operation within a very short time, but even then it will only reduce the break about 3½ miles. The Norfolk Southern street railway has been granted locations through the towns of Norwood, Foxboro and Mansfield, but it is hard to say when this line will be built. When it is in operation there would still be a distance of 3½ miles between Foxboro and Plainville, which would have to be covered by carriage.

But, even if this line was really in operation, covering a distance of 110 miles, it would not be the longest trolley ride in the world, as it is pos-

sible to make a trip of 124 miles over lines in actual operation, viz.: From the residence of Henry H. Rogers, vice-president of the Standard Oil company, at Fort Phœnix, in Fairhaven, to Nashua, N. H., the route being through New Bedford, Fall River, Taunton, Bridgewater, Brockton, Braintree, Quincy to Boston, and then through Malden, Melrose, Wakefield, Reading, Wilmington, Billerica, Lowell, Dracut to Nashua.

The only break in this line is from Bowensville, a part of Fall River, over Slade's Ferry Bridge, a distance of about one mile. This connection is made by means of a coach which meets every car, free transfers being given. The tracks are now being laid, and it will be but a short time before the entire distance will be connected by rail.

Mexican Telegraph Changes.

An arrangement is said to have been made between the Mexican government and the Western Union Telegraph company by which all telegraph business between Mexico and the rest of the world shall be handled by the Mexican federal telegraph lines and those of the Western Union company, to the exclusion of all other lines. By the terms of this arrangement all dispatches are to be transmitted by the Western Union at Laredo and El Paso, Texas, and from the Mexican federal lines to the cable at Galveston.

The reason that led the Mexican government to make this arrangement with the Western Union is said to have been the fact that the telegraph lines owned by the Mexican railroad companies have been for some time violating their concessions. It seems that each railroad company in Mexico has a telegraph line which it owns. By the terms of the concessions from the Mexican government these lines are permitted to transmit railroad business only. The railroad companies, it is said, have repeatedly violated their agreement with the government. Some of these lines have connections with the Postal Telegraph company and others with the Western Union.

When General Manager Chandler of the Postal Telegraph company was asked by a reporter what he knew about this arrangement, he said:

"I know that some time ago an arrangement was made between the Western Union Telegraph company and the Mexican Telegraph company, which is controlled by the Mexican government, for an exchange of business. I have not heard that the result of this arrangement would exclude all other telegraph companies from doing business in Mexico. If such were the case I think I should have heard of it. I know that there has been some controversy between the Mexican government and the railway telegraph lines over the interpretation of the language of the concessions made by the government to these lines. I know also that some legal arguments on the question have been made. I have read the articles of concession and, if the English language means anything, it seems to me that the articles of concession give the railway telegraphs perfect right to handle commercial business. However, this is a question that must be settled between the Mexican government and the railroad companies, and one in which the Postal Telegraph company is not particularly interested."

Illinois Street Railway Association.

In response to an invitation addressed to the street railway companies of this state, representatives from all parts of Illinois met at the Great Northern Hotel in Chicago, on January 5th, and formed the Illinois Street Railway association. The following-named officers were elected: President, W. H. Patterson, Bloomington; vice-president, L. Sherwood, Elgin; secretary and treasurer, T. J. Minary, Springfield; executive committee, W. H. Patterson, C. K. Minary, L Sherwood, W. L. Ferguson, Decatur; B. F. Harris, Champaign; J. Barker, Peoria, and W. F. Brennan, Chicago.

The constitution as adopted set forth as the aim of the association the closer affiliation of all street railway companies in the state for the purpose of improving methods of construction and maintenance of railways. It is intended to hold yearly meetings, when papers will be read upon recent improvements and devices in track construction, correct appliance of motive power, electric equipments and economic devices which will tend to lessen the expense of car locomotion.

City Restrained from Building Lighting Plant.

Judge Tuley has decided that the city of Chicago is in the wrong in attempting to expend $150,000 on special appropriation for municipal lighting plants and extensions. The council appropriated the money by a special ordinance; the mayor approved the measure; the controller and city electrician prepared specifications and received bids; but now the court, on application of one Charles M. Nicholls, who brought suit as a taxpayer, holds that the whole proceeding is illegal. The judge says: "The statute is too plain for any argument really upon the question. That ordinance is invalid; the appropriation that is intended to be made by it is invalid and the injunction must issue as prayed for." Thus the money is considered as not appropriated and the whole matter will probably be dropped, as it is not considered likely that the city will take an appeal.

CORRESPONDENCE.

New York Notes.

New York, January 4.—Owing to the adverse attitude of Mayor Van Wyck, who insists that the margin of the city's debt-incurring power is not such as to allow it to proceed with the underground road, and suggests as a solution of the transit problem that a demand should be made upon the existing lines to improve and extend their systems, and that the elevated railroad companies should be compelled to substitute electricity for steam, the principal dependence of the friends of the tunnel scheme lies in the Metropolitan Street Railway company. That company is considering the plans of the Rapid Transit Commission, and should it resolve to secure the construction of the road, it is not believed that the city administration would oppose it. Other building syndicates have been mentioned, but undoubtedly the street railway company is in the best position of all to undertake the work. On the part of the Rapid Transit commissioners, the next step will probably be an application to the Appellate Division of the Supreme Court to modify or interpret the $15,000,000 bond stipulation so that the bond will only be required to cover the period of construction.

One of the last acts of the Gas Commission, which went out of existence with the year, was the awarding of contracts, tentatively, for city lighting this year. This work now devolves on the commissioner of public buildings, lighting and supplies, under the new charter. The budget for street lighting being over $106,000 short of the amount required to pay for all the lights decided on, the amount appropriated being $1,290,360, and the money needed, when the bids were tabulated, $1,396,594, the successful bidders were informed by the commission that they would have to go to the new Board of Estimate and Board of Public Improvements for the deficiency. The electric lighting of the city was awarded as follows: Brush Electric company, 91 arc lights at 45 cents a night and 975 arc lights at 40 cents; Mount Morris Electric company, 630 arc lights at 40 cents and 194 arc lights at 45 cents (this company will light the Harlem Speedway); Manhattan Electric Light company, 10 arc lights at 50 cents and 840 arc lights at 40 cents (this company will light Park avenue under the elevated structure of the New York Central in Harlem with 100 incandescent electric lights at $22.50 a year for each light); Harlem Lighting company, 66 arc lights at 40 cents and 19 arc lights at 50 cents; Edison Electric Light and Power company, 524 arc lights at 40 cents and 363 arc lights at 50 cents; North River Electric Light and Power company, 1,052 arc lights at 45 cents; Pelham Electric company, 95 arc lights at 40 cents. It is interesting to note that the Welsbach Street Lighing company of America was given the contract to light Central Park with 500 naphtha lamps at $30 a year for each lamp.

When Mayor Wurster of Brooklyn vetoed the aldermanic resolution granting a franchise in perpetuity to the Municipal Electric Light company for the use of the streets of Brooklyn, James Matthews, a taxpayer, securing an injunction restraining the Board of Aldermen from overriding the veto. Justice Van Wyck in the Supreme Court, on December 30th, modified the injunction, so that the aldermen could grant the franchise for a period not exceeding 25 years, as provided for in the charter of the Greater New York. Thirty minutes later the aldermen met, and were about to grant a franchise, when an injunction granted by Justice Van Wyck to Albert J. Young, a taxpayer, was served upon President Stewart, restraining the board from granting franchises of any character to any corporation.

The Brooklyn Heights Railroad company has practically decided to put a number of double deckers on its Sea Beach route next summer, attached to the motor cars as trailers. The company recently acquired this line and will soon equip it with electricity. It extends from the Bay Ridge shore, at the foot of Sixty-fifth street, to Coney Island.

Among the appointments made by Mayor Van Wyck is that of commissioner of public buildings, lighting and supplies. Henry S. Kearney secures this plum, which is good for six years at $7,500 per year.

It is expected that the Brooklyn trolley cars will be running regularly across the East River bridge by Saturday night. It is thought that this improvement will be of great benefit to the thousands of working people who use the bridge daily.

M. S.

PERSONAL.

Marshall Scobey of the Western Electric company's electrical supply department entertained a number of his Chicago electrical friends on his birthday.

James Dredge, editor of Engineering, London, and one of the English commissioners at the World's Fair in 1893, was created a companion of the Order of St. Michael and St. George in the distribution of New Years honors in Great Britain.

Major Benjamin Butterworth, the commissioner of patents, is very ill at Thomasville, Ga. A recent attack of pneumonia left him very weak, but his present illness is said to be caused by a kidney complaint. His family and other relatives are at his bedside.

S. G. McMeen, the engineer of the Central Union Telephone company of Chicago, was united in marriage to Miss Auta Judith Proctor at Ashtabula, O., on December 22d. Mr. McMeen is a director of the Chicago Electrical association, and is popular with his associates. He and his bride receive their friends at 6245 Greenwood avenue, Chicago.

A memorial to the late Prof. J. J. Sylvester is proposed, and an appeal has been made by Raphael Meldola, professor in Finsbury Technical College, London, Eng., who is secretary of the memorial organization. It has been estimated that $5,000 will be sufficient for the proposed endowment, and of this about one-half has already been subscribed. Prof. Meldola says: "In appealing to the American public to enable us to complete the desired sum I am, in the first place, prompted by the consideration that Sylvester's association with the Johns Hopkins University and the leading part which he took in advancing mathematical science in America render his claim to estimation on the part of the citizens of your country quite a special one. It is proposed that the fund when complete shall be transferred to the Council of the Royal Society of London, that body having undertaken to accept the trust and to award the medal triennially to mathematicians of all countries."

The wedding of Prof. Alexander Melville Bell, the father of Alexander Graham Bell, the inventor of the telephone, to Mrs. Harriet G. Shibley of Harrowsmith, Ontario, on January 1st. at the Park Avenue Hotel, New York, was private, and only a few friends and relatives were present. The Rev. Dr. Patterson of Binghamton, who is Prof. Bell's oldest living pupil, performed the ceremony. The Hon. John Hitz was best man, and Mrs. Shibley was attended by her niece, Miss Hattie Mace of Tamsworth, Ont. The other guests were Alexander Graham Bell, his daughter, Miss Elsie Bell; D. C. Bell, brother of the bridegroom; C. C. Shayne and Harris Guest. Profesor Bell was born in Edinburg, March 1, 1819. For 22 years he was a lecturer at Edinburg University and at New College. Later he lectured in the London University, and in 1870 came to Kingston, Canada, and lectured in Queen's College, in that place. In 1881 he removed to Washington, where he has since lived. His wife is 25 years his junior.

ELECTRIC LIGHTING.

From Berlin, under date of January 4th, is sent the statement that the German Transoceanic Electric company has been formed, with a capital of 10,000,000 marks, for the purpose of erecting electrical stations in America. A central station will first be established at Buenos Ayres for lighting and general supply.

The Board of Trustees of College Point, L. I., on December 30th signed a contract with the Flushing Electric Light and Power company for 87 arc lights for five years. The bills will be presented to Greater New York for payment. The work of putting up the poles was started immediately upon the signing of the contract.

Whitehall, Wis., is said to be the smallest village in that state having an electric light plant. The installation includes a 50 horse power turbine water wheel, a 450-light dynamo, several inclosed arc lamps on the streets and about 200 16 candle power lights in stores and dwellings. The Whitehall Times says: "We question whether there is another plant in the state that furnishes 16 candle power electric lights at one cent a night each, which is the cost of ours."

For several months the Hot Springs, Ark., water, gas and electric light companies have been making an effort to reach an agreement with the city whereby they would receive pay for services rendered from month to month. The question has been submitted to the City Council several times recently, but nothing definite was done. The propositions were rejected December 23d, and the mayor has been served with notices that the water and lights will be turned off at once, and employes of the companies have been engaged in dismantling the water plugs and removing the arc lamps from the poles.

On December 28th the village of Mount Morris, N. Y., held a special election to vote on the proposition to extend the present contract with the Mount Morris Illuminating company for a period of five years from April 10, 1900. The subject aroused but little interest, it would seem from the vote, for all the matter was quite important. The total vote cast was 130, of which 111 were for and 28 against. The condition and circumstances that led to the early action on a contract that has yet two years to run were that some time ago a company of capitalists offered to put in a new water power dam on the Genesee River where the one was washed out last

spring, if the race company would sign over its water rights to the new company and agree to take so many shares of the company's stock at a certain price. All interested agreed to do this but the Mount Morris Illuminating company, which refused to sign it unless the village would extend the contract for street lighting for five years from the time of the expiration; hence the election. Now that the proposition is carried, Mount Morris will once more have a good water power. The present lighting plant is now operated entirely by steam.

A large number of bids for installing the electric light and power plant in the new postoffice building in Washingon, D. C., were opened on December 30th. Some of the bids were for the complete plant, some for switchboard and wiring, others for engines, and a number for dynamos alone, so that no intelligent comparison of prices could be made without an extensive tabulation. Moreover, the specifications allowed bids to be put in on units of varying number and capacity. Among the western bidders were the Fort Wayne Electric corporation, the Chicago Edison company, the Western Electric company, Siemens & Halske Electric company and Arthur Frantzen & Co. of Chicago.

The annual report of the St. Petersburg and Moscow Electric Lighting company, recently published, states that the total gross earnings were $850,000, and the expenses were $500,000. The net receipts amounted to $300,000 and after deducting the cost of administration for both towns there is a profit remaining of $270,000, of which $54,000 is written off for depreciation, $10,800 for government taxes, and $23,000 for the reserve and insurance fund. A dividend at the rate of six per cent. was declared. Several large debts had been paid off during the year, which had reduced the working capital. The erection of the new St. Petersburg station has been retarded, and the station will not be in operation till next summer. The work at the new Moscow station had progressed so that the regular supply of current was started on November 1st. These works, which have a capacity of 20,000 sixteen candle power, will be increased to 40,000 when the enlargement is completed. The length of the streets in which cables have been laid is 33 miles, and next spring it is contemplated to put in 13 miles more, as the applications for connections are very numerous. Since the enlargement of the works commenced, there have been during the year 1,774 new lamps connected in St. Petersburg and 2,888 in Moscow, making the total lamps connected up to date 60,671.

ELECTRIC RAILWAYS.

The plants, franchises and other property of the Milwaukee and Wauwautosa Motor Railway company, the North Greenfield and Wauwautosa Electric Railway company, the Waukesha Electric Railway company and the Waukesha Beach Electric Railway company have been conveyed to the Milwaukee Light, Heat and Traction company, which is owned by the Milwaukee Electric Railway and Light company.

The Board of County Commissioners at Goshen, Ind., December 24th, granted to the Elkhart, Goshen and Southern Railroad company a franchise to run an electric street railroad from Elkhart to Goshen and from Goshen to Waterford, New Paris, Syracuse and Wawasee Lake. The road is to be built within one year. The incorporators are W. H. Holcomb and Herbert Holcomb of Chicago, H. D. Judson, N. J. Aldrich and F. G. Mills of Aurora, Ill.

A trolley car of the Schuykill Valley Traction company was held up by four highwaymen at Swedeland, near Norristown, Pa., December 26th, about 10 o'clock at night. Conductor Charles Galloway refused to give up his money and was shot dead. Three shots were fired at Motorman Matthias, but none took effect. After rifling the body of the conductor of the money and a gold watch the robbers escaped. There were four women in the car, but the highwaymen covered them with their weapons, but made no attempt to rob them.

The Hudson River and Long Island Sound Railway company, with its principal office in New York city, was incorporated at Albany December 29th, with a capital of $100,000, to construct a street surface road to be operated by electricity in Westchester county, about 10 miles in length, from the New York Central station in Yonkers to the village of Pelham Manor, near the New York city line. The directors are Charles C. Bassett of Washington, Henry A. Welch of Detroit, James F. Secor, Jr., of Pelham Manor, D. B. Halstead, Paul Gorham and John H. Seed of Brooklyn, [illegible] Baker and Walter R. Quick of New York city and William [illegible] Stout of Elizabeth, N. J.

Three persons were injured in a trolley-car runaway at Providence, R. I., December 26th, when a Camp street electric car rushed down Olney street hill with the speed of an express train and shot across North Main street into the corner of a frame building. Three persons were injured. The impact of the collision was so great that some of the heavy ironwork on the car was doubled up, and the corner post of the building, which acted as a buffer, was badly splintered. That the occupants of the car escaped with their lives is remarkable.

There were about 10 passengers in the car at the time besides the motorman and conductor. One of the most surprising things was the escape of the motorman, who stuck to his post.

Lyons, France, is considering the advisability of changing the present street railway service to an electric system. It is also determined to extend the service soon to the old section of the city and to the fashionable residence portion of the town. An electric line is to be constructed from Croix-Rousse, the home of the weavers, to Saint Blandine, a distance of five miles. The latter place is near the principal railway station of Lyons. The present steam railroad, nine miles in length, connecting St. Just with Vaugeneray, will soon be changed to an electric line. From Vaugeneray it will be continued a distance of 20 miles to Symphorien-Sur-Ciose. From St. Just there will be an electric line constructed to Francheville-le-Haut, a distance of four miles. An electric line 45 miles in length will connect the Chazelles-sur-Lyon depot with St. Symphorien-sur-Coise, and one of seven miles will extend from Lyons to Chaponost.

Foster & Louis, the Chicago contractors, have sold their contract for the building of the Holland, Mich., electric railway and lighting plant to H. B. Black, I. E. Cockran, Jr., and Mr. Powell, all Chester, Pa., capitalists. At a recent meeting in Chicago of the Holland and Lake Michigan Railway company, Messrs. Humphrey, Larsons and Ferguson were succeeded by the election of new officers, as follows: President, H. B. Black; treasurer, Mr. Powell; secretary, I. E. Cockran, Jr. The stock and bonds were also turned over to the new organization. The city of Holland has extended the franchise, which expired January 1, 1898, to June, 1898. This road, when completed, will be seven miles in length and will operate between Holland, at the head of Black Lake, and Ottawa Beach and Macatawa Park, well-known Michigan summer resorts. The grading, bridges and power house are all completed; the machinery is on the premises, and it will only take some four or five weeks to complete the road ready for operation.

A street-railway transfer line connecting several downtown railroad stations of Chicago will be put in operation soon, it is claimed, by Charles T. Yerkes and the interests which he represents. The stations are the Union passenger station, Adams and Canal streets; the Northwestern station, Wells and Kinzie streets; the Rock Island station, Van Buren street and Pacific avenue; the Polk street station, Dearborn and Polk streets, and the Illinois Central station, in Park row. The new line will be operated by electricity and a five-cent fare will be charged. It is said that special attention will be given to the transfer of small baggage. This will not include the large sample trunks of commercial travelers, nor the almost equally bulky properties of the theatrical tourist. An arrangement may be made by which the transfer system will include connections with the Wisconsin Central station, Fifth avenue and Harrison streets, by means of a transfer at Fifth avenue and Van Buren street.

The Utah American and Foreign Development company of London has undertaken the development of a large section of Utah, through which it intends to build an electric road 82 miles in length. This will connect Ogden, Salt Lake City and Provo, Utah. The district through which the road will run is said to be very rich, both agriculturally and in the line of mineral resources. The road will reach Provo cañon, which forms the only natural outlet for railroads in that direction, and it is expected that steam railroad extensions will be built, the traffic being handled electrically over the 80 miles of the company's lines. It is proposed that the power house will be located between Salt Lake City and Provo and three miles from the former, so that the maximum distance between the power plant and either end of the line will be 42 miles. The plant is designed for 20,000 horse power. There are said to be very extensive iron and coal deposits along the line of the road, which, it is thought, can be successfully developed by means of electric power.

Arrangements for the construction of an extensive electric railway are said to have been completed by the projectors of the Geneva Lake, Sycamore and Southern railway and the projectors of the Kankakee, Wilmington and Morris railway. It is proposed to consolidate the lines and thus form the longest line of electric railway extant. The eastern terminus of the road will be Kankakee, Ill. From this point the road will follow the Kankakee River to Wilmington, and from there to Morris, with a branch to Joliet. From Morris the road will traverse the Fox River Valley, connecting with lines from Elgin and Aurora, to Sycamore and thence to Geneva Lake. This road will penetrate country not at present occupied by any steam lines. The population of the points it will strike and connect with and which it will depend upon for traffic exceeds 500,000. The new line will be constructed through the most picturesque portion of the Mississippi Valley. Right of way from Kankakee to Morris has been secured by capitalists interested in the Kankakee, Wilmington and Morris road.

TELEPHONE.

It is said that the Bell Telephone company will renew its application to the town council of Hampton, Va., to establish an exchange there. The company has been twice refused permission to enter Hampton, but since that time, it seems, public opinion has undergone a change.

Florence, Ala., will soon have telephonic communication with Leighton. The wires are strung to a point within one mile of the Sheffield exchange. The Southern Bell company has also in mind a line from Florence to Cherokee and Riverton, which will be put in operation some time during the winter. The company is also figuring upon extending this line so as to take in Waterloo and Russellville.

The late storm played havoc in Mobile, Ala., with the lines of the Home Telephone company. Poles were blown down in all parts of the city and wires carrying heavy currents fell upon the telephone lines. The switchboard in the telephone exchange began to smoke, showing the presence of a high current, and in order to save it the manager cut the wires, but not until two cables of 100 wires each had been burned out.

A cable dispatch from Berlin, January 1st, says that the annual charge of $37.50 for telephone service will in future be replaced by a yearly rent of $12.50 for the apparatus plus the small charge of about one-fourth of a cent for each conversation by private persons, half a cent for business men and firms and three-quarters of a cent for clubs, cafés, etc. Business men oppose the proposal that they be charged more than others.

Six per cent. bonds of the Central Union Telephone company amounting to $1,200,000, part of an authorized issue of $3,000,000, are offered for sale at 105 and accrued interest. In the statements made to aid the sale of the bonds it is noted that the company holds licenses for all the instruments and apparatus owned or controlled by the American Bell Telephone company in Ohio, Indiana and Illinois, with the exception of a few counties containing large cities, and is operated under the policy of the American Bell Telephone company, which owns more than half of the capital stock of the Central Union Telephone company and also a large part of its bonds. A statement of accountants, accompanying the announcement of the bankers, says that the net earnings of the company for the five years ended December 21, 1896, were $306,784 per year. The net earnings for 1897, partly estimated, were $340,787, or more than double the amount necessary to meet the total interest charge.

By way of a special Christmas treat to the patients of All Souls' Hospital in Morristown, N. J., arrangements were made for them to hear the Christmas Day services at the Church of the Assumption, which is about a mile distant from the hospital. As it was obviously impossible for the bedridden patients to go to the service, the service was brought to them by means of the telephone. Each patient had a receiver, and in this way not only the sermon of Dean Flynn, but also the music and prayers, were heard at the hospital with practically the same distinctness as in the church. The sermon was from the text: "Fear not, for behold I bring you tidings of great joy, which will be to all the people, for this day is born to you in the city of David a Savior, who is Christ the Lord." [Luke ii., 10-11.] This is said to be the first time a Roman Catholic service has been thus transmitted. The patients at the hospital were delighted with the welcome break in the monotony of their life, and the experiment may be repeated shortly.

ELECTRICAL SECURITIES.

Of the $3,000,000 Central Union Telephone company's bonds authorized by the mortgage of July, 1896, $2,500,000 are now outstanding.

The North Chicago Street Railway company has declared its quarterly dividend of three per cent., payable January 15th to stockholders of record January 5th.

The New York and New Jersey Telephone company has declared a quarterly dividend of 1½ per cent. and an extra dividend of one per cent. payable January 15th.

The New Orleans Traction company reports gross earnings for November of $80,042, a decrease of $15,188 as compared with the same month of last year, and net $35,060, a decrease of $6,071. For the 11 months ended November 30th the gross earnings were $1,120,324, a decrease of $83,581 as compared with the corresponding period of last year, and net $354,470, a decrease of $102,741.

The Chicago Edison company has issued another $100,000 of its authorized $600,000 gold bonds, making the total amount now outstanding $2,075,000, all of which bear five per cent. interest. The proceeds arising from the sale of the bonds will be used to pay for recent acquisitions and to make improvements contemplated with a view to the practice of greater economy in operation. With its increased business the company's plants are overtaxed during the busiest hours.

A plan has been proposed for the reorganization of the Nassau railroad system in Brooklyn, which contemplates a new issue of stock and bonds to the amount of $30,000,000, with the bonds on a four instead of a five per cent. basis. A new company will

either be organized or the corporations composing the present system will be merged into the Nassau company. By this plan there would be a saving, it is said, of nearly $200,000 a year alone in rentals to the Kings County Traction company. It is said that a syndicate headed by Banker R. T. Wilson has been organized to undertake the entire reorganization, which will probably extend over a period of two years.

MISCELLANEOUS.

Louis M. Packer of Lynn, who brought suit against the Thomson-Houston Electric company for $100,000 for the loss of both hands in an "undercut" machine at the works of the company nearly two years ago, obtained damages in the sum of $20,000 from a jury in the Superior Court at Salem December 29th.

Secretary Long of the Navy Department has accepted the proposition of the Union Iron Works, San Francisco, to install a central electrical plant on the battleship Wisconsin, now building there, of the same character and at practically the same terms as those recently authorized on the Alabama and the Illinois. This will cost $11,400, which includes an extra $900 for freight to the Pacific coast. The electrical installation will operate the turrets and ammunition hoists of these ships.

Electricity has been put to a new use at the hennery of William B. Beakes, in Newburg, N. Y., according to the New York Sun. On Thursday morning of last week an unknown man was found unconscious and almost frozen at the door of the hennery. William B. Beakes, Jr., who is something of an electrician, had charged the knob on the door with electricity. When the man took hold of the knob he received a shock which rendered him unconscious. When restored, he said he had been looking for shelter for the night, but knew nothing more after touching the knob.

A strange prenomenon at this season of the year was the lightning which flashed from the clouds during the terrific blizzard at Rockland, Me., January 1st. It was to the lightning that Captain Spencer and six men of the crew of the schooner Nevada owe their lives. The Nevada was driven on the high ledges of Griffin's Island at midnight and soon went to pieces. The captain and crew had barely time to launch a small boat when the vessel went down, and they reached the island only after a desperate struggle with the elements, the sharp flashes of lightning showing them where a safe landing could be effected. They were taken off the barren island by the life-saving crew of Tenant's Harbor station, after suffering considerably from exposure to the cold and storm during the night.

TRADE NEWS.

Hodge, Walsh & Loring have removed their establishment to 701 Delaware street, Kansas City, Mo. They sell supplies and do construction and repair work.

New Years would lose something of its hopefulness if "Charlie" Shain's cheery greeting was missing. This year Mr. Shain sends to his friends just 1898 good wishes for the new year.

Owing to lack of shop room, the Hoffman & Billings Manufacturing company of Milwaukee has transferred its Corliss engine business to the Rarig Engineering company of Columbus, O.

As the result of a recent extended trip through the country, Mr. C. O. Baker, Jr., of Newark, N. J., gives it as his opinion that the new year bids fair to be a prosperous one from a business point of view.

The People's Electric company of Madison, Wis., and the Western Electrical company of Omaha, Neb., have lately taken agencies for the Perfection dynamo brush and Rogers' commutator lubricant, hich are manufactured by the Ohio Electric Specialty Manufacturing company of Troy, O.

One of the most unique of the many calendars which we have received this season is presented by General Agent J. P. Williams of 39 Cortlandt street, New York, being a representation of the well-known Paragon fan motor, in colors, half size and with the blades attached separately to the calendar so that they can be moved as desired. Upon each of the four blades is printed three months of the year.

Mr. Edward J. Wessels, who for the last four years has been managing director of the Standard Air Brake company of New York, severed his connection with that concern on January 1st. Mr. Wessels can well be proud of the record he has made in this line of business. The air brake was little known to street-railway men when he took hold of it, and through his incessant work he achieved a deserved success, and the market for this product abroad has been beyond expectations. Mr. Wessels has several business propositions in the electrical line under consideration.

At the regular annual meeting of the Anchor Electric company, 71 Federal street, Boston, it was voted to increase the capital stock to $100,000. Officers were elected as follows: Norman Marshall, G. O. Proctor, G. H. Proctor, Arthur Howland, directors; G. O. Proctor, president; G. H. Proctor, vice-president; Norman Marshall, treasurer and manager; Arthur Howland, secretary. The growth of this wide-awake concern has been very rapid and its present facilities for supplying its well-known specialties are sometimes severely taxed. The merits of the Anchor switches are so generally recognized that it is not necessary to explain how this concern has built up its large trade.

The New Years souvenir of the Partrick & Carter company, or rather Partrick, Carter & Wilkins, as the firm is now known, is a handsome memorandum-book, bound in celluloid and leather, with gilt edges. In sending this tasteful gift to its patrons the firm does so "with the hope that the year which has gone has not dealt harshly with you, and that the year to come will bring to all a fair share of prosperity and happiness." The firm is composed of Franklin S. Carter, Charles M. Wilkins and E. Ward Wilkins. It has been in existence for many years, and in the manufacture and sale of electrical supplies it has a reputation as wide as the country. The address is 125 South Second street, Philadelphia.

A warm and cheerful greeting was extended to visitors at the New York offices of the India Rubber and Gutta Percha Insulating company on the afternoon of December 31st, when the company held its annual reception. The courtesies were extended by General Manager W. M. Habirshaw, who was assisted by J. W. Godfrey, F. W. Harrington and J. P. Olson. A bountiful lunch was provided, with all of the necessary adjuncts of good cheer, and the health of Dr. Habirshaw and the success of his company was drunk many times. A feature in connection with this reception consisted in a number of musical selections by the members of the Redpath Lyceum Bureau, and also some astonishing feats in legerdemain. At six o'clock cabs were ordered, and those that were brave enough to enter them were entertained by a miscellaneous fusillade of old shoes and the like, which led many to believe that something very important had been transpired in the neighborhood of 15 Cortlandt street. In all it was the most successful social gathering that this company has entertained.

The increase in demand for thoroughly reliable apparatus in the electrical trades has resulted in the growth of many concerns which confine themselves exclusively to certain specialties, and are therefore naturally able to become leaders in their respective lines. The question of proper rheostat control for the fields of dynamos and for the starting and regulating of motors, as well as resistances for cauteries, dental lathes and many other applications of the electrical industry, has always been considered of special importance to electrical engineers and builders and users of electrical machinery. Recognizing this principle, the Iron-clad Rheostat company of Westfield, N. J., was formed in the spring of 1895, with the intention of providing the electrical fraternity with the best that could be produced in the rheostat line. Thousands of rheostats, which have given universal satisfaction, have been manufactured by them since that time, and an entire reorganization of the manufacturing as well as the business departments of the company now gives it exceptional facilities for prompt shipment of orders, whether of a standard or special nature. The Iron-clad Rheostat company has recently standardized an entire new line of motor starters and will be pleased to furnish prices, give information, etc., to .ybody interested.

Writing of the general business situation, Mr. John A. Walker, the vice-president of the Joseph Dixon Crucible company of Jersey City, says: "In 1893 it was a case of business paralysis, in 1894 we had a year of debility, in 1895 the patient partially revived, in 1896 came a relapse, but in 1897 came recovery and the patient took up his bed and walked. The great medicine man was dollar wheat and 30-cent corn, plus poor harvests at this exigency abroad. I saw it myself, for in November I visited Indianapolis, Cincinnati, Chicago, Omaha, Denver, Kansas City, Pueblo and St. Louis, and saw everyone up to his eyes in new business. The consumer at last had money once more, and was spending it. The industrial triumphs of 1897 are important. In this year the business cloud passed away and another era of prosperity, hopefully of long duration, opened. Export trade was larger in the fruits of the harvest, and particularly in manufactured goods, than in the history of the country. Americans are competing in every market. American motors won the order in London. On a bridge in Holland an American firm was the lowest bidder. American steel rails go regularly to China, Japan and India. A movement is on foot to have the English Parliament pass a law changing the stamp on goods not made in England to "Abroad" instead of the name of the country where they are made. This is an effort on the part of the English law-makers to obscure the origin of these goods. For the Dixon company personally, we have shared in the general prosperity. The year has been an agreeable one, the future looks rosy to those who have eyes to see. Perhaps the outlook was never more inviting. Never were there so many roads open to wealth to those who know how to find them."

BUSINESS.

The Western Electric company has a large and most complete supply of interior conduit in stock in its Chicago warerooms.

A folder showing the advantages of Rainbow, Honest John and other steam packing may be had on application to the Peerless Rubber Manufacturing company, 16 Warren street, New York.

A good general battery catalogue is that of the Gordon-Burnham Battery company, 82 to 86 West Broadway, New York, lessee of the Law Battery company. The Gordon and Law cells are described, and also many accessories and apparatus supplied with current from primary batteries, both for medical and general use.

A very handsome battery catalogue is that of the Chloride of Silver Dry Cell Battery company of Baltimore, which has just been issued. It is devoted to medical batteries, and certainly should arrest the attention of physician and supply dealer. A large number of sets and combinations and many appliances for electro-medical work are shown.

The battery and specialty department of the National Carbon company of Cleveland has been so crowded with orders that the company has been obliged to nearly double its force. A large number of new carbon specialties, in the way of back plates and transmitter parts, have been added to the company's already long list, and the National people are prepared to make anything desired in the specialty line on short notice.

Proprietor D. A. Kusel of the D. A. Kusel Telephone and Electric Manufacturing company of St. Louis reports a nice business on the opening of the new year. The company has just closed a contract for a county line, including all material, construction and instruments, from Columbia, Mo., to Jefferson City, Mo., taking in all intermediate points. This line will require some 30 long-distance telephones and be completed in about a month.

Three diplomas of merit to one concern shows pretty well what the judges of the Tennessee Centennial Exposition think of the Robertson-Thompson indicator, Lippincott planimeter and Eureka packing. James L. Robertson & Sons, New York, entered these three articles and were awarded the diplomas. They say that if engineers and steam users would send for illustrations and descriptions of these goods it would not only be of interest but profit.

The Electric Appliance company, Chicago, reports that its new issue of General Catalogue No. 12 is now very generally distributed all over the country and is producing very satisfactory results. Certainly very few buyers could resist the temptation of ordering from such a handsome and useful publication. The Electric Appliance company is entitled to all the good that its catalogue may bring to it, as the production involved much work and expense.

The Morrell Electric Works, 25 South Eighth street, St. Louis, is now pushing the branch of its business devoted especially to the manufacture of standard street-railway motor commutators, and also formed armature coils for street-railway motors. These coils are prepared by the Morrell Works by a process similar to that employed in the best factories, and each coil is of an exact size and so shaped on an accurate die that it may be instantly, on receipt by the user, slipped into position on armature. The Morrell Works is also energetically pushing general repair work on transformers and other electrical apparatus.

ILLUSTRATED ELECTRICAL PATENT RECORD.

Issued December 28, 1897.

596,054. Electric Railway. Eben C. Crocker, Bridgeport, Conn. Application filed April 23, 1897.

This system comprises a supply conductor, a third rail consisting of insulated sections and a power collector carried by the car, two series of double wound magnets arranged in horizontally disposed couplets, the magnets of one series being connected in quarternate pairs in circuit with pairs of alternate magnets of the other series, and connections with the conductor and sections through intermediate circuit closers and breakers operated by the magnets, whereby the section having contact with the collector is in closed circuit while the sections immediately succeeding and preceding are in circuits capable of being closed by the collector.

596,085. Electrical Signal Bell for Street Cars. James P. Orr, Pittsburg, and Th[illegible] vin, McKeesport, Pa. Application f[illegible] 3, 1896.

In an electric signal bell there is the [illegible] bell clapper and its arm, a ratchet [illegible] friction rollers adapted to engage the [illegible] and an automatic circuit opener with [illegible]

vibrating armature, and a pawl pivotally mounted on the end of the armature which is adapted to engage and propel the wheel

596,131. Trolley. Antonio Travaglini, Philadelphia, Pa. Application filed November 13, 1896.

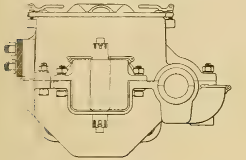
The device comprises a pole, a spindle thereon, a trolley wheel journaled on the spindle, a sleeve carrying a pin slidable on the spindle, and a screw secured to the pole adapted to operate the sleeve.

596,134. Signaling Circuit for Fire and Police Systems. Albert Barrett, Kansas City, Mo. Application filed September 9, 1897.

The box has a door adapted to swing outwardly and provided with a lock, having a concealed circuit-closing pin and springs in the path of the pin, a clock-train is adapted to be wound by the closure of the door and to be released by the opening of the same to serially rotate a brake-wheel and to operate a circuit-closer; telelephone instruments are also provided.

596,135. Securing Device for Covers of Dynamo-electric Machines. Norman C. Bassett, Lynn, Mass. Application filed March 27, 1897.

An inclosing case for a dynamo-electric machine has a removable cover with slotted ends, screw-threaded supports secured to the case, handles pivotally secured to the supports, and laterally projecting cams on the handles resting on the cover adjacent to the slots, so arranged that when the handle is thrown to its open position they are out of the path of the cover so that it can be removed.



NO. 596,135.

596,136. Armature Winding and Coil. Asa F. Batchelder, Schenectady, N. Y. Application filed September 15, 1897.

A coil for a dynamo-electric armature has the sides to be disposed on the armature face united at least at one end by three end portions, two of which are involutes offset from one another, and the third a spiral.

596,152. Detachable Laminated Pole-piece for Dynamo-electric Machines. Henry Geisenhöner, Schenectady, N. Y. Application filed October 11, 1897.

In a revolving field-magnet structure for dynamo-electric machines the combination is claimed of laminated detachable field-poles having split dovetail projections at one end, a support having dovetail slots extending parallel to the shaft of the machine in which the poles are mounted, and wedges for expanding the dovetail projections of the poles.

596,157. Apparatus for Electrolytically Producing Alkalies. James Hargreaves, Widnes, England. Application filed March 16, 1896. Patented in England September 27, 1893.

An electrolytic cell having compartments separated by a diaphragm which, although slightly porous, is impermeable as a filter, an anode, a cathode of open texture, such as wire-gauze, in contact with the face of the diaphragm remote from the anode, and means, such as a steam generator, for supplying steam which becomes condensed upon or for directing a current of steam against the uncovered face of the cathode.

596,160. Electric Heater. Hugo Helberger, Munich, Germany. Application filed April 29, 1896. Patented in Germany June 10, 1894; in England July 13, 1894; in Switzerland October 17, 1895; in Belgium October 29, 1895; in Italy October 31, 1895, and in Hungary November 9, 1895.

The body to be heated is a conductor of electricity with a wire surrounding it, a series of beads of refractory material strung upon the wire and in contact with the body to be heated and a layer of refractory material outside the beads.

596,172. Lead for Electrical Sounding. Julius Mohs, Brandenburg, Germany. Application filed September 3, 1896. Patented in Germany February 23, 1895, and in France December 17, 1895.

It is proposed to employ a pair of contact devices, a shoe pivotally connected to the front end of the body and extending beneath [illegible] and means operated by the movement of the shoe [illegible] a circuit through the contact devices.

596,182. Electric Railway. William B. Potter, Schenectady, [illegible] Application filed November 18, 1896.

Sectional conductors [illegible] switches for closing the circuit between the conductors and a source of supply, means carried by the moving train or vehicle for closing the sections in advance of the train and additional means independent of the switch for closing the circuit between the sectional conductors and the source of supply are here combined.

596,186. Phase Regulator. Charles P. Steinmetz, Lynn, and Edwin W. Rice, Jr., Swampscott, Mass. Application filed September [illegible]

The phase controller [illegible] member connected to [illegible] alternating current circuit [illegible] an induced member [illegible] of relative rotation [illegible] and means for varying the self-induction [illegible] to vary the phase control.

596,190. Induction Wattmeter. [illegible] Thomson, Swampscott, and William H. Pratt, Lynn, Mass. Application filed [illegible] 1897.

A field magnet structure [illegible] frame with poles for the current and potential [illegible] at points [illegible] degrees apart, a cylindrical armature [illegible] magnet structure whose magnetic circuit is completed through certain of the poles on the external frame.

596,197. Electrical Protective Appliance. Arthur S. Williams, Newton, Mass. Application filed August 26, 1897.

The inventor claims a combination in an electro-magnetic appliance of the winding thereof, a mass of easily fusible material contiguous thereto, a sheet metal heat-collector contiguous to the winding and also to the fusible mass, and circuit-changing devices controlling protective connections.

596,201. Electrical Signaling System. John P. Buchanan, Boston, Mass. Application filed December 27, 1893.

A block-signal system is described, having a track circuit and a generator at one end of the block, and being provided with a plurality of relays located at different distances from the generator and adapted to be successively short-circuited through a passing train, and signaling mechanism having circuits controlled by the relays.

596,224. Trolley Rail. William A. P. Willard, Jr., Hull, Mass. Application filed February 12, 1897.

A conductor and a truck normally out of electric contact with it and adapted to have a limited longitudinal movement in either direction into electrical contact with the conductor, the truck being mounted upon rolls and capable of movement upon the contact therewith of a contact shoe.

596,225. Trolley Rail for Electric Roads. William A. P. Willard, Jr., Hull, Mass. Application filed March 5, 1897.

The trolley-rail mechanism described consists of a contact rail suitably supported and capable of traveling longitudinally, and an electric conductor normally insulated therefrom, and means whereby, when the rail travels longitudinally, electric contact will be established between the contact rail and conductor.

596,226. Electric Signaling System. Adoniram J. Wilson, Port Chester, N. Y. Application filed December 21, 1895.

The track is divided into blocks, with track circuits for the blocks, home and distant signals normally at "danger" for the blocks, a home signal and a distant signal being located at the entrance of each block, each home and distant signal having a separate motor peculiar to itself, normally de-energized signal circuits for the signals controlled by the track circuits, the arrangement being such that a train operates the signals in advance to put them to "safety," the train being guarded in the rear by a home signal at "danger" and two distant signals at "danger."

596,229. Underground Junction Box for Electric Conductors. William F. Bossert, Utica, N. Y. Application filed February 17, 1897.

The insulating stuffing-box consists of a body portion, an insulator bushing held therein, a cap, an insulator bushing held therein and an elastic packing between the adjacent ends of the bushings.

596,236. Electric Gas Lighting Device. Adrian L. Bogart, New York, N. Y., and Le Roy S. White, Waterbury, Conn. Application filed May 7, 1897.

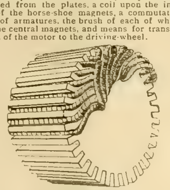
This is an electric gas-lighting and extinguishing device containing a gas-supply controlling valve provided with a stem, an armature secured to the stem, an electro-magnet for actuating the armature to open and close the valve, an igniting tube, an auxiliary gas-supply controlling valve therefor, the auxiliary valve being located in position to be engaged and opened by the armature when the electro-magnet is energized, and a sparking device under the control of the movement of the auxiliary valve.

596,250. Fire Telegraph Repeater. Francis A. Skelton, Newton, Mass. Application filed July 3, 1893.

A supplementary battery and suitable contact devices are connected to the several circuits for connecting the supplementary battery in the circuits successively and momentarily.

596,272. Electric Bicycle. Hosea W. Libbey, Boston, Mass. Application filed November 8, 1895.

An electric battery and a motor comprising a series of straight, parallel, central, permanent field-magnets, having their poles arranged alternately with each other, a shaft having its axis concentric with the magnets, a plate upon the shaft on each side of the magnets, a series of armatures for each plate, each series of armatures consisting of a pair of horse-shoe magnets passed through and insulated from the plates, a coil upon the inner end of each of the horse-shoe magnets, a commutator for each series of armatures, the brush of each of which engages with the central magnets, and means for transmitting the motion of the motor to the driving-wheel.



NO. 596,136.

596,273. Electric Bicycle. Hosea W. Libbey, Boston, Mass. Application filed December 14, 1895.

A portion of the frame is bifurcated and carries an electric battery, with a motor upon each side of the bifurcation of the frame, an axle in the bifurcated portion common to both of the motors, and a bifurcated pitman connecting the crank shaft with the driving wheel.

596,274. Electric Bicycle. Hosea W. Libbey, Boston, Mass. Application filed December 14, 1895.

A frame is provided with a vertical rear fork and a double motor upon the fork, means are also provided for communicating motion from either one or both of the motors to the driving-wheel, a double electrical battery upon the frame and from either of the motors to the driving-wheel of the bicycle in a line with the rear fork.

596,276. Telephoning from Cars in Motion. Hosea W. Libbey, Boston, Mass. Application filed April 6, 1897.

One claim is given: In a railroad car wheel having a ring of conducting material let into the edge of its flange but insulated therefrom, and a ring of conducting material attached to the inner side of the flange but insulated therefrom.

596,283. Electric Current Meter. Reginald P. Wilson, London, England. Application filed March 24, 1897.

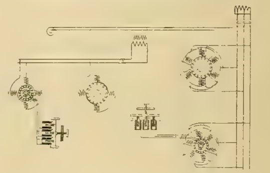
A device for automatically changing the position of the indicator (showing the price charged when the clock stops) and brought into operation by the stopping of the clock consisting in the combination of two oscillating bodies interconnected by a pin-and-slot device and a spring contact, and working differentially so long as the clock is in motion, an indicator free of the oscillating device so long as the clock goes, but electrically operated by the closing of circuit through the spring contact immediately upon the stoppage of the clock.

596,306. Dynamo-electric Machine. Pomeroy W. Power, Pittsfield, Mass. Application filed February 12, 1896.

The machine has a rotating inductor and laminated polar projections separately fastened to the inductor core by dovetail fastenings.

596,320. Printing Telegraph. Byron A. Brooks, Brooklyn, N. Y. Application filed August 11, 1894.

A line wire and electric switches connected in series in the line are employed, and means are provided for sending a characteristic succession of impulses over the line and through the switches successively, whereby a final impulse is transmitted directly to a magnet controlling the corresponding printing mechanism.



NO. 596,186.

596,356. Electric Call Box System. William T. Budds, Charleston, S. C. Application filed July 14, 1897.

An electric call-box is described, comprising a motor, a circuit-controlling wheel operated by the motor, a segmental block of insulating material on one side of the wheel, a metallic plate on the block and insulated from the body of the wheel, brushes normally resting on the plate and having connection with the line wires, and a ground wire having connection with the body portion of the wheel.

596,363. Quick-break Switch. Ralph C. Demary, Buffalo, N. Y. Application filed August 2, 1897.

Circuit terminals are mounted on a base; a switch-blade is pivotally secured to one of the terminals and co-operates with the other; a handle is pivoted to the first-named terminal and movable independently of the switch-blade; a spring connection is provided between the switch-blade and the handle; a swinging locking lever is pivotally secured to the base; a latch is secured to the switch-blade and insulated therefrom, the latch engaging with the locking-lever when the switch-blade is in its normal or closed position, and means are provided for disengaging the locking-lever from the latch when the tension of the spring is approximately at its maximum.

596,418. Magneto-electric Signaling Apparatus. Arthur S. Williams, Newton, Mass. Application filed June 5, 1897.

A key or press-button and a motor spring are adapted to successively move the armature in opposite directions respectively, and a detaining device controls and acts to delay the operation of the spring, and itself is controlled by the press-button.

596,439. Take-up for Controlling Slack of Trolley Ropes. Howard E. Adt, New Haven, Conn. Application filed May 10, 1897.

Claim is made for the combination with two spool-frame brackets permanently located upon the ends of a trolley car, of a two-armed spool-frame adapted to be detachably connected with either one of the brackets according to the direction in which the car is to be run, a non-rotatable spool-shaft mounted in the arms of the frame and formed with a longitudinal slot, a chambered spool mounted upon the shaft so as to rotate thereupon and adapted to have the lower end of a trolley rope attached to it, a spring located within the chamber of the spool and encircling the spool-shaft, a collar located in the inner end of the chamber, having the inner end of the spring connected with it and mounted upon the inner end of the shaft upon which it has lateral but not rotary movement, and a removable disk-shaped plate secured to the outer end of the spool, affording a bearing for the outer end of the shaft, and having the outer end of the spring connected with it.

596,456. Trolley for Electric Railway Cars. Edward Cone, Chicago, Ill. Application filed December 11, 1896.

A trolley pole is provided with a rotatable trolley wheel at the upper end thereof, guard mechanism pivotally mounted at each side of the trolley wheel and having substantially vertical and horizontal portions independently and pivotally mounted, means for normally holding such portions in their vertical and horizontal positions, and spring mechanism for keeping them in their closed position and permitting a separation of the parts when obstructions are met.

REISSUE

11,645. Signaling Circuit. Joseph J. O'Connell, Chicago, Ill. Application filed October 20, 1897. Original No. 555,707, dated March 3, 1896.

The first claim is given: The combination of an electric circuit with a key which, when manipulated, disconnects the normal terminal devices of the circuit conductors and connects one of the said conductors with a grounded call branch, including an electric generator and an electro-magnet, and at the same time connects the other side or conductor of the circuit with the ground; means for automatically locking the key when it is manipulated, means for automatically releasing it from a distance, and means associated with the said key also for manually releasing the same.

Western Electrician.

EVERY SATURDAY.

Vol. XXII. CHICAGO, JANUARY 15, 1898. No. 3

Electrical Plant in the Alexian Brothers' Hospital.

Plain and rather severe in exterior design, the large new building of the Alexian Brothers' Hospital at Racine and Belden avenues, Chicago, is nevertheless very completely fitted with all the requirements demanded by modern science to make a safe, cleanly and healthful home for the sick and injured. The building is pleasantly located and is surrounded by rather extensive grounds that are to be set out with trees, shrubbery, flowering plants and green sward, and which will in time form a pleasant retreat, with summer-houses and arbors, for convalescent patients during warm weather.

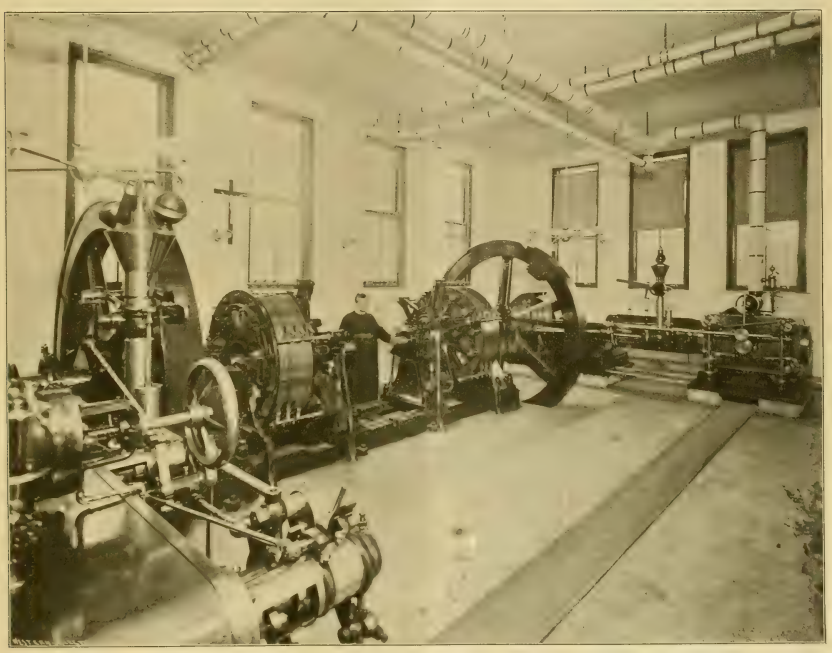
The exterior walls of the hospital are of pressed brick, and the building is substantially built about a central court. It is designed to be fireproof and to be in all ways practically adapted for the work in hand, without show. Wisely enough, the brothers in charge decided to spend their available funds in erecting as good a hospital as could be built for the money instead of lavishing it on architectural ornamentation. One noteworthy feature is the pains everywhere taken to insure absolute cleanliness. As far as possible all lodgments for dirt are obviated. There are no sharp angles to accumulate dust unseen; there is no material in floor or wall that cannot be easily and effectually cleaned. The hospital can accommodate 250 patients and is, of course, provided with all necessary departments—offices, waiting rooms, general wards, private rooms for patients, surgeons' operating rooms, nurses' quarters, kitchens and dining rooms, storerooms, morgue, etc. In addition, there is a pretty little chapel and a portion of the building styled the Brothers' House, where there are living accommodations for 60 of the lay brothers. At present the hospital shelters 40 brothers and four postulants, and Brother Aloysius, the provincial of the order, says that "they are all hard workers." A picture of the hospital is given on the next page. Richard E. Schmidt is the architect.

In this fine institution the mechanical and electrical plant has been carefully planned and is of unusual interest. The systems of heating, lighting, ventilation, power, communication and refrigeration are in each instance of a modern and improved type and thoroughly worked out. An intelligent and comprehensive use is made of electricity, and several views of the plant are given on this and succeeding pages.

Crude petroleum is burned as fuel under the boilers. The oil itself is not cheaper than coal, but it is well suited for use in an institution of this kind, as there is no dust, dirt or refuse in handling it. In addition, there is the advantage that no labor is required in the removal of ashes. The boiler room, illustrated on page 34, is a clean, light and airy apartment on the ground floor. It contains two water-tube Root boilers, made by the Abenroth & Root Manufacturing company of New York, each of a capacity of about 160 horse power. The boilers are equipped with Hoppes feed-water purifiers and rocking grates. The latter are so arranged that in case of an emergency the oil burners can be quickly pulled out and the boilers fired with coal, of which a small supply is carried. One boiler is ordinarily sufficient to carry the load; the the other is held in reserve. The Warren Webster vacuum system of heating by exhaust steam is employed. Atmospheric pressure is used, so that there is no back pressure on the engines.

Adjoining the boiler room is a well-arranged room for the pumps, feed-water heaters, oil tanks and other auxiliaries. The steam pumps are mostly of the Worthington type. This room is illustrated on page 35.

The generating plant shown by the picture on this page, is placed in a well-lighted corner room. It consist of two engine-dynamo units in duplicate. The engines are of the single-cylinder, slow-speed, horizontal, Corliss type, and operate at 90 revolutions per minute. At that speed, with one-fifth stroke cut-off and a steam pressure of 80 pounds they are rated at 65 horse power each. They were built by the Filer & Stowell company of Milwaukee. Directly coupled to the shaft of each engine is a Siemens & Halske multipolar, 120-volt compound wound, 60-kilowatt dynamo of the external commutator design familiar in larger power generators. These dynamos are driven at 90 revolutions per minute, of course, and are the first of this slow speed type built of this small size. They are guaranteed to have an efficiency of 93 per cent, and to run for two hours at an overload of 25 per cent. They rest on a planed rail runway in such a manner that the armature and commutator can easily be rolled to one side, exposing the field coils. The switchboard, when completed, will be of marble, and will have Hull switches and Weston instruments. It is designed by the superintendent.



ELECTRICAL PLANT IN THE ALEXIAN BROTHERS' HOSPITAL.—ENGINES AND DYNAMOS.

gineers, Pierce & Richardson, to have a double bus-bar system—one pair for light and one for power circuits. Thus, at periods of heavy load one generating unit can carry the lights and the other the motors—an arrangement of obvious advantage. However, a 600-ampere switch is provided to connect the two bus systems when desired, so that one or both units may carry the load. Each of the eight circuits leaving the board will be provided with a Cutter automatic circuit breaker.

All the wiring throughout the building is in iron conduits. The structure is divided into five sections for lighting, with a riser for each. One unusual feature of the wiring is the fact that each of these risers consists of the same sized cable from

ALEXIAN BROTHERS' HOSPITAL.

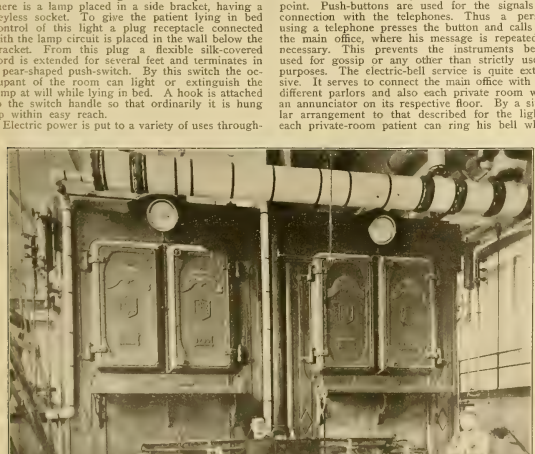
bottom to top, through the four stories. This method of distribution permits of very slight variation in voltage between the lamps on the ground level and those on the topmost floor. Each cut-out cabinet is provided with a double-pole switch for each circuit. The wiring system is planned for about 1,000 lamps of 16 candle power each. In the chapel a number of lamps are concealed behind stained glass windows and there is a 60-ampere dimmer to soften the light. In each private room there is a lamp placed in a side bracket, having a keyless socket. To give the patient lying in bed control of this light a plug receptacle connected with the lamp circuit is placed in the wall below the bracket. From this plug a flexible silk-covered cord is extended for several feet and terminates in a pear-shaped push-switch. By this switch the occupant of the room can light or extinguish the lamp at will while lying in bed. A hook is attached to the switch handle so that ordinarily it is hung up within easy reach.

Electric power is put to a variety of uses throughout the building. It is used to drive ventilating fans, to operate the refrigerating plant and to keep up a constant circulation of cold water and to drive elevators. For the first two mentioned four motors aggregating 36 h.p. power are installed in the attic, where they are belted to the fans which assist the circulation of air through the building. Three motors are also used in the refrigerating department. A picture of one is shown on page 35. This is a Holtzer-Cabot motor of about 20 horse power which drives a Linde ice machine made by the Fred W. Wolf company of Chicago. The picture shows the motor and its starting-box, the ice-machine and the gauge-board connected with the latter. In the same room a 1½ horse power motor drives a brine pump used in connection with the artificial-ice chamber, and another of the same size will operate a circulating pump which will keep the supply of drinking water for the hospital constantly cold by pumping it through a tank containing a coil of pipe filled with ammonia. The water for drinking is first sterilized by heating it to a temperature of 214°. It is then cooled to 34° in the tank mentioned and sent through the piping system, from which, at 16 taps in different parts of the building, pure, cold water can always be had for drinking.

The electric passenger elevator was installed by the Crane Elevator company. It has a capacity of lifting 2,500 pounds 150 feet a minute, and is operated on a separate circuit from the switchboard of the generating plant. The motor takes 130 amperes at 110 volts and is placed, with the operating mechanism, in the attic, at the top of the shaft. The elevator is equipped with all modern automatic safety appliances and is arranged to stop automatically at the first floor and the top floor. A patent flattened-strand Swedish iron hoisting rope, with hemp core, connects the car with the drum.

A dumb-waiter runs from the basement to the attic through a hatchway three by four feet, and is electrically operated also. A two horse power medium-speed motor in the attic supplies the power. By an ingenious combination of elevator controller and an automatic motor starter the outfit is so arranged that by giving a pull on the tiller rope the cage may be either started, stopped or the motion reversed. The car stops automatically at the top and bottom floors. All of the motors except that for the elevator were installed by E. R. Harding, who also put in the apparatus for controlling the movement of the dumb-waiter.

The means of inter-communication between different parts of the hospital include a speaking-tube system, electric-bell service and an equipment of 18 telephones. All of the telephones are connected with the main office, but are not arranged to be inter-connected by a switchboard at that point. Push-buttons are used for the signals in connection with the telephones. Thus a person using a telephone presses the button and calls up the main office, where his message is repeated if necessary. This prevents the instruments being used for gossip or any other than strictly useful purposes. The electric-bell service is quite extensive. It serves to connect the main office with the different parlors and also each private room with an annunciator on its respective floor. By a similar arrangement to that described for the lights, each private-room patient can ring his bell while lying in bed. The bell-pushes are also provided with hooks. They are distinguished from the switches for the lamps by a different colored cord.



ELECTRICAL TESTING IN THE ALEXIAN BROTHERS' HOSPITAL—BOILERS.

The Chicago City Council, on motion of Alderman Kahler, has passed an ordinance directing the mayor to appoint a committee to investigate the Garfield Electric Light company and see whether it has forfeited its franchise.

A Year's Electrical Exports.

The Treasury Department has completed the computation of the statistics covering the exports and imports during the last fiscal year. Hon. Worthington C. Ford, the head of the division which is entrusted with the preparation of these statistics, says that there is no branch of government statistics which more nearly affects, as well as interprets, the welfare of the American people, than this annual compilation on the commerce and navigation of the United States.

Mr. Ford declares that the exports of our manufactures have never been so large as they now are, and it is doubtful if they have ever increased so rapidly as they have in last few years. This has been accomplished in the face of the obstacles created by conditions of competition.

These statistics are interesting, because they show, the customs districts from which the articles were exported, the value of the exports from each district, the countries to which the exports went, and the volume and value of the goods sent to each foreign country.

The statistics which relate to the exports and imports of electrical apparatus constitute a highly interesting exhibit to the manufacturers and dealers in these lines.

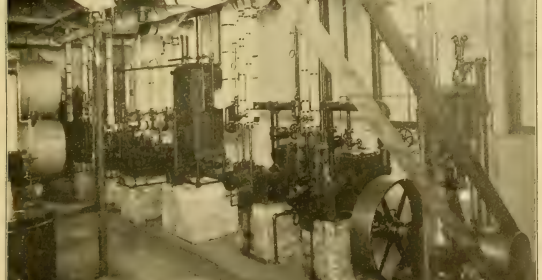
A Royal Electrician Coming.

The lady who chats about "Queer Sprigs of Gentility" in the Chicago Record over the signature of Marquise de Fontenoy, announces that King Humbert's only son, according to gossip among the Roman entourage of King Humbert and Queen Margherita, intends to visit the United States incognito early this spring, possibly a few weeks hence. The purpose of his crossing the Atlantic is not to become acquainted with the country, but merely to make a sort of pilgrimage to Menlo Park, and it is doubtful if he will go even to Washington. In fact, he is undertaking the journey to America with the sole object of visiting Edison at his home—that Edison for whom he has the most profound admiration, and who doubtless will be the recipient of the highest honors in the gift of the Italian crown when the prince comes to the throne.

Humbert's son and heir is passionately fond of electricity. He never has occupied himself much with art or literature, but he is a master of the science of electricity, and is acquainted with well-nigh everything that concerns its application to light, motive power, sound and photography. He was one of the first and most sucessful experimenters with the X-rays after their discovery, and his apartments in the Palazzino at Florence, which has been his home until now, bore the aspect of a scientific library. He may boast of being the one real practical electrician among all the royal personages of Europe. For, curiously enough, not one of them, with the exception of himself, seems ever to have devoted any attention to this branch of science, or to have made of it a hobby.

The prince will not impress people in the United States by the majesty of his appearance. He is very, very short, standing scarcely five feet in his boots. His face is the reverse of comely, and like all very small men, he has a keen sense of his own dignity, and endeavors to repress any tendency to



ELECTRICAL PLANT IN THE ALEXIAN BROTHERS' HOSPITAL.—PUMPS AND STEAM AUXILIARIES.

merriment due to his odd appearance by a particularly stern look and a very imperious manner. Indeed, there is no royal personage in Europe who is so very "stand off-ish" as the Prince of Naples, except when he happens to be with persons who possess the same eccentric traits as himself, when he loses all his self-consciousness and becomes the most charming and interesting of companions.

Northwestern Convention at Milwaukee on Wednesday, January 19th.

From present prospects the Northwestern Electrical association's convention at Milwaukee, beginning Wednesday next, bids fair to be one of the best, if not the best, in the history of the association.

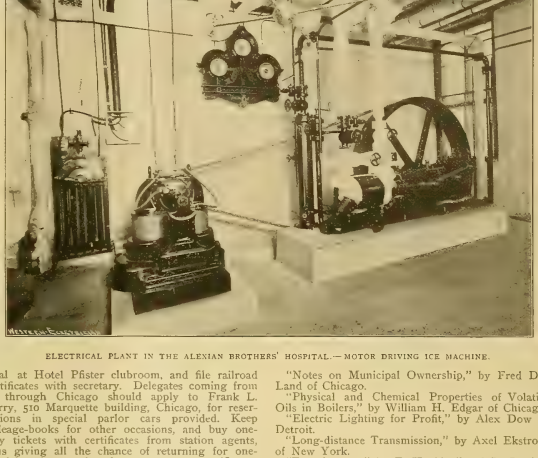
Secretary Mercein has issued the "last call" as follows: "Don't fail to be in Milwaukee on Wednesday morning, January 19th. Register on arrival at Hotel Pfister clubroom, and file railroad certificates with secretary. Delegates coming from or through Chicago should apply to Frank L. Perry, 510 Marquette building, Chicago, for reservations in special parlor cars provided. Keep mileage-books for other occasions, and buy one-way tickets with certificates from station agents, thus giving all the chance of returning for one-third fare, by securing the necessary 100 certificates. A large attendance is expected. The theater party will be on Wednesday evening, and the banquet on Thursday evening."

Arrangements have been made with the Chicago, Milwaukee and St. Paul Railway company to have special cars for the delegates, leaving Chicago at 8.30 a. m., from the Union depot, next Wednesday morning, January 19th, and it is hinted that there will be a special attractive feature on the train Chicago delegates and those intending to go to Milwaukee via Chicago will therefore undoubtedly prefer to go with the Chicago party on the Wednesday morning train. The fare to Milwaukee one way is $2.55.

The following list of papers has been prepared for the convention:

"Practice of Theory." by John C. McMynn of Chicago.

"Present Efficiency of Incandescent Lamps," by John E. Randall of St. Louis.



ELECTRICAL PLANT IN THE ALEXIAN BROTHERS' HOSPITAL.—MOTOR DRIVING ICE MACHINE.

"Notes on Municipal Ownership," by Fred DeLand of Chicago.

"Physical and Chemical Properties of Volatile Oils in Boilers," by William H. Edgar of Chicago.

"Electric Lighting for Profit," by Alex Dow of Detroit.

"Long-distance Transmission," by Axel Ekstrom of New York.

"Transformers," by E. H. Abadie of St. Louis.

Secretary Mercein also announces that he has received assurances from Prof. R. B. Owens of the State University of Nebraska that he will present a paper upon "Electricity in Municipal Engineering." This completes the list of contributions for that event.

The committee on entertainment, which is composed of James M. Hill of Chicago, W. L. Church of Milwaukee and Charles Cuno of Oconomowoc, has arranged a very attractive programme of social features. Mr. Mercein has been selected to preside at the banquet, which will be sufficient to assure the members of a highly entertaining evening.

Warping of the Eiffel Tower.

At a recent meeting of the French Academy of Sciences, says l'Energie Electrique, Col. Bassot read an interesting paper tending to establish the fact that the great French tower has a daily movement of considerable magnitude.

Col. Bassot explained, in effect, that the expansion of the metallic components of the structure produced a torsion movement from sunrise to sunset, which traversed a curve of 10 centimeters. This movement is repeated in an inverse direction during the night, as the column becomes cooled, so that the lightning rod on the summit of the tower is in constant motion.

Col. Laussedat, director of the Conservatory des Arts et Metiers, was appealed to for confirmation of Col. Bassot's statements.

"I have carefully followed the investigations of Col. Bassot," he said, "and the results given are perfectly exact. I cannot give the figures off-hand, but his work in this line is faithful and excellent, and extends over a period of 10 years of patient and interesting study. The laws of the expansion and contraction of iron by heat and cold are well known, and the tower simply obeys the physical law of temperature influence. In summer the expansion is superior to that in winter, and the movement reverses at night, owing to contraction, due to the cooling down of the iron. Yet, as Col. Bassot has stated, this twisting, this torsion, will in no case compromise the solidity of the structure, which is absolute. The constructors had, at the time of erection, all this in view, and calculated for it so that while the matter is one of interest, it is neither startling nor, from a methematical point of view, of serious importance.

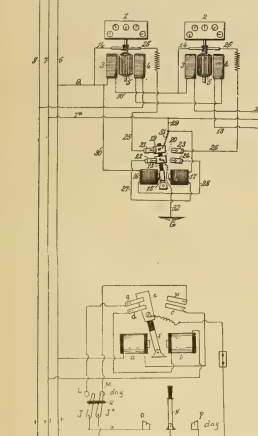
The Casselton, N. D., electric light plant is soon ready for operation

Multiple-rate Metering.

By Eustace Oxley.

Since completing the article relating to double-rate metering (published in the Western Electrician last week), the author's attention has been directed to inquiries concerning several points which it was thought unnecessary to consider in the space at his command. These questions relate, in part, to that form of the system in which a ground circuit is used, and as economic construction will award this form the preference, as it entirely dispenses with a separate metallic control circuit, and thus avoids the expense of tearing up pavements to lay it, it seems essential to point out the only difficulty that has been suggested to the writer, and to describe briefly the very simple means by which this difficulty, which has been anticipated, is entirely removed.

Wherever the ground circuit is used, it is evident that an accidental ground at any point upon the system may operate every controller, and, by prematurely throwing the armature bar over toward the magnet energized by the circuit that is closed through such an accidental ground, the meter registration at every point will, from that moment, be at the wrong rate. Unless this disturbance is corrected without delay, the results may be serious. If the ground occurs during the low-rate period the consumers are the sufferers, for



MULTIPLE-RATE METERING.

a comparatively short period might be enough, where current is used for power, to largely affect the monthly bills. But the generating company, while an involuntary gainer in a monetary sense, may lose even heavily in the diminished confidence of the consumer, and is fortunate if it escapes strong suspicion of having employed dishonest method.

To effectually guard against all objectionable results, possibly from such disturbances by automatically restoring the controllers to the condition that corresponds to the rate the meters are registering, when the ground occurs, a very simple apparatus is placed at the central office at any convenient point. It is shown in the accompanying diagram and consists of electromagnets a and b, the first terminal of the magnet a being connected to the positive side of the system and the second terminal carried to a clip c. The first terminal of the magnet b is connected to the neutral and to a clip d, lying opposite the clip c. Between these clips is a single knife e, carried by an insulated bar supported by the armature f. Upon the same axle with the bar f is a clip g, to which is attached a similar clip h, so arranged that, when thrown by the electro-magnets, the knife will enter both clips on the side to which it is thrown.

At a convenient point is a switch consisting of two arms, j, ja, pivoted at one end, and connected by a pivoted, insulating bar k. Thus, when moved in unison, one arm may be placed on a contact l, and the other removed from a contact m, or vice versa. The small, single-pole, double-throw switch, the arm n being preferably held by a spring out of its clips o and p, is the control which used at the central station. Its clips are connected to the positive and neutral by wires q and r respectively.

It will be noticed that the apparatus bears striking resemblance to the controllers. Its construction is varied but slightly, and there is no increased complication. The operation is as follows:

As shown in the diagram, the controllers have brought the day-rate into registration. This has been done by first moving the connected arms j ja, to the position shown, and then closing the arm n in the clip p. Upon releasing this arm it is thrown out of the clip, as shown, by a spring or other suitable device. This was completed by it has not only operated all the controllers on the system, but has also energized the magnet a and thrown the knife e into the clips g and d.

It will be seen that controllers were last operated from the neutral side of the system, and therefore, should a ground occur upon either the positive or negative, the magnet b will be energized, drawing the knife e out of the clips in which it lies and into the opposite clips. As it does so the positive is again grounded, and all the controllers are restored to their original position. As the ground is of short continuance, the knife e is automatically restored to the position shown in the diagram. As some of the controllers may be sluggish, it is well to retard the movements of this knife by a dash-pot, or other suitable means, to give time for the complete restoration of all.

An advantage is obtained by switching the controller-switches for 200 volts. Not only do they then require less current for their operation, but they are controlled from the central station by grounding either the negative or positive side of the system. A ground on the neutral, therefore, as it results in 100 volts only, does not affect the controllers, such a pressure being insufficient for their action. Thus, disturbances due to accidental grounds upon the neutral are excluded. Moreover, if a ground occurs on the side from which the controllers were last operated, no disturbance can result. The liability of such disturbances is thus greatly reduced. When they do occur, the results that follow will be instantly corrected, in the manner and by the means described.

Chicago Electrical Association.

The Chicago Electrical association held its first meeting of the year on Friday evening, January 7th, at 1737 Monadnock block. The paper of the evening was read by H. G. Dimmick of the Western Electric company, on "Electrical Shop Transmission." The writer, who has had considerable experience in the electric power transmission problem at the factory of the Western Electric company, treated this subject in a very practical way and made many suggestions which might prove of value to the practical engineer. He spoke of the importance of having a well-designed switchboard, so that any and all circuits are under the control of the man at the source of supply. He advocated the use of iron-armored conduit for running rubber-covered cable, and the use of iron pipes in which to run lead-covered cable. One great problem in electric shop transmission is the difficulty to get satisfactory automatic motor-starting boxes—boxes that are sure to open the circuit on the motor every time when trouble in the line. Most boxes, although they may operate very well when they are new, after having been used for a time, become gummy and stick, making them useless.

Mr. Hicks followed, and described the requirements of the modern motor used in shop transmission of power. The motor of to-day must be able to operate at variable speeds, and from a light load to a heavy load without sparking and without brush movement. It must also be dust-proof and so designed as to operate without much heating.

Mr. Sewell and Mr. Wiler took part in the discussion.

The association has bright prospects for the year. The membership is growing, and the work of the association is of constantly increasing importance. The new officers for the coming year are: President, C. S. Hickok; vice president, T. G. Grier; secretary, J. R. Cravath; treasurer, E. J. Swartout; directors, S. G. McMeen, J. M. Hallsted, and C. Wiler.

The next meeting of the association will be held on January 21st, when a paper will be read on "The Art of Constructing Telephone Apparatus," by H. P. Clausen of the Western Telephone Construction company.

The British Post Office, after a series of elaborate experiment, has at length adopted motor cars for use not only for the conveyance of letters, but also of parcels sent by mail in the metropolitan district, as well as in the principal cities of the United Kingdom. The innovation is pronounced a great success, and is giving much satisfaction.

Electric Switching Locomotive in Hoboken.

Latest among the heavy-duty railroads to adopt the electric switching locomotive is the Hoboken Railroad, Warehouse and Steamship Connecting company which operates the Hoboken Shore road in Hoboken, N. J. The line runs from Seventeenth street, Weehawken, to Fourth street, Hoboken, along the water front, or from the Erie tracks at Weehawken to the docks of the North German Lloyd Steamship company, Hobcken, a distance of about two miles. It was opened for traffic on September 20, 1897. It was constructed to provide connecting facilities between the tracks of the railroad companies entering Hoboken and the numerous warehouses and docks which line the west side of the North River from Hoboken to Weehawken. It is double-track over a private right-of-way from Seventeenth to Fourteenth street, single-track down Hudson street to Eleventh street and double-track along the river walk to Fourth street, Hoboken.

The switching of the cars for the last three months has been effected by a repair car of the Hudson County Electric Railroad company. The new locomotive was put into regular service on Tuesday of last week hauling trains of loaded and empty freight cars between the docks and the Erie track. The difference in its operation from that of the ordinary engine is immediately noticeable. The electric locomotive responds instantaneously to the movement of the controller handle and starts without jerk or noise, tightening up the couplings uniformly or coupling the cars together so gently that no blow is perceptible.

The locomotive (Fig. 1) was constructed in the shops of the General Electric company, at Schenectady, N. Y., and somewhat resembles in appearance the electric locomotive in use on the Manufacturers' railroad, which connects with the New York, New Haven and Hartford railroad tracks at New Haven, Conn., and the larger locomotives now handling the entire freight traffic of the Baltimore and Ohio railroad through the Belt Line tunnel at Baltimore. It is mounted on two four-wheel trucks, each axle carrying a "G E 2000" motor, giving the locomotive a total of 540 rated horse power. The weight on the drivers is 57,200 pounds; the drawbar pull is 10,000 pounds. The locomotive is driven through a single-reduction gear of very low ratio. The speed is correspondingly low, and is rated at eight miles an hour when hauling a heavy load.

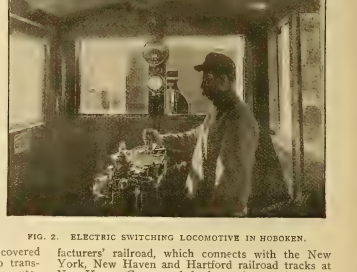


FIG. 2. ELECTRIC SWITCHING LOCOMOTIVE IN HOBOKEN.

At each end of the locomotive is an automatic coupler and a small railed platform for the brakeman in charge of the trolley pole. The car is of iron and resembles a double steam locomotive cab, with a sloping tender shield at each end. Drop windows are set around the four sides of the cab, affording an unobstructed view in all directions to the motorman. A sliding door on each side gives admission to the locomotive. The interior of the cab (Fig. 2) is lined with cherry and is a spacious and well-lighted room. The fittings are all of polished brass or nickel. On each shield is a headlight; in addition one shield carries a bell, the other a chime whistle. Beneath one of the shields are four packed-card resistances, two sand boxes, the compressed-air tank and the equalizing-air tank; beneath the other eight resistances, two sand boxes and the engineer's tool box. At one end of the cab is placed a controller of the series-parallel type known as the L 2, arranged to operate the motors either four in series or each two in series-multiple. Beside the controller is the air-brake handle and the two valves of the sanding arrangement by means of which the sand is blown by the compressed air under the wheels.

In front of the motorman is an air-brake gauge and above it an ammeter reading to 500 amperes. Fastened to the roof of the cab is an automatic circuit breaker set at 500 amperes. On the other side of the controller from the motorman is another circuit breaker and an automatic governor

switch for the air pump, placed at the other end of the cab. This is a single-cylinder pump driven by a three horse power iron-clad bipolar slow-speed motor. The operation of this air pump is automatic. When the air in the tanks is at normal pressure the governor switch is opened. Blowing the whistle, applying the brakes or using the sander causes the pressure to fall. This closes the switch automatically and starts the motor and pump. The cab is lighted by five standard Edison railway incandescent lamps.

The dimensions of the Hoboken locomotive are: Length over all, 29 feet; width, eight feet; height over trolley stand, 13 feet; wheel-base, five feet six inches; truck centers, 12 feet 9 inches; weight, 57,000 pounds.

The No. 00 overhead wire is suspended from wires strung between octagonal cedar poles, except at two or three points, where bracket construction is used. When the locomotive turns in from Hudson avenue to the River Walk, a peculiar condition has caused a special method of bracket construction. It was necessary for the overhead line to be so set as not to infringe upon the limit of the next property. Thus at this point the overhead line is suspended from two bracket arms, one six feet and the other 18 feet long. The current for the road is taken from the station of the Hudson Electric Light company.

The trial trip of the Hoboken electric locomotive as witnessed by representatives of all the railroads having offices or termini in New York and New Jersey. The locomotive was coupled to eight loaded freight cars with an aggregate dead weight of 295⅝ tons. It handled this train with ease. It was then coupled to a number of passenger coaches and the party made the journey over the line from Hoboken to Weehawken and back.

At the luncheon which followed, two interesting

a pace on acceleration that would not have been dreamed of two years ago, and the schedule which he has mapped out for the contemplated electrical equipment of the suburban lines of his company involves a rate up to 40 miles per hour in 20 seconds. That this is practical has already been demonstrated. In fact so high a rate of acceleration has been made as 43½ miles per hour in 20 seconds, so that the practicability of Mr. Lundie's plans have been thoroughly demonstrated. This for passenger service.

"In another direction even greater changes may be prophesied as coming from the adoption of electricity in standard railroading; that is, the lengthening of freight trains and the consequent reduction in that most important feature of operating expense, transportation wages. The advantages of electricity will have so thoroughly demonstrated themselves in the directions suggested that instead of main steam lines with electric feeders, in 10 years it will be a question of electrically operated main lines with steam feeders through the sparsely settled districts, and a more extended system of suburban and interurban electric roads in densely populated districts also feeding the main lines.

"The electrical engineer has much to learn from the steam-railroad man and must constantly rely upon him for suggestions as to the best methods of making practical applications of electricity. The American transportation man and the American electrical engineer should go on hand in hand, continuing to lead the world as they do now in all transportation problems. The American engineer has won conquests abroad as well as at home. Not the least is the solution of the problem of electrical equipment for the Central London Underground railway, the most important of this character that has yet been accomplished. The American engineering plans were selected on account of their

FIG. 1. ELECTRIC SWITCHING LOCOMOTIVE IN HOBOKEN.

speeches were made. Mr. F. Le Bau, general freight agent of the West Shore railroad, pointed out emphatically the usefulness of such a road as the Hoboken Shore Road in facilitating the transport of merchandise directly from the steamships to any part of the country, and of the rapid-switching electric locomotive, by means of which the freight cars could be handled more easily and more expeditiously than with the ordinary steam-drill engine. Mr. W. J. Clark, general manager of the railway department of the General Electric company, in an interesting talk full of reminiscences of the early days of the street-railway struggle, said:

"Ten years ago the development of three things made electric street railways practicable and profitable. These were the underrunning trolley, the carbon brush and the modern method of motor suspension. The development of three other things now renders the general application of electricity to standard railroads both possible and probable. These are the safe breaking of heavy currents, high voltage for their transmission and methods for their application to almost any load on any portion of a line. Other features are being developed that will seriously affect the result; not the least is the Sprague system of multiple and unit control, increasing the flexibility of the already most elastic of all transportation agents, and while the economy of electricity has already been thoroughly demonstrated in performing the same service as by steam or animal traction, so far as passenger service at least is concerned, something beyond the mere question of economy has now to be considered; to wit, accomplishment by electrical methods of what would be entirely impossible with steam. The first steam railway man within my range of acquaintance to fully grasp this idea is Mr. John Lundie, consulting engineer for the Illinois Central Railroad company, who has set

merit, in the face of the severest competition from every European electrical manufacturing company, and no greater tribute can be paid to American engineering methods than to state that 80 per cent. of all the electrical railway apparatus used in Europe is designed in America so that the American engineer stands to-day head and shoulders above those of any other country. With the encouragement of the co-operation of American railroad men he is bound to revolutionize the entire method of transportation within a comparatively short space of time, so that American railroad methods will then, as now, be in advance of those existing anywhere else on the face of the earth."

The Electric Light in Port Arthur.

This is the way the Port Arthur (Ont.) Herald speaks of that town's electric light system: "The General Electric company sold the town a lighting system, and installed it in May last. The old thing worked fairly well for several months, and then came a burnout and the town was in darkness for a night. Superintendent McCauley repaired the damage to the armature, and away went the thing spinning at the rate of a good many hundred revolutions to the minute. And so it spun for a comparatively few nights, when a second burnout occurred—in a new place. Once more the damage was repaired, and away went the machine for a short time, when a third burnout happened. Three burnouts in 40 days rather dazed the management and they telegraphed the company at Toronto a gigantic kick. An expert was immediately sent. He arrived, looked over the machine, shook his head and went for a new armature said something about crystallized wires, nodded his head sagely, said it was all right and took train for home."

A Great Light.

[From the New York Sun.]

"The lightning light," the huge bivalve lens which was exhibited at the World's Fair by Henry Lepaute of Paris, France, and was purchased for $10,000 by the Lighthouse Board and has since been on exhibition at the expositions at Atlanta and Nashville, is now [December 28th] undergoing a 10 days' test at the general depot of the lighthouse establishment at Tompkinsville, S. I. If this exhaustive test is successful, the light will probably be installed at some point along the coast, though its exact location has not yet been decided upon.

The lenses of this light are nine feet in diameter. Each is composed of a central disk, two prismatic rims, and 190 prismatic segments of rims, all of carefully ground optical glass. The prisms of each lens are mounted in a brass framework made in 19 sections. The light is furnished by a specially designed electric arc, and there are three lamps. Two of them are interchangeable by simply turning a hand-wheel, and the third can easily be substituted for either.

The lamps have interchangeable carbons of different sizes, so that the light can be varied in intensity, according to the condition of the atmosphere. With carbons one inch in diameter, the light is equal to from 8,000 to 10,000 standard candles. Each lens gathers nearly a half of this light and projects it in a beam nine feet in diameter, which has an estimated intensity of 90,000,000 candles. Such a light on a lighthouse high enough could be seen 100 miles away, and in actual use it can be located at a still greater distance by its reflection on the clouds. The light and lenses revolve six times a minute, so that a beam from one of the lenses is flashed in a given direction once every five seconds. The lamp, the lenses, and the supporting framework weigh 20 tons. They are supported by a hollow steel cylinder floating in mercury, and so slight is the friction that one may revolve the whole mass by pushing with a finger. The regular revolving mechanism is a clockwork driven by a falling weight of 100 pounds.

The lamps have an automatic feed, which keeps the arc in the focal center of the two lenses. The current to run one is of 55 volts, and its amperage varies from 25 to 100, according as carbons of one-half or 1½ half inches in diameter are used. The French generator and engine made for the outfit were not purchased, as domestic machines were thought to be as well fitted for the work. Two General Electric alternating generators, driven by a 25 horse power Ideal engine, and Fitzgibbons boilers will constitute the plant. Everything is in duplicate in case of a possible accident.

Access to the space between the lenses is by iron steps at one side of the heavy pedestal of the light. At the head of these steps is a grating which, when opened to allow one to ascend, automatically stops the revolution of the light. The lenses are over four feet apart at the center and one standing in the space between them, which from inside, has the appearance of being completely surrounded by solid glass, is dazzled by the brilliance of the light they transmit from the outside. At night, and with the light burning, the effect is far more bewildering. From without one cannot look at the flash of the lenses at short range. It hurts the eyes, even when closed. A captain in the lighthouse service says he can read a newspaper at Ridgewood by the light from Staten Island.

The tests are being conducted under the supervision of Lieut.-Col. D. P. Heap, corps of engineers, U. S. A., engineer of the Third Lighthouse district, and C. A. Lamy, superintendent of the depot. One criticism so far made is on the use of mercury for the bearing. There are on the floor above the big light two smaller ones mounted in mercury, and the other on a ball bearing, designed by Lieut.-Col. Heap, and while the one in mercury, though it weighs only 300 pounds, moves no more easily than the 21 ton below, a mere breath will revolve the one on ball bearings.

Big Subway Project in Chicago.

The Chicago Underground Subway company is an applicant for a franchise permitting it to construct subways under all the streets and alleys in the central district, bounded by Division street on the north, the lake and Michigan avenue on the east, Twenty second street on the south, and Ashland avenue on the west. George W. Jackson, formerly of the contracting firm of Wilson & Jackson, is the president, and John Phelan of Baltimore, Md., is one of the heavily interested men in the new company. The company claims to have a financial backing of $5,000,000, and the compensation it offers the city is the free right to use the subway for city water mains, fire-alarm, telegraph and police telephone and electric wires.

As introduced, the ordinance provides for the granting of a 50-year franchise to construct subways and place within them pneumatic tubes, telephone wires and cables, telegraph wires and cables, electric wires, gas and water mains and "such other things as the company may deem advisable to accept." The subway may be 18 feet [illegible]. The ordinance was sent to the committee on [illegible] and electric light, of which Alderman Mulcahy is chairman.

Western Electrician.

Judging by the list of papers and authors announced for the meeting of the Northwestern Electrical association at Milwaukee next week, and given on another page, the convention will be well worth attending. And it is becoming evident that the gathering will be a large one, with good prospects for sustained interest. The winter conventions of this organization are its annual meetings, when the officers are elected and when the element of recreation, although not forgotten, is naturally less conspicuous than at the summer pilgrimages. This year, when everybody is feeling the influence of improved business conditions, the members have a right to look forward to the most successful meeting in their history.

M. Anderson, the Icelandic scientist, who has labored so long and earnestly to accomplish the installation of an electric cable from Europe to the frozen island of the north, seems in a fair way to accomplish his purpose. The project is not new, but has been allowed to slumber so long that it has really been forgotten until quite recently. A company has been formed and the Icelandic Parliament has been asked for assistance. Twenty years ago 35,000 crowns was voted for this purpose. The Danish government has also promised to assist, so that the outlook is favorable for the establishment of telegraphic communication during 1898.

The route adopted is from the north of Scotland to Thorshaven, the chief town of the Faroe Islands, 250 miles distant, the greatest depth of the sea being 408 meters, with a bed composed of mud and broken shells. From Thorshaven to Bernfiord is 240 miles more, and the mean depth of the water is 550 meters, save at one point, where it attains 1,250 meters. The bottom is of sand, broken shells mud and in two places of broken pumice stone. From this landing point the line will be carried to Reikaivik, the capital, either by land or along the south coast. This latter portion will measure 200 to 300 miles, depending on the route.

Some of the figures presented in Mr. A. S. Hibbard's recent article in the Western Electrician on "The Telephone in 1897" are really remarkable. He shows that in Chicago, where the number of daily calls is greater than in any other exchange in the world and where an average of 3½ miles of wire is used for each connection, the total extent of wire connected up daily for telephonic conversation is 770,000 miles. The figure gives an idea of the extent to which the telephone enters into modern life. The central exchanges of New York and Chicago serve, in round numbers, 20,000 and 15,000 telephones, respectively, and there are thousands of instruments in the two cities that are not included in this enumeration. Mr. Hibbard says that probably 100,000,000 telephonic conversations are held yearly in the United States. And it is probable that the number will increase for several years to come, as the tendency now is to make the use of the telephone cheaper and more popular. Many of the trunk-line railroad men are now complaining that the use of the long-distance telephone is affecting their passenger receipts, and it is not impossible that the coming telephone extension in cities may have some similar effect on street-railway traffic.

It is a fact of much significance that at the St. Paul live-stock convention this week Mr. F. J. Berry, the well-known horse dealer of Chicago, took occasion to publicly deny, as the newspapers put it, "that there was any danger of electricity taking the place of the horse. Export demand for horses had doubled in 1895," he said, "and again in 1896. In 1897 this country exported 50,000 horses, the greater number of them sold on the Chicago market."

By this denial we presume that Mr. Berry means that horse breeders and dealers need have no fear from electrically propelled vehicles, which are now coming into prominence. Perhaps he is right, and undoubtedly the horse—the saddle horse in particular—will always be a familiar domestic animal, never without loyal admirers. Possibly, too, practice will show that the field for horseless carriages and wagons is a more limited one than is anticipated. And, again, it may prove in this as in older phases of industrial development, that while the horse is displaced in one avenue of human endeavor he will come into increased prominence in another. But the important fact remains, and that is that this late mechanical application to vehicular traffic has assumed such importance in the eyes of a practical man whose interests are involved that he has taken occasion to declare in public assembly that the horse is in no danger of disappearing from among us. It is certainly a declaration of considerable significance.

In the report of the case of Charles Thorpe, who sued the corporation of Dublin (Ireland) for injuries sustained by receiving an electric shock in the street, recovering $100, we find some interesting and amusing testimony. On the evening of October 30th, it seems, the plaintiff was standing close to one of the electric lamps at the corner of Nassau street and Grafton street, when he suddenly received a shock which threw him prostrate upon the ground, inflicting injuries which, it is claimed, rendered it necessary that he should temporarily abandon his employment and place himself under medical care. He testified that when he stepped on an iron plate in the ground he received a "terrific shock." He said he felt as if he was struck by hundreds of needles, and when he opened his mouth (for what purpose is not stated) he could not shut it, and he "was made to dance about." The judge remarked that the public ought to take notice of this dancing-board. The witness, continuing, said that he had never been the same since the accident and that he had been out of work since that time. His work, it transpired, was that of a clerk to a betting-man, for which he received $30 a week. The doctors appeared to have disagreed, as usual, over the case, for one at the hospital told Thorpe that he "ought to get cash out of this," while another, sent by the corporation, "jeered at the case and seemed to take the view of the electrical engineer more than anything else." The accident occurred on Saturday night, but on Monday the injured man was looking for a lawyer and the prospective cash. There was some question, at the trial, of the sobriety of some of the witnesses on the evening of the occurrence, and one man, William Darling, declared that it was an impudent falsehood for anyone to suggest that he appeared to have taken a drink. He was a perfectly sober man, he said, and on that day he had only taken three glasses of porter after three o'clock. The most damaging bit of evidence against the defense was the admission of the superintendent of the electric light system that on the night in question the insulation did give way on some of the underground cables and the current was then shut off.

The lawyer for the city thought that even if the plaintiff had received injuries they were of the most trifling character, but the recorder thought that it was a serious case. The report of a portion of his honor's finding is worth quoting from the report: The electric system in Dublin, although good, was not by any means perfect, as they all knew. He, therefore, held that sufficient control was not exercised, and he was confirmed in that by the fact that the corporation was applying for the means of an improved supply or system. It was astonishing how in courts they heard people swearing other people out of their senses. There was not a shadow of a doubt on the evidence that this thing took place. The action and conduct of the plaintiff throughout proved that he was not intriguing or malingering or attempting deception. This young man at the corner of Nassau street, and two others, strangers apparently to each other, met, and the plaintiff stood upon this iron plate and was turned almost into a Christmas harlequin—that he felt something like the pricking of needles. It was a mercy that he was not killed. It was dramatically one of the most remarkable incidents that had occurred in the city. He was told that what had been deposed to was impossible to have occurred. He did not care a fig for what scientists might say in view of proved and certain facts. He did not, however, believe that the plaintiff was much injured. He believed that he received a shock, followed by nervous excitement. In conclusion, he considered that the plaintiff would be fairly treated if he made a decree for £20 and £3 3s. for the attendance of Dr. Fegan. At this point the doctor spoke up and said that he had attended his patient eight times, so the judge made the decree £25 altogether.

Reports of Chicago Electric Railway Companies.

The annual meetings of several of the street-railway companies of Chicago were held during the week. At that of the

West Chicago Street Railroad Company

Mr. Yerkes stated his belief that there was no end to the life of the franchises of the company. "We realize," said he, "it is now proper for the West Chicago road to pay the city a fair share of its profits. But the excessive amounts suggested by ignorant people are not worth talking about. No improvement of this road has been made without great opposition, and not one but has been a great blessing to the city. We have done for the city infinitely more than it has done for us."

President Yerkes' report to the stockholders was as follows:

"Since our last report there have been a number of changes made in the condition of our affairs, and we find the reverse as far as our business is concerned, to what it was the year previous. That is to say, in the year 1896 the fore part of the year was good, while the latter part was bad. In 1897 the fore part was bad, while the latter was good.

"For eight months during last year there was a decrease in receipts, and for four months there was an increase. I am pleased to say, however, that the decrease was more than met by the decrease in expenses.

"The decrease for the first eight months amounted to $194,122.18, and the increase during the last four months amounted to $68,838.87, making a total decrease in receipts of $125,283.13 and a decrease in expenses of $208,704.07.

"The total amount of receipts for the year 1897 was $3,899,918.19. The operating expenses were $1,929,664.48, leaving a profit from operating of $1,970,253.71, against $1,880,569.90 for the previous year.

"The interest charges, insurance and taxes amounted to $399,719.79, against $280,906.68 for the previous year, which left a balance of $1,570,533.92, from which we deduct fixed charges amounting to $736,465.00, which leaves a balance applicable to dividends of $834,068.92, against 864,455.72, being at the rate of 6.32 per cent. interest on the capital stock.

"Notwithstanding the decrease in expenses, I can safely say that the road was never in such good condition as it is at the present time. The tracks have been kept in excellent order and the rolling stock greatly improved, and this result certainly reflects much credit upon the general manager, Mr. Roach, and his superintendent, Mr. Yuille.

"During the year $10,000,000 consolidated five per cent. bonds were issued. $4,000,000 of these bonds were deposited with a trust company to take the place of the $4,000,000 first mortgage bonds when those bonds become due. The balance were used to retire the debenture bonds and to pay off the floating debt, which had been incurred by changing from horse to electric power. The latter weighed most heavily upon this company during the critical financial days of 1896, and the fact that it is removed is a subject of congratulation to the stockholders.

"As you will notice by the statement given you in the fore part of this report, the street railroad companies did not really feel the effect of the improvement in business until the month of September. Every month from the 1st of January showed a decided loss, when suddenly in that month a change took place, which has continued ever since.

"It was expected that the opening of the loop would have an effect upon the business of this company, but strange to say, notwithstanding the fact that the loop commenced business the fore part of October, the increase in receipts for October over the same month last year was over $22,000.

"There is no doubt in my mind that it does have some effect on our company, but the truth is, that better facilities induce travel, and while it is possible that our increase since the loop commenced running would have been greater, yet, it is certain that the opening of the loop has produced an increase in travel.

"As I said to you last year, the prospect for the future depended entirely on the general business of the country, which at that time did not look very bright, so that prospects for this year depend on the same cause, but the reverse this year is the case, because there never was a brighter outlook for the business interests of this country than at the present time."

The report of the treasurer showed the following comparison of financial condition with that of 1896: Gross earnings, $3,899,918, decrease, $119,030; operating expenses, $1,929,664, decrease, $208,714; profits from operation, $1,970,253, increase, $89,683; fixed charges, including taxes, interest, rental of leased land, $1,136,184, increase, $120,070; applicable to dividends, $834,068, decrease, $30,386; dividends paid, $791,340, same as 1896; income account, $42,728, decrease $30,386; percentage earned on capital stock, 6.32; 1896, 6.55.

The following named directors were re-elected: Charles T. Yerkes, William L. Elkins, P. A. B. Widener, Harvey T. Weeks, S. W. Rawson, F. H. Winston and J. M. Roach.

North Chicago Street Railroad Company

Mr. Yerkes told the stockholders of this company that there was no street railroad in the world "in a finer condition as regards tracks, depots, power houses, rolling stock and everything pertaining to the operating department;" and the president is convinced that the North Side system, "has attained the perfection that we have been working to accomplish." The cost of the experimental Connolly gas motors has been charged to profit and loss. The treasurer's report was as follows:

Capital 1896, $6,600,000; 1897, $6,600,000.

Receipts.

	1896.	1897.
Passengers	$2,826,800.65	$2,818,398.90
Other sources	86,909 81	93,153.51
	$2,913,710.46	$2,911,552 41
Operating expenses	1,394,387.93	1,319,926.63
Net earnings	$1,519,322.53	$1,591,625.78
Charges: Including railway rental, taxes, interest, insurance and loss on World's Fair stock and Connolly motors	524,231.40	636,462.73
Net on stock	$ 995,091.13	$ 955,163.05
Regular dividends paid	758,901.00	791,943.00
Balance	$ 236,190.13	$ 163,220 05
Percentage earned on stock	15.07	14.47
Percentage operating expenses	49 32	46.83
Passengers carried	56,523,620	56,354,147
Miles run	10,590,036	10,644,270
Passengers per mile	5.3	....
Receipts per mile	26.5	....

Receipts.

	1896.	1897.
Cable lines	$1,535,311 05	$1,421,848.78
Electric lines	1,192,601.85	1,375,638.57
Horse lines	98,887 75	20,911 55
Total receipts	$2,826,800.65	$2,818,398.90
Percentage of operating expenses:		
Cable	45 17	47.67
Electric	51.22	44.92
Horse	90.98	115.26
Cost per car-mile:		
Cable	13.00	13 40
Electric	12.50	11.40
Horse	22.10	20.60

Directors were elected as follows: Charles T. Yerkes, W. F. Furbeck, F. H. Winston, J. Charles Moore and Benjamin B. Lamb, the last-named succeeding Hugh McBirney.

Lake Street Elevated Railroad Company.

The report of this company was disappointing, and the stock sold down from 16½ to 13 on the strength of it, although there was afterward some recovery. President Louderback, in his report, said:

"Considering the fact that for the first six months of the year we had business depression in all parts of the city and the country at large our results may be considered satisfactory.

Gross earnings (increase $6,292.05)		$579,960.73
Operating expenses (decrease $10,258.90)		339,124.21
Net earnings (increase $16,550)		$230,636.19
Fixed charges:		
Interest (miscellaneous)	$ 29,673 58	
Taxes	16,618.90	
Coupon interest, nonassenting bonds	32,810.00	
Coupon interest, debentures	194,795.00	
Loop rentals	15 707.20	
Total		$291,789.66
Deficit for year		40,962.19
Extraordinary expenses for improvements, which might properly be charged to construction account, but are charged to expenses, amount to		31 680.17
Making the total deficit		$ 72,642 36

"In the deficit of $40,962.19 there is included the 40 per cent. paid by order of court on 175 nonassenting bonds, amounting to $8,750, which, if deducted, would leave the actual deficit $32,212 19.

"It is the policy of the company to charge into expense account everything which can properly be placed there.

"During the year the company received valuable franchises in the town of Cicero by the terms of which it is privileged to build an extension of one mile of elevated structure in Lake street and surface feeder lines in the remainder of the territory covered by the ordinance.

"We have also during the last year made connections with the Suburban Electric Railroad company at Fifty-second street and Robinson avenue, which will in time become a very valuable feeder, tapping as it does a number of the growing towns west and southwest of our terminus.

"We have now under consideration additional franchises in the territory west of Fifty-second street, which will benefit that entire section and build it up very rapidly, and at the same time add largely to the revenue of this company.

"October 1st the loop was completed and opened for traffic, and, while these additional terminal facilities did not enable us to derive as great benefits as accrued to the other elevated roads, our receipts were materially increased.

"The business of the company is increasing and there is no doubt that this year we will reap substantial benefits from the improvements recently made and the connection arranged for."

The road carries about 30,000 passengers daily.

Columbia Construction Company

This is the company organized to build the Northwestern elevated railroad. The annual report showed that during the year the only construction work done has been in the erection of the iron which was then on the ground, being 4,409 feet of four-track structure from Dayton street to Fullerton avenue, and 2,400 feet from Grace street to a point just north of Buena Park station, making a total distance of 1.3 miles during 1897, and up to date 3.2 miles of four-track structure. The manufactured metal will cover 80 per cent. of the entire length of the road. Fifty-one per cent. of the entire length of the structure has been erected, and 10 per cent. of the maufactured metal which has not been erected is now distributed along the right-of-way between Belden and Fullerton avenues.

Mr. Louderback, the president of the company, concludes his report as follows: "Everything pertaining to the construction of the Northwestern elevated railroad is in first-class condition to push the road to a speedy completion as soon as satisfactory financial arrangements can be made. Several attempts have been made to finance the road during the last year, but owing to financial stringency in the beginning of the year, and various complications since, it has been impossible to do so up to the present time. We have expended on account of real estate, construction, interest and due bills issued to subscribers the sum of $6,290,611.53. We estimate it will require to complete the road the further sum of $2,712,737, and to pay off its obligations (after realizing on its assets) and to complete the road, the total sum of $3,500,000. That something must be done there is no doubt, as the structure already erected is gradually going to decay. This company has been overcome by the unfortunate conditions which have prevailed in finances almost ever since the construction was commenced, and it seems as though, if an arrangement could be made by which the Northwestern company could finish the road, it would be well to do so, and thereby relieve the construction company."

By a resolution offered by B. E. Sunny, the Columbia stockholders voted to surrender their contract, leaving to the Northwestern company the work of completing the structure. Failure to secure funds is given as the cause for this action. Mr. Yerkes stated that the Northwestern company would be able to negotiate a sale of $4,000,000 of its bonds if it could act directly, and intimated that a price of 90 could be obtained from an eastern syndicate, the proceeds at that price being $3,600,000, which covers the $3,500,000 necessary to complete the road.

Calumet Electric Street Railway Company.

The Calumet electric railway of Chicago has the unusual distinction of being operated by the receiver of a national bank. It was practically owned by the National Bank of Illinois at the time of the failure of that institution, and is now operated for the benefit of the creditors of the bank. John C. McKeon, the former receiver of both institutions, has just made his report. He says that the average monthly earnings show an increase of 20 per cent. over the earnings of the road for the corresponding months of the previous year. He regards the property as a valuable asset of the National Bank of Illinois, and thinks the traffic figures indicate that the road can be sold in a year or two for sufficient to cover the $2,575,000 advanced to it by the bank.

The report shows that for the seven months of last year that the receiver had charge of the road its earnings were $144,995.17, and the operating expenses, including maintenance, were $121,025.30, giving a gain of $23,969.87 over expenses. During the year $72,037.98 was expended for construction, $20,134 77 of old claims were paid by order of court, and a loan of $38,500 from the National Bank of Illinois was repaid.

The balance sheet accompanying the report is as follows:

Cash on hand April 30, 1897	$ 511 65
Passenger receipts	141,136 09
Miscellaneous receipts	3,859 08
Sale of receiver's certificates	144,703 20
Accrued interest of same	1,363 13
Total receipts	$291,603.15

The expenses were:

Operation	$121,025 30
Construction	72,037 98
Interest on receiver's certificates	525 83
American Casualty Insurance company	1,101 46
Settlement of prior litigation (accidents)	2,916 61
Approved claims per order of court	20,134 [illegible]
Cash advances	38,500 00
Bills payable	22,509 41
Interest	1,891 18
Due from city of Chicago	11 35
Total expenditures	$281,[illegible]
Less decrease in stores and vouchers approved and unpaid	[illegible] 42
	$[illegible]
Cash on hand and in Pullman Loan and Savings Bank	$[illegible]

The road has 68 miles of track south of Sixty-third street, with lines running to South Chicago, Roby, Kensington, Pullman, West Pullman and intermediate territory.

Chicago General Railway Company

At the annual meeting of the stockholders of the Chicago General Railway company Glenn E. Plumb was elected director in place of L. F. McGann, resigned. The full board is now as follows: J. P. Black, John H. Witbeck, C. L. Bonney, Lyman M. Paine, Glenn E. Plumb, L. C. Bonney and S. D. Lawton. The officers are President John H. Wit-

beck; vice-president, C. L. Bonney; secretary and treasurer, L. C. Bonney.

The operating statement of the West and South Towns Street Railway company from January 1 to July 31, 1897, shows a deficit of $17,226. On August 1st the property was taken over by the Chicago General company, and from that date to December 31st, operating 13½ miles of single track, the latter company showed a gain in receipts over disbursements amounting to $18,376. The net result for the whole year was as follows:

Receipts.

From passengers	$78,699.40	
Miscellaneous	1,121.83	
		$79,821.23
Disbursements.		
Maintenance	$ 5,474.71	
Transportation	29,411.23	
General expenses and taxes	7,632.82	
		$42,518.76
Fixed charges		36,155.00
Total		$78,671.76
Gain		1,149.47

Gas Has Its Place.

[From the New York Sun.]

Everyone must recognize the beauty and many advantages possessed by the electric light, but perhaps few have thought of the discomforts to which a large part of the population would be put if this most modern and perfect illuminant were to supersede all the older forms in use.

An excellent example of this is to be found in the large workroom of the reporters in The Sun office. In the room are scores of incandescent electric lamps, and no gas jacks for light, but at an odd corner there is also a burning one little gas jet, whose light is insignificant, but dearer to the men who work about it than all the electric lights in the room. Day and night, year in and year out, this gas jet burns with a flame not more than half an inch high, and a quarter of an inch broad, and day and night it is the Mecca of every man who resorts to tobacco smoking to soothe his nerves or kill idle moments. Everybody knows where to find a light for cigar, pipe or cigarette, but the way not true years ago when the electric lights took the place of the old gas jets which lit the room. With these open lights in profusion no one had ever found it necessary to keep a stock of matches at hand for starting a smoke. For many a day and night after the electric lights were established there were great hunts through the office for matches, and often finally it became the fixed custom to have a light going at a corner near the parting desk to accommodate the smokers.

Receipts of the Citizens' Traction company of Oshkosh, Wis., for 173 days' operation amount to $17,777. The company's one-half per cent. tax amounts to $265.55.

Montauk Multiphase Fire and Burglar Cable.

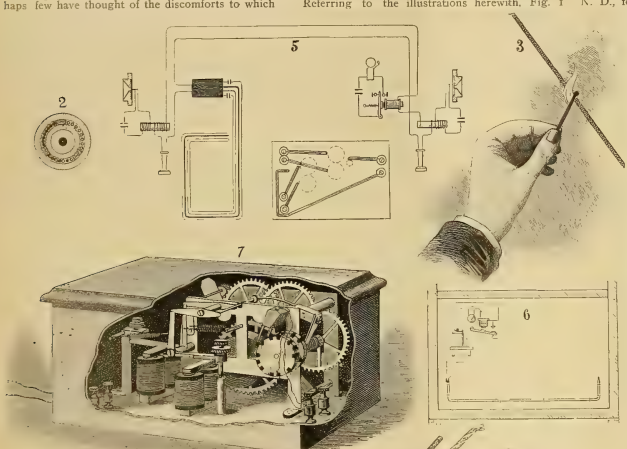
The Mntauk Multiphase Cable company of 100 Broadway, New York city, has recently placed on the market an electric cable, which promises to be of great value in many directions. The officers of the company are: President, John D. Gould; vice-president, C. W. Price; secretary and treasurer, Charles A. Hanson. These gentlemen, with Horace D. Brockway, form the executive committee of the company. Mr. Price, the vice-president, is a well-known electrician, and was formerly superintendent of the Baltimore and Ohio Telegraph company, and was later connected with the Westinghouse interests.

The manufacturers of the Montauk multiphase cable state that it is not a competitor of any electrical interest, but it is designed as an auxiliary to all systems of fire and burglar protection now in use. The principal difference is that every part of the cable is alive to the approach of dangerous heat or flame and is capable of giving an automatic warning at any desired point. The breaking of the cable will perform the same service. The use of this cable to connect thermostats and other heat-detecting devices as well as burglar-alarms is said to insure a perfection of protection heretofore unknown.

Referring to the illustrations herewith, Fig. 1 shows the cable, which is stranded on an inner copper wire coated with a metal that fuses at the low temperature of 374 degrees. It is stated that the fusible metal alone would carry the necessary current, but the copper is increased to increase the conductivity. A suitable insulation is braided on the fusible metal coating, and over this is stranded a series of smaller wires, separated with insulations, as shown in the illustration. The cable is now covered with an outer protective wrapping. One of the outer wires may form a fire-alarm circuit, another a burglar-alarm circuit, another may be added for a servant's call, and still others may be used for a number of electrical purposes. Fig. 2 shows a cross-section of the cable. In Fig. 3 is illustrated the fact that the cable may be fused with a lighted match. Fig. 4 shows the cable surrounded by a conduit for use on ships. A wiring diagram for a house fire alarm system connected with the central fire station is shown in Fig. 5. Fig. 6 illustrates the method of wiring a room for fire alarm. When the circuit is automatically closed by an outbreak of fire the current operates the magnets in the controller, shown in Fig. 7, which act upon a system of levers and release a clock mechanism. The arms to rotate two controlling disks, which by means of make-and-break contacts ring up the call corresponding to the location of the fire and show the corresponding number on the annunciator. The disks are so arranged that they repeat the alarm at the central fire station.

The Montauk multiphase cable forms an effective burglar alarm, for if a burglar should attempt to cut the cable the pliers will form a metallic connection between the inner and outer wires of the cable and close the circuit, thus giving an alarm. To avoid any error in connecting up the return wires, they are made in different colors. The fire-alarm wires are of copper, another set are copper wires tinned, and a third set may consist of alternate tinned and copper wires. To reduce the bulk, each set consists of several fine wires whose aggregate cross-section is sufficient to make up the required conductivity. In view of the many purposes for which this cable is designed, its bulk is extremely small, in fact small enough to be installed without attracting unusual attention.

Where this cable is used on shipboard, such as for detecting fire in coal bunkers, it is laid in a conduit which protects it from rough usage, and at the same time leaves it exposed to the action of the heat. The Montauk Multiphase Cable company owns a number of patents covering this cable, and states that it is a manufacturer only, and does not contract or install systems.



MONTAUK MULTIPHASE FIRE AND BURGLAR CABLE.

Telephone News from the Northwest.

[From the Minneapolis correspondent of the Western Electrician.]

The City Council has been petitioned in Fargo, N. D., for relief from poor telephone service furnished by the Northwestern Telephone Exchange company. Dr. Hill was appointed a committee of one to lay the complaint before the officials of the company in Minneapolis.

G. Taylor Wright has a project for a telephone exchange at Humeston, Ia.

The Wisconsin Telephone company will shortly give Waupaca, Wis., all-night service. The telephone system will be used for fire alarms altogether hereafter.

The Wisconsin Valley Telephone company has arranged to connect its long-distance system with the Luce-Vietch exchange at Galesville, Wis.

The Wisconsin Telephone company has won the first round of the fight between the city of Sheboygan, Wis., and itself. The friends of the company have succeeded in having the council refer the proposal of General Bragg to take the case against the company, to a committee. A report is not looked for from the committee very soon, and the time is drawing near when the company will have obtained a right to occupy the streets by adverse possession.

The Marquette County Telephone company has declared a dividend of $10 per share. The company has been organized but three years, and has been operating its system but two. In view of the opposition from the Bell company this showing is gratifying.

The result of advancing telephone rates in Oshkosh, Wis., by the Wisconsin Telephone company has resulted in 40 instruments being ordered out. The company has had its rates below that of the Northwestern Telephone company for a year, and on January 1st it advanced them to the same as the home company's. The Wisconsin company has about 500 subscribers and the home company 531.

The Eau Claire Telephone company's exchange is being installed in Eau Claire, Wis., as rapidly as possible. Toll-line connection over the Wisconsin Valley Telephone company lines will give connection with 120 towns. A large number of them are already connected and the remainder will be soon.

The Electric City Telephone company has opened its exchange for business at Great Falls, Mont. The company is a home institution and cooperative to a certain extent.

Several Minneapolis aldermen have gone to Willmar, Minn., to examine the Western Electric Telephone company's instruments in use there. They go on the invitation of that company, which is seeking an entrance to Minneapolis. A number of business men from outside towns have petitioned the Minneapolis Council to give them connection with this city over the Western Electric company's wires.

A practical test of the long-distance telephone was made last week. Charles J. Glidden, president of the Traders' National Bank of Lowell, Mass., was in Minneapolis, and by means of the American Telephone and Telegraph company's wires, presided over the regular meeting of the bank directors, held in Lowell. Mr. Glidden called the meeting to order and easily recognized each member as he spoke into the instrument 1,500 miles away.

The Northwestern Telephone Exchange company has paid the state treasurer of Minnesota $10,024, being the three per cent. on its gross earnings for 1897 business.

Because the Chicago Daily News, on December 31st, printed an article bitterly arraigning the projectors of the Northwestern elevated railroad in Chicago, under the title "Northwestern Elevated Bandits," the company has brought suit to recover $300,000 for damages for the libel alleged

Farr Telephone and Construction Supply Company in Its New Home.

In the accompanying illustration (Fig. 1) is shown an interior view of the office and salesroom of the Farr Telephone and Construction Supply company, now located in new and commodious quarters in the Ellsworth building, 357 Dearborn street, Chicago. The success of this company has been so marked that a brief sketch of its career will be of interest.

The Farr Telephone and Construction Supply company was founded February 1, 1895, locating at 342 Dearborn street, Chicago, and was incor-

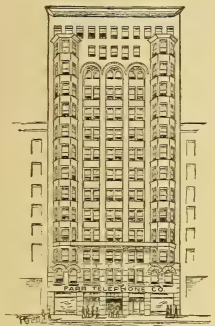


FIG. 2. FARR TELEPHONE AND CONSTRUCTION SUPPLY COMPANY IN ITS NEW HOME

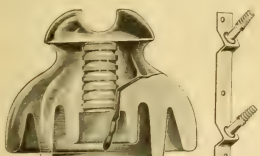
porated under the laws of the state of Illinois March 30, 1896 with a capital stock of $10,000. By honesty and fair dealing its trade has increased with rapid strides. Its business during the last year amounted to over $50,000. The success of the company is attributed to the principles it adopted when starting into business, namely, to make every customer satisfied even if a sacrifice must be made to do so. This method has secured for it a large number of steady customers extending from California to Prince Edward's Island and many foreign countries.

The head of the firm, C. W. Farr, is a thorough telephone man, having been associated with the Bell Telephone company for 12 years. On January 1st the company took up new quarters in the 14-story Ellsworth building, an exterior view of which is shown in Fig. 2, facing Dearborn street and Plymouth place. The offices and show store are on the ground floor of 357 Dearborn street, and the electric assembling room and shipping department are at 88 and 90 Plymouth place. The officers of the company are: President, C. W. Farr; N. O. Farr, vice-president; secretary and treasurer, R. J. Cram (of Detroit, Mich.); general manager, E. W. Hurst.

Locke Insulating Devices.

The cuts show two of the insulating specialties that have made the name of Fred M. Locke of Victor, N. Y., famous. Fig. 1 represents Mr. Locke's patent triple-petticoat glass insulator for



FIGS. 1 AND 2. LOCKE INSULATING DEVICES

potentials up to 20,000 volts. This insulator is 5½ inches in diameter and 4½ inches high. It will carry with satisfaction any current up to 20,000 volts. The manufacturer supplied in December over 30,000 of these insulators, carrying potential up to 17,500 volts.

The two-pin upright galvanized side bracket is shown in Fig. 2. This device is used for attaching high-capacity insulators to the sides of buildings and other similar places. These brackets are made in several convenient sizes.

Technical Projects Before Congress.

A bill is before the House of Representatives to establish engineering experimental stations in connection with the colleges established throughout the United States, where investigations and research may be carried on relative to the principles and applications of the various branches of the science of engineering and of naval architecture; to aid the Navy Department in its researches, to enlist the co-operation of builders, manufacturers, and establishments in the prosecution of such experimental work as will secure to the naval service the best material, the highest type of motive power and other machinery and accessories for warships and other naval vessels; to aid states and territories in the experimental determination of the composition and value of their minerals, fuels, constructive materials, and other resources, as well as the scientific and economic questions involved in the utilization of raw materials and the development of water, steam and electric power in the production of manufacturing products, and to this end it is asked that an appropriate amount be set aside from year to year by the government for the furtherance of such an idea.

Representative Bennet has introduced a bill to provide for a contract between the government and the Pacific Cable company of New York, whereby for the sum of $125,000 per year, payable quarterly, for 20 years, official communication may be maintained between the United States and Honolulu in the Hawaiian Islands, either by means of electrical or other methods, through a submarine cable of cables and connecting land lines; also to Japan and Australia.

A bill is before the Senate looking to the extension of the track of the Capital Traction company of Washington from its present line at Eighth and Pennsylvania avenue S. E., to the Avenue bridge, this extension to be completed within one year.

Another bill, introduced by Representative Curtis of Iowa, provides for an amalgamation between the Eckington and Soldiers' Home Railway company, the Maryland and Washington company and the Belt Line, whereby a means of electrical transportation may be opened up between Washington and Laurel, Md. The bill also provides that the name of the Eckington company shall be changed to that of the "City and Suburban Railway company."

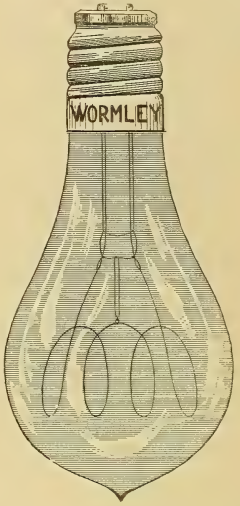
It is proposed to regulate the charges for telephone service in the District of Columbia by means of Congressional regulations, which would place a charge of $25 per annum for telephones in private houses, $35 for those in business or commercial houses, and $50 per annum for all telephones placed in hotels. The bill carries with it a provision for a fine of $250 for each and every contract that should be made for charges in excess of the amounts named above.

The Capital Traction company is seeking a further amendment to its charter by means of which it may extend its underground system from its present terminus on U street, so as to make a loop line near the northeastern section of the city.

Nicholas Bink has been granted an electric light franchise in Chilton, Wis.

The Wormley Lamp.

The accompanying cut illustrates one of five new styles of incandescent lamps just placed on the market by James C. Wormley & Co. of 1242 Marquette building, Chicago. These lamps, together



THE WORMLEY LAMP.

with about 60 other lamps, all of different styles, will be on exhibition at the Northwestern Electrical convention in Milwaukee, January 19th.

The new 220-volt Wormley lamp is claimed to be

FIG. 1. FARR TELEPHONE AND CONSTRUCTION SUPPLY COMPANY IN ITS NEW HOME

of an efficiency of three watts per candle power. James C. Wormley & Co. state that at a test just completed, lamps of this efficiency showed an average life of nearly 1,000 hours, which is a remarkable showing for 220-volt, three-watt lamps. The Farr is also making a specialty of 50-watt 110-volt power lamps in regular voltages, and has many good reports of their work from well-known consumers.

The Wormley lamps are manufactured exclusively by the Shelby Electric company of Shelby, O., under contract which permits Wormley & Co. to

inspector in the factory, who personally tests all lamps before accepting them from the factory. This protection permits Wormley & Co. to guarantee each individual lamp as perfect and to make additional guarantee that all shipments will be "perfectly satisfactory in every respect." The firm pays freight both ways on trial orders, if goods are not found as represented. It also sells the regular Shelby "tipless bulb" lamps. It has branch offices at 207 Newspaper Row, St. Paul, Minn., and 600 Burlington building, St. Louis, Mo.

CORRESPONDENCE.

New York Notes.

New York, January 11.—It has been reported that Tammany intends to introduce a bill at Albany to legislate the Rapid Transit Commission out of office, but the rumor is not generally credited. H. H. Vreeland, president of the Metropolitan Street Railway company, when asked what influence any organized opposition by Tammany to the underground road would have upon his company, said that if his engineers decided that the plans were practicable his company would bid for the contract despite any change in the political complexion of the commission. He doubted, however, if any such thing was contemplated.

Rapid progress has been made in the equipment of Metropolitan lines with the trolley conduit system. Cars have been operated with this system in Fourth and Madison avenues for about two months, coming as far down-town as Astor place, and by the end of the month it is expected that the electric cars will be running all the way to the postoffice. They will then come into fair competition with the cable cars in Broadway and Third avenue. In the meantime, the work of installing this same system on several other lines of the Metropolitan company is in progress. In addition to the Madison and Fourth avenue line, the longitudinal lines to be equipped with the underground trolley are those in Second, Sixth and Eighth avenues, and work has also been under way for some time in Twenty-third and Fifty-ninth streets. When all these roads are "electrified," about 60 of the 228 miles of railroad under the control of the Metropolitan company will be equipped with mechanical power—that is, either electricity or cable. In building the Fourth avenue line some unexpectedly serious obstacles were encountered in pipes of all kinds that had either to be moved to one side or sunk deeper in the earth to make room for the heavy yokes, which go down in the ground more than two feet and a half. At Fourth avenue and Twenty-third street, for instance, according to the Tribune's account, the underground conductors that had to be dealt with included one two-inch Edison pipe, two 2½-inch Edison pipes, one three-inch Manhattan light pipe, 10 three-inch electric subway pipes, two four-inch Western Union pipes, one four-inch gaspipe, seven six-inch gaspipes, two eight-inch gaspipes, one 10 inch gaspipe, one 12 inch gaspipe and one large trunk line sewer pipe. In spite of these things, rapid progress was made on the section between Astor place and Forty-second street. Traffic was stopped here on August 31st. Within an hour hundreds of men and teams were busy along the line, and in 24 working days this part of the road was completed so that horse cars were running over it again on September 30th. This section, of course, included the tunnel, about half a mile long, where everything had to be carried in and out at the ends. On the lower part of the line, where it runs through the Bowery, Grand, Broome and Center streets and along Park Row, special difficulties have been met with on account of the other railroads that have to be crossed, a number of curves and the putting in of a cross-over at the terminal by the postoffice. Nevertheless, it is expected that all the work will be finished and the electric cars in operation by or before the beginning of February. It is said that the cars on the East Side electric line travel at a faster rate of speed than is permitted on any other surface road in the city. In the tunnel between Thirty-third and Forty-second streets the motormen do not have to look out for vehicles and pedestrians, and stops for passengers are [illegible] consequently they turn the current on full [illegible] and run along at the rate of 15 or 20 miles an hour.

There is a good deal of [illegible] conjecture on the effect of electrolysis from the return current of the electric railway system on the Brooklyn Bridge, but only a few [illegible] that the [illegible] will be [illegible] in a few weeks. It is expected that within two or three weeks the [illegible] trolley cars [illegible] end of the bridge.

The new subway for telephone and telegraph wires under the Harlem River has just been finished. It is of Georgia pine, bound with iron hoops, and is two feet in diameter. It is laid [illegible] eight feet below the surface at [illegible] new Third avenue bridge. The wires [illegible] be drawn through the subway [illegible] the bottom of the river where they [illegible] exposed to disturbance.

Samuel Booth, an electrician [illegible] Abraham & Straus, died suddenly [illegible] while working on the electrical apparatus [illegible] employer's store. It was at first supposed that he died from an electric shock, but it was afterward said that he died from natural causes. Booth was 40 years old, and had worked for Abraham & Straus for three years. He was busy rearranging the brushes in the big dynamos under the center of the store, when he was seen to throw up his hands suddenly and fall over. A surgeon was sent for, but Booth died before assistance could be had.

Interest in the electrical show to be held in Madison Square Garden in May is in increasing. Everybody remembers the success of the show of 1896. Then it was held in a building comparatively unknown for such a purpose, yet it attracted not only the trade but great throngs of people from the territory within 100 miles of New York. The exhibitors themselves were well paid in business for the cost of their respective exhibits, and the best evidence of this fact is in the early demand from former exhibitors for increased allotments of space. Contracts are already in for more than one-half of the total space sold in 1896. When it is remembered that the exhibition is four months away and that at the last show, as usual in such shows, more space was sold just before the opening of the show than in the several months before, it will be readily seen that the latecomers may be losers. When the management took a lease of Madison Square Garden, it was thought to be a rather bold step. As the plans are now developing, it is evident that so big a building is absolutely necessary. The advantages of location and building and the increase both in variety and number of exhibits will certainly attract a large attendance. There were over 300,000 admissions in 1896. There was only one battery of boilers in operation in the 1896 exhibition. From the arrangements already made, there will be at least three in the Madison Square Garden show. The engine and dynamo exhibits will exceed those of the last show, it is said, by about three to one. All these things suggest to the intending exhibitor the importance of speed in securing space. While the garden is larger than the last exhibition building, the demand for space is greater in proportion than the increase of space. It is believed that the illustration of the various apparatus and supplies will be complete, varied and interesting, and public interest in these things will no doubt lead the newspapers to give the show a great deal of notice. It seems proper to say a word about the generating exhibit. In the old building, with a smaller and less interesting plant and only one entrance by an obscure stairway from the main hall, it proved to be a feature of public as well as trade interest. Enough interested people found their way into it to make it profitable to the exhibitors. In Madison Square Garden this feature will be larger, more varied, more interesting and more accessible. There will be at least four entrances from the three sides of the building, and the skill and care in placing the exhibits, pointing out the features and properly advertising them, which made the last operative exhibit successful, ought to make this one still more successful.

When Mayor Van Wyck suggested improved facilities for handling the "L" service of this city and intimated that electric motors should take the place of steam locomotives Russell Sage in an interview practically told the new mayor to mind his own business. Now, it seems, however, that the "old man" made a mistake, for George Gould has announced his intention of complying with the mayor's views and Russell Sage has been relegated to the rear. It is estimated that the new electrical plant will be the largest in the country, and although it is too early to make any reliable figures it is believed that a central station of 75,000 horse power capacity will be erected.

W. F. O.

New England News.

Boston, January 11.—It is reported that President Clark of the New York, New Haven and Hartford railroad and his associates are considering the advisability of constructing a third-rail electric system between Boston and Providence, a distance of about 50 miles, to be operated over the rails of the present steam line. Those who are exploiting this scheme argue that President Clark has shown on his Hartford and New Britain branch that frequent service and low fares mean a tremendous increase in business, amounting, in the case of this short line, to over 300 per cent. per day, it is said. If the time ever comes when the company can see its way clear to unite the capital city of Rhode Island and Boston with a third rail line, there is no question as to the effect it would have in stimulating traffic, not only between the terminal points, but between intermediate stations, as thousands of people would, if the rates were put down to a street car basis, make frequent visits to relatives and friends in other towns, while thousands would ride simply for the pleasure of the thing. President Clark has shown by the advanced step he has taken in the field of electrical traction that he is a thorough believer in its applicability to steam roads, and it is to his enterprise and far sightedness that the New England communities are indebted for the benefits they now enjoy as a result of the wider use of electricity in heavy railroad work.

A plan for the consolidation of nearly all the electric light and power plants in Portland, Deering and Westbrook, Me., is under consideration. The Indurated Fiber company of Lockport, N. Y., which controls extensive water privileges on the Presumpscot River at North Gorham, Me., endeavored to secure from the Legislature a permit to furnish electricity for Portland, but the Consolidated Electric Light company, which holds an exclusive privilege in Portland, fought and succeeded in defeating the petition. Thereupon the other company granted an option on its water privilege to several capitalists, who organized the Sebago Electric Power company and bought up the rights of the old Portland Electric Light company, which had some years ago ceased to do business. These rights were supposed to include authority to do business in Portland, but that claim is denied, and it is said that it will be vigorously contested by the company now in possession of the Portland field. According to the best information, the Sebago Electric Power company has made a proposition to supply power to the several electric light companies that are supplying Portland, Deering and Westbrook, the Portland and Yarmouth electric street railway, the Warren Manufacturing company of Cumberland Mills and the Portland and Cape Elizabeth railway. The various corporations are considering the proposition, and are said to look favorably upon it. The new project contemplates the building of a series of dams on the Presumpscot River at North Gorham and the erection of a large power house at Rockameecook Falls.

A main steam pipe exploded at the Albany street power house of the West End recently, but by a fortunate combination of circumstances no one was killed or seriously injured. The pipe which burst was one which ran from the main power station into the old building in which the original electric plant of the West End company, operated by high-speed engines, is located. This old plant is used as an auxiliary one, and is operated perhaps not more than once a month, when power is needed. The break occurred in a joint of the main pipe, and with its force blew off a portion of the roof of the building and broke the windows in the place and in adjoining buildings. It had been the intention of the company to put in a new pipe or discontinue the use of the old plant.

It is said that negotiations are pending which will result in the purchase of the Newburyport, Amesbury and Plum Island electric railroad by the Lowell, Lawrence and Haverhill Railroad company. This will give the last named road complete control of all the electric railroads between Lowell and the ocean.

The Boston Electric Light company has purchased the entire property known as the Harrison Loring property, situated on the water front on East First street, South Boston. There are more than 16 acres of solid lands and flats in the premises, besides the buildings. The total water frontage is about 500 feet, extending out to the reserved channel. This valuable property is below all bridges and has advantages of deep water, making it a much-desired location for the company to build a plant as large as all its stations combined, with plenty of room for expansion. The valuation of the property is about $97,000.

The lease of the West End Street Railway company to the Boston Elevated Railway company has created some inquiry as to just what has taken place in the process of consolidation and of the nature of the relationship that these interests bear one to the other. So far as the work of amalgamation has gone, no real change has taken place in the financial department of the West End. The receipts, of course, are now turned over to the treasurer of the new company, and the disbursements also are directed from his office. Practical men will be required at the head of the several divisions, and these in turn must be under the immediate supervision of someone having a thorough knowledge of the operating department, and it may be that many of the old and tried officials of the company will be retained in their present positions. It is gossiped that the $7,500 annually set aside under the West End lease for maintenance of the West End organization will be expended as follows: For president, $3,000; treasurer, $2,500; vice-president and clerk, $1,500; directors, $500. Gen. William A. Bancroft assumes the direction of the practical operation of the street-car interests which have been leased to the Boston Elevated Railway company. This change, according to existing arrangements, marks the cessation of the West End as an operating company for 25 years and perhaps forever. The West End will maintain an organization somewhat different from its past organization, but that organization is not yet determined upon.

The railroad committee of the Boston Board of Aldermen has made a favorable report on the petition of E. Moody Boynton, for a location for his elevated bicycle railroad in the streets of Boston. Mr. Boynton has been before different legislative bodies in Massachusetts for years trying to get a charter under which he could operate his road. The Legislature of 1897 gave him a charter to build from Fall River to Boston, paralleling the lines of the New York, New Haven and Hartford to Boston, but the location stopped at the boundary of the city. Now Mr. Boynton wants a charter so that he can take his passengers right "downtown."

Work upon the construction of the new storage building to be erected in this city, Fabin and Canton streets, by the Edison Electric Illuminating company, has again begun and the foundations are nearly completed. The structure will be built of brick and stone, and will have a frontage each on

Canton and Fabin streets of 30 feet, extending from one street to the other. It will be two stories high and 90 feet long, built in the most substantial manner and fireproof throughout.

Mr. John W. Gibboney, private secretary to Professor Elihu Thomson of the General Electric company, a position which he had held for several years, died in Lynn on December 27th. He was a talented inventor, not only in electrical matters, but in other fields of mechanical development. He made a series of elaborate inventions in relation to the use of the electrical current in telephone work. Mr. Gibboney had also made valuable inventions in the way of windmill improvements and the storage of electricity by means of wind power. Another line of his inventions was in the attainment of greater efficiency of water heating by means of gas. He was born in Pennsylvania 40 years ago and leaves a widow and two children. C. S. G.

Northwestern Notations.

Minneapolis, January 11.—Mr. Thompson, who is putting in an electric light plant at Dawson, Minn., finds the demand for lights so much greater than he expected that he will put in a larger plant than was at first intended.

The Lanesboro, Minn., electric light plant was attached recently for between $600 and $700, claimed to be due Ed. Lynch for wages.

The Western Union Telegraph company is arranging to extend its wires north from Seattle, Wash., to Victoria. The line will be in operation in a few weeks.

Fred Donaldson's grain elevator in Yankton, S. D., is operated by electricity generated by an artesian well.

The Citizens' Electric company of Lewistown, Mont., has been organized and $4,200 worth of stock subscribed. The present company's service is very unsatisfactory and this step is being taken to get better light.

The Gisholt Machine company of Madison, Wis., which operates a plant to furnish light for its own factory, has applied for a franchise to furnish commercial lighting.

The council of Council Bluffs, Ia., has granted a franchise for an electric car line to the Council Bluffs, Lake Manawa and East Omaha Construction company.

The street railway system of St. Cloud, Minn., will be sold January 27th. The amount due on bonds and interest is $187,272. The company has just received six new motors, the old ones being worn out.

J. K. Tillotson of the Citizens' Traction company of Oshkosh, Wis., says he has practically concluded arrangements for an electric line to Neenah, and that it has no connection with the Appleton-Neenah line now being constructed.

The electric light plant at Bedford, Ia., is about completed.

Louis Christiansen secured a verdict against the Winona Street Railway and Light company, in Winona, Minn., for $2,000 damages for the loss of his minor son's leg.

F. H. Josslyn sues George H. Ketcham in Oshkosh, Wis., to recover $2,256.98 for services rendered in promoting an electric street railway in the city of Oshkosh.

Charles H. Baker of Seattle, Wash., has bought Snoqualmie Falls, near that city, and will develop electric power and transmit it to Tacoma, 30 miles, and Seattle, 29 miles. The minimum power expected in the dry season is 32,000 horse power and the average for 10 months of the year is expected to be about 50,000.

Electric lighting is being talked of in Mandan, N. D.

J. G. Harschberger has been granted a 10-year franchise for electric lighting in Lancaster, Wis.

The Centerville, Iowa, Electric company has been incorporated to put in an electric light plant and has applied to the council for a franchise.

Gouldberg & Anderson of Cambridge, Minn., have been granted a franchise for an electric light plant. The Northwestern Electric company of St. Paul is putting in the plant.

The council of Grand Forks, N. D., has added $15,000 to the annual appropriation to purchase an electric light plant. Injunction proceedings will be begun, it is said, as soon as an attempt is made to enter into a contract.

Stephen Bull has established an electric plant in Racine, Wis., at a cost of $7,000, to furnish light for several residences.

The Superior Rapid Transit company of West Superior, Wis., will hereafter carry mail to the outlying districts.

The American Signal and Power company, of which Henry B. Higgins is president, has completed the test of an invention for igniting gas and gasoline engines by electricity. Heretofore, it is claimed, the machines of this kind have worked all right as long as there was no variation in speed, but when this occurred, the generators were thrown out of circuit. The device is so constructed that when an unexpected load is added, or from any cause the speed varies from the normal, the generator cuts itself out and the battery furnishes current for the electric spark.

W. J. Bonwell of St. Paul has installed two 30-kilowatt generators at Spring Valley, Minn., for the Electric Light and Investment company's sub-station. For five years a plant with a capacity of 500 incandescents was sufficient, but the growth of the place has necessitated this enlargement, which gives about 1,100 lights.

The Electric Machinery company of Minneapolis is engaged in remodeling and enlarging the electric lighting plant in the North Side pumping station of the city. A new switchboard will be put in place and some radical changes introduced. This company is also making two 20-kilowatt generators for the Gillett-Herzog company, three 10-kilowatt generators to operate the elevators in the new Andrews building and a five-kilowatt generator for furnishing light in the Swinburn flats.

The Twin City Electric works has lately installed a small dynamo and engine in the Guaranty Loan building, to provide light when the large dynamos are shut down.

Judge Johnson has dissolved the Gladstone Electric Light company, in accordance with a petition from the incorporators. J. W. Kendrick, John Woods, Ruth Tice, Edwin S. Tice and P. H. Relf were the stockholders, and the headquarters were in Minneapolis.

The St. Paul council and the Twin City Rapid Transit company have not yet reached an agreement. A new ordinance has been proposed providing for changing the Selby avenue cable line into an electric and giving it a limited franchise. Several other changes are made in the Albrecht ordinance which has caused so much discussion, the principal alterations being in regard to transfer privileges and a reservation of the right to abandon the line on Prior avenue to University.

The St. Paul Street Railway company is considering the extension of the Rice and Concord Street electric line to South St. Paul, thus affording excellent facilities to the employes of the Swift Packing company in that district.

The Swedish-American bank, at the corner of Washington and First avenues south, this city, has installed electric apparatus for the purpose of protecting the vaults. The steel safe is lined with oak and four thicknesses of tinfoil and insulated paper. If the lining is touched even so much as by a needle point it breaks the electric circuit, and a large gong fastened on the outside of the building is sounded. The alarm can be heard for blocks. The Electric Protective company put in the apparatus.

Judge Canty of the Supreme Court has given a decision in the case of Joseph Frein, respondent, against the St. Paul City Railway company, reversing the decision of the trial court. The judge holds that when a pedestrian is crossing the street he is guilty of contributory negligence unless he keeps his eyes open for approaching street cars. The application of the street-car company for a new trial is granted.

The electric plant and flour mill at Janesville, Minn., has been compelled to close down, owing to a shortage of water. The town will probably be in darkness all winter.

The municipal electric light plant at Moorhead, Minn., has a balance of $3,728.79 to its credit at the end of 11 months' operation. The council has reduced rates for lighting from $1.50 to $1 for all night and from 75 to 63 cents for 12 o'clock.

Business men of Lyons, Iowa, have formed a stock company to put in an electric light plant. A system to cost about $10,000 is proposed.

The council of Tacoma, Wash., contemplates purchasing new electric light machinery for the city plant.

Christian Burkhardt has leased the electric light plant at Hudson, Wis., to Christian Wangsgard. Mr. Burkhardt plans to operate the plant from the big dam four miles out of the city, with the opening of spring. A new power house is to be erected and other changes made at a cost of several thousand dollars.

C. K. Mead of Des Moines, Ia., says he will sue the General Electric company for $866, which he claims is due him on account of expenditures in attempting to defeat the munici[illegible]l electric lighting proposition last spring. He claims he spent $1,000 which was paid him, and also $866 which was not, and for this he sues. It is not claimed that the money was spent illegitimately.

The Electrical Workers' union of Minneapolis has elected the following-named officers for 1898: President, O. R. Shortall; vice-president, J. M. Rush; recording secretary, W. S. Haywood; financial secretary, J. L. Wolfe; press secretary, W. F. Carpenter; treasurer, J. J. Summers; foreman, J. H. McCarty; trustees, F. R. Wright, G. F. Kelly, John Supple.

The City Council of Waupaca, Wis., has granted a franchise to Paul H. Sanborn and Robert D. Wynn for an electric railroad to the Chain o' Lakes.

The council of Des Moines, Ia., has voted to set aside $20,000 for the construction and operation of the new municipal electric light plant.

The council of Fergus Falls, Minn., has purchased a 2,000 light dynamo from the receiver of the Standard Electric company of Chicago. He had only one of the kind in stock and to close it out offered it to the council for $1,000. The next lowest bid was $1,750.

W. F. Rowell and C. B. Slocum are now in charge of the electric light plant in Sturgis, S. D., and are making a number of improvements. The wiring is all being overhauled. A great improvement is noted there since the arc and incandescent systems were separated. C.

Canadian Intelligence.

Ottawa, January 10.—The Wallaceburg Electric Light company of Wallaceburg, Ont., contemplates putting in an incandescent plant in that town, having contracted to do so within eight months.

The Toronto Radial Railway bill now before the Ontario Legislature, asks for the consolidation of various local electrical railways. The lines when completed will have a radius of about 100 miles, and will run through several counties.

The Chatham City and Suburban Electric Railway company of Chatham, Ont., intends to secure the necessary amendment to its charter, in order to extend its road north and south, and it will at once push forward the work of construction.

The by-law to guarantee the sum of $50,000 for the building of an electric railway at St. Thomas, Ont., was carried by the ratepayers of that town by a large majority. Under agreement the company is bound to build 6½ miles of track.

During the fiscal year of 1896-97 the receipts for electric light inspection, in the Dominion of Canada, amounted to $6,895 and the expenditure to $9,021, of which only $1,830 was for salaries. The Ottawa Electric company is registered as maintaining 62,740 lamps in the city.

A company has been formed at St. Catharines, Ont., and plans have been matured for the purpose of building an electric railway between St. Catharines and Port Dalhousie. It is expected that the road will be completed and in operation sometime during May next. Mr. H. D. Symmes, manager of the St. Catharines and Thorold road, is the chief promoter of this enterprise.

A company in Detroit, Mich., has made a proposition to build an electric railway from the town of Amherstburg, Ont., to Windsor and Harrow, and in connection with which it demands a bonus of $15,000. Estimates for grading, bridge culverts, etc., have been made. Several bridges will be required if the road is to be proceeded with.

The Electric Light company of Dartmouth, Nova Scotia, has offered to dispose of its plant to the town for $30,000. By agreement the company is bound to give the first right of purchase to the town. The citizens' committee has replied that the plant is not suited to the requirements of the town, and it is probable that arrangements will be completed with a New York company, represented by Mr. C. K. Corsant, to purchase the plant. This company has in view the development of the water power at Fall River, at an expenditure of $100,000.

In respect to the proposed transmission plant at Goldstream, B. C., Mr. F. S. Barnard, manager of the British Columbia Electric Railway company, writes: "We have not yet definitely decided upon plans for a transmission plant. I may say, however, that our generating station will have a capacity of about 1,000 horse power, developed by water delivered under a 570 foot effective head. This power will be transmitted by a voltage of about 10,000 to the sub-section at the city of Victoria, B. C., a distance of about 12 miles, and there distributed for the purpose of street-car locomotion, arc and incandescent light and power circuits."

B. F. Pearson of Halifax, N. S., and William Mackenzie of Toronto were in Montreal recently completing arrangements for the construction of the electric street railway at Kingston, Jamaica. The work of construction is to be rapidly pushed during the winter months, so that by the next hot spell the inhabitants of that island may enjoy all the delights of rapid locomotion in hot weather, without the discomfort of personal exertion. Among those interested in this Jamaica syndicate are H. M. Whitney of Boston Mass., and F. S. Pearson of New York.

Another big electric deal has just been put through, at a cost of about $150,000. After considerable dickering the property, rights and franchises of the Temple Electric company of Montreal are about to be acquired by the Standard Light and Power company of that city. The deal was practically arranged over a month ago, but the directors of the Temple company only recently met and gave a formal ratification of the sale, which makes the Standard company one of the most important electrical concerns in Canada. Another feature of the deal is that while the Lachine Rapids Hydraulic and Land company does not supply the direct power to run individual motors, say for private lighting, elevators, etc., it will in future furnish the power to the Standard, under a contract just made, and which means the turning over of many thousands of dollars. The Lachine company has also brought to a successful consummation its efforts to supply power to the Imperial Electric company of Montreal for five years.

A comparative statement of earnings of the Montreal electric street railway shows the earnings for December to have been $113,128.91, as against $103,116.02 for the same month in the year before. The total earnings for the last three months in 1897 were $340,351.60, giving an increase over the like period in the year previous of $27,306.63.

Prominent men of Montreal recently made an excursion to Chambly, Que., for the purpose of passing an opinion upon the works of the Chambly Light and Power company. Among the number was F. S. Pearson, chief engineer of the Metropolitan Street Railway company of New York. Mr. Pearson gave it as his opinion that the Chambly plant was as perfect as any he had ever seen.

Mr. Henry Holgate, who for several years past, has managed the Montreal Park and Island railway, has resigned his position to take over the management of the West India Electric Railway company of Kingston, Jamaica. Mr. Holgate, whose work upon the Park and Island has given great satisfaction, served his apprenticeship with the Northern railway, and was chief engineer of the Northern and Northwestern railway from 1884 until 1892. Mr. Holgate will leave Montreal at once for New York, and will said for Jamaica before February 1st.

The Niagara Power company, if forced to develop power on the Canadian side of the line, must look to Toronto, it is said, for an immediate market, to which city the question of power transmission is already being considered by the company. The rival concern, which proposes to utilize the Welland River power, also looks to the city of Toronto for its most important market. The Electric Light company of Toronto, which has a large amount invested in plant for the production of electricity from steam, will not eagerly welcome the advent of water-produced power and is making a strong fight against its introduction. The people of Toronto, however, want Niagara power and want the City Council to run the electric business, and will not be satisfied until they have gained both.

The Dominion government proposes putting in an electrical installation in all the departmental buildings at Ottawa. At present the Parliament block furnishes its own electricity. The intention is to erect a power house to supply all the government buildings with electric lights and also with energy to work electric pumps for fire purposes in every building. The annual cost now for gas is $23,000, and an electric system is estimated to effect a saving of $13,000 a year. There will be about 4,000 incandescent lights in the several buildings to be supplied. The total cost is estimated at less than $80,000.

An important decision has been reached by the railway committee of the Ontario Legislature, now in session at Toronto, in passing the bill extending the time for building an extension of the Toronto electric railway through the village of East Toronto to Victoria Park. The municipality of East Toronto strongly opposed the bill. The object is ultimately to build to Highland Creek and on to Pickering, Whitley, Oshawa and Bowmanville. At present the road to York does not pay, but by extending the trolley to these eastern towns the enterprise may become a profitable one.

It is reported that an effort will be made at the coming session of the Manitoba Legislature to remove from the municipal act the clause which prevents the citizens of Winnipeg from voting on a Sunday electric street-car service by-law without the consent of the Legislature. This clause, it is alleged, found its way into the act only by a fluke, as it had been intended to vote down the motion favoring it, in committee, but through the misunderstanding of a member the arrangement miscarried

A motion has been introduced into the Ontario Legislature to the effect that, in the opinion of the House, the water power of Niagara Falls and rapids, being one of the great natural resources of the province, should be developed and utilized for the benefit of the Canadian people, and that to this end the government should favor all bona fide enterprises proposing the development of this power.

The Montreal Electric Street Railway company has just completed the printing of 15,000,000 street-car tickets. The issue cost of the tickets was in all about $1,100, and for the privilege of advertising on the back of each ticket the company received $3,000, making a clear profit of $1,900 upon the scheme. A. V. W.

PERSONAL.

R. H. Kilby, the London manager of the Armorite Interior Conduit company, died very suddenly on December 15th. Mr. Kilby was about 50 years of age and had had an extensive experience in England and Canada in the iron and steel trade. The English business of the Armorite company will be carried on by The Veritys, limited.

A handsome obelisk in memory of the late Captain Robert C. Halpin has been erected at Fitzwilliam Square, Wicklow, Ireland, and was unveiled there last October by the Viscountess Milton, wife of Viscount Milton, M. P. Captain Halpin was commander of the Great Eastern for several years, and with that [illegible] successfully laid thousands of [illegible] cable in various parts of the world.

James Graves, the superintendent of the Anglo-American Telegraph company at Valentia, Ireland, in a letter to the [illegible] London, gives some particulars of the [illegible] of his brother, Edward Graves, who was recently [illegible] at Kirwan, Persia. The [illegible] veteran in the English telegraph [illegible] he had entered the employment of the [illegible] and International Telegraph company in [illegible], when but a boy. He spent 34 years of his [illegible] and married his [illegible] wife, an Armenian lady [illegible] letter received from him by James Graves [illegible] dated New Year's Day, 1897, in which he stated that he [illegible] in Camp near Jask having left [illegible] on [illegible] 6, 1896, for the purpose of putting the land line in order, renewing insulators and stays, and removing numerous bad joints which had been burnt in the process of soldering; and he hoped to have all straight by January, 1898, and then shortly after his return to retire on his well-earned pension; "but," his brother concludes, "his hopes have been most cruelly frustrated by his recent barbarous murder." It is stated that the unfortunate man was hacked to pieces. The murder is being investigated.

ELECTRIC LIGHTING.

The good women of the Women's Christian Temperance Union in Chicago were recently disconcerted by the discovery that the isolated plant in their building, or rather the building erected under their auspices, the Woman's Temple, supplied current to a saloon in an adjoining building. The arrangement was made by the business agent of the Temple.

In London there is a street known as Electric avenue, and for many years it has attracted large crowds of South London residents as a brilliant shopping center. During the holiday season it was elaborately illuminated by the electric light to set off the displays of Christmas goods offered by tradesmen. Huge masses of foliage were utilized in the decorations, with a large number of incandescent lamps of all colors. The illumination was attractive, and made the avenue one of the sights of London, and a credit to Brixton, an extensive suburb not over-burdened with attractions.

The consolidation of the two light companies in Atchison, Kansas, has been perfected. The directors of the new company are J. P. Pomeroy, B. P. Waggener, W. P. Waggener, George Storch and J. P. Brown. The officers are: J. P. Pomeroy, president; W. P. Waggener, vice-president; C. S. Hetherington, treasurer; J. A. Bendure, general superintendent; J. M. Chisham, secretary. The Atchison Gas, Electric Light and Power company, for a consideration of $100,000, has conveyed all its property to the Atchison Railway, Light and Power company, and B. P. Waggener has conveyed Forest Park to the new company for a consideration of $25,000. The new company took possession of the consolidated plant on January 1st,. The lights of the old company will be supplied from the power house of the new company. For the present, however, and until the addition to the new company's power house can be completed, the machinery of the old company's power house will be operated between the hours of 6 and 12 p. m., to help out the new plant, which, with its present capacity, could hardly carry the load during the hours when all the lights are in use.

ELECTRIC RAILWAYS.

As a sequel to the recent generally-copied item about the woman who has been running a trolley car in an eastern city, the following dispatch from Middletown, N. Y., dated January 7th, is of interest: "Mrs. Mabel Brierley, the motorwoman of the Middletown-Goshen Traction company, was discharged to-day. The superintendent said she was a detriment and that the men on the line were dissatisfied at having a woman occupying one of their places."

The new trolley line of the Brunswick Traction company, between New Brunswick, N. J., and Bound Brook, a distance of seven miles, was formally opened last month. Edward Radel, secretary of the company, was the motorman on the first car run over the line. The farmers along the road gave the first car an enthusiastic welcome. At the farm of George W. Metlar there was a banner stretched across the road with the words: "Welcome to the Trolley." The opening of the line was of such interest to the merchants of the city, who hope for increased trade, that prizes were offered by several storekeepers to the persons first reaching the city from Bound Brook on the trolley.

TELEPHONE.

The Cumberland Telephone company has its lines completed to within 12 miles of Centreville, Md. It proposes to furnish service early in the year

War has been declared between factions of the Chicago Board of Trade over a movement to abolish telephones from the floor of the exchange. The fight is between firms having offices in the Board of Trade building and those outside the building, who rely greatly on the telephones to transact their business. Petitions and protests have been filed by members, and the question will be submitted to a vote of the members for final decision

ELECTRICAL SECURITIES.

The United Traction company of Pittsburg reports for December gross earnings, $127,504; expenses, $54,856, net earnings, $72,647, fixed charges, taxes, etc., $47,657; leaving a surplus of $24,990

Last week there was offered in New York at par $250,000 of the eight per cent preferred stock of the Electric Vehicle company of that city. The authorized capital stock of the company consists of $5,000,-000 preferred stock and an equal amount of common. Of the preferred stock only $60,000 has already been issued. The proceeds of the present offering, which is underwritten by a syndicate, is to be expended for expanding the company's plant, and no part of it for patents or franchises. The earnings of the company in excess of eight per cent. upon the preferred stock and the same upon the common are to be divided between the two classes outstanding, pro rata. One share of full-paid, non-assessable common stock will, under the terms of the present offering, be given to each subscriber to a share of the preferred stock.

Announcement is made of the placing on the market of $1,000,000 of Erie Telepgraph and Telephone company five per cent. collateral trust sinking fund gold bonds, due July 1, 1926, being part of $2,000,000, of which $1,000,000 have been sold. Both the bonds and stock of the company are quoted on the New York Stock Exchange. The company, in conjunction with the American Bell Telephone company, owns and operates the subordinate corporations conducting the Bell telephone business in Cleveland, O., and in Minnesota, North and South Dakota, and Texas and Arkansas, excepting only Duluth and the Black Hills district. The company has a capital stock of $4,800,000, upon which dividends have been paid continuously for 14 years. This issue of bonds is to provide the company with capital for extensions of its system. The net income of the company for 1897 was $365,-000, or twice the amount of its total bonded interest. The bonds are countersigned only to the extent of two-thirds of the collateral deposited under them, which collateral consists of the Erie company's ownership of the stocks of subordinate companies, and these are kept free from bonded or other indebtedness. The American Bell Telephone company owns the remaining capital of the subordinate companies, and is represented on their boards by two of its own principal officers.

MISCELLANEOUS.

It is said that the Westinghouse people are building a 750 horse power gas engine, and that one of 1,200 horse power is projected.

The report of the twentieth convention of the National Electric Light association, held at Niagara Falls, June 8, 9 and 10, 1897, is now at hand. It forms a volume of 456 pages, uniform in style with its predecessors. The frontispiece is a portrait of ex-President Frederic Nicholls. The minutes, papers and discussions of the meeting are given, and in an appendix the president's "interim reports" are given.

The report of a curious defense in a murder trial comes from Elmira, N. Y. A man named Orme was indicted for murder in the first degree for shooting James Punzo at Horseheads on July 8th at Orme's wife's house. Mrs. Orme was also shot, but she recovered. Punzo was taken to a hospital, where he died a month later. The physicians used X-rays to search for the bullet, and the defense maintained that this was the main cause of death. This plea seems to have influenced the jury, which returned a verdict of "not guilty."

TRADE NEWS.

Stanley G. Flagg & Co. of Philadelphia announce that they have opened a New York office in the St. Paul building, 220 Broadway, under the management of C. A. Jaynes.

The compliments of the National Automatic Fire-alarm company of Louisiana come to the Western Electrician in the shape of a box of lead-pencils. The company deals in electrical supplies in New Orleans.

Acknowledgment is made of the receipt by the Western Electrician of 1898 calendars from Bagnall & Hilles of Yokohama and Singapore, Morgan-Gardner Electric company of Chicago, Joseph F. Wangler of St. Louis and Alfred F. Moore of Philadelphia.

The Louisville corporation formerly known as the Sulzer-Vogt Machine company, has changed its name and is now the Henry Vogt Machine company. It will hereafter be known by that name. There will be no change of officers and the management of the company will be the same as heretofore.

Fred B. Robinson, manager of the Huntsville (Texas) Telephone company, in the course of a letter to the Western Electrician on another subject, states that he has 75 subscribers to his independent exchange at rates of $2 and $1 per month. The service is giving satisfaction to everyone, the only trouble being that Mr. Robinson cannot supply the demand for telephones. "I use the Stromberg Carlson telephone and switchboard," he adds, "and consider them the best made."

The delegates to the Northwestern convention, to be held in Milwaukee next week, will find many attractive exhibits at the Hotel Pfister. Meysenburg & Badt, Chicago, will be ably represented at the convention in the person of President F. B. Badt, assisted by R. F. Schuchardt, Rohn & Meyer and William Goltz, Wisconsin agents for Meysen-

burg & Badt. The firm will make an interesting exhibit, which will be found in a prominent place on the parlor floor of the Pfister. The exhibit will consist of new Helios alternating 100-hour lamps, also 220-volt, 2½-ampere, direct-current lamps, Hardy incandescent lamps, K. & W. specialties, the Ward Leonard Electric company's apparatus, etc.

The General Electric company will be represented at the Northwestern Electrical association convention at Milwaukee by the following-named gentlemen from its Chicago office: J. Scribner, R. A. Swain, P. A. Clisdell, F. N. Boyer, and by Thomas Ferris of Milwaukee. The General Electric company will make an exhibit, as usual at these conventions, which will consist of a full selection of wiring supplies, recording wattmeters, inclined-coil instruments, new transformers and long-burning arc lamps for direct current, alternating current, railway and power circuits. The company's headquarters will be in a special room at the Pfister Hotel, close to the clubroom where the meetings of the association will be held.

Treasurer W. H. Latshaw and President James F. Cummings of the Armorite Interior Conduit company, Pittsburg, visited Chicago last week. The Armorite company is making remarkable progress and the amount of this conduit that has been placed in New York city alone is astonishing. The company has recently brought out a new specialty in the shape of pipe for service in chemical works, salt mines and other industries where a non-corrosive pipe lining is required. The prospects for this new Armorite specialty are particularly bright, and there promises to be in it a new and profitable field for Armorite tubing. In addition to the above the company is also pushing a branch of business devoted to the manufacture of tubing trolley poles. In a word, the Armorite Interior Conduit company, with its splendid facilities for furnishing conduit of all kinds, is doing a business to be proud of.

The Dearborn Drug and Chemical Works, 31-33 Rialto building, Chicago, offer their services to all steam users as manufacturing and analytical chemists, whose specialty is the preparation of vegetable boiler compounds to prevent the formation of scale. Waters are analyzed free and the indicated compound for each is prescribed. In a little pamphlet issued by the company its position is thus outlined: "With an extensive and completely equipped laboratory, we are able to handle this subject, making preparations to overcome the different known deleterious actions taking place in the steam boiler, in a scientific manner, by analyzing the feed-water and making a diagnosis of the case at hand. We have no proprietary article on hand, but after learning with what we have to contend, we write a prescription for the ingredients and give such directions as will be suitable for the water used under the given conditions. This prescription is sent to our works, where it is filled, filed, recorded and numbered, and can be refilled when wanted, the same as a prescription is handled by a dispensing pharmacist in a drug store. In this way we are handling the subject in an intelligent and systematic manner, getting at the root of the existing evil, overcoming the difficulties and insuring the safe and economical running of steam boilers and all other receptacles. These methods also enable the steam user to always obtain identically the same especially-prepared and uniformly made preparation." The company also analyzes coal for its clients.

BUSINESS.

The Hobart Electric Manufacturing company of Troy, O., manufacturer of dynamos and motors and general electrical supplies, reports a healthy activity in its business for the beginning of the new year. It is sending its apparatus all over the country, and had to work nights all during the month of December.

A. M. Searles, manager of the Diamond Electric company, Chicago, states that his company has just placed on the market a new induction meter for light and power which is already meeting with great favor. This meter is said to possess a number of new and important features not to be found in other makes. The perfect workmanship and general reliability found in the products of the Diamond company has secured for it a large trade among users of electrical instruments.

Armorite interior conduit is now generally recognized by architects and contractors as a standard for all high-grade interior work. This conduit, as now made with the light steel wall and light lining, is superior to the old-style heavy conduit and is claimed to be displacing entirely the old type of tubing. The Electric Appliance company is carrying a large stock of light-wall steel Armorite in Chicago and is doing a handsome business. It claims that Armorite is easier to install than any other conduit that has yet been placed on the market.

The McDermid Manufacturing company, 207 South Canal street, Chicago, has just placed on the market an article which should appeal to every manager in the electrical business. It is a preparation which will remove dust, dirt, oil and grease from brass, woodwork, etc., and is already used largely by street-railway and lighting companies. Telephone managers can greatly improve the appearance of their exchanges by the use of this article, it is claimed. Further information will be furnished by the McDermid company on request.

L. F. Seybert's Sons of 437 North Third street, Philadelphia, who have for many years made a specialty of second-hand machinery, have recently added an electrical department, and have published a list of second-hand dynamos, motors, arc lamps, etc., which merits the investigation of a prospective purchaser of this line of electrical aparatus. This concern has been in business for over 30 years, and its reputation for business dealings has always been that of the best. The firm's list of second-hand electrical apparatus has recently been published, and is now ready for distribution.

H. B. Coho & Co. of 220 Broadway, New York, report that their business for the last year has been greatly in excess of that which was anticipated, especially the last six months, which was nearly double that of the same previous term of the year. This concern is rapidly forging ahead in the vicinity of New York as a contractor to install complete electric plants. Being able to install the Oswego boilers, the Eddy motors and dynamos, and the Warren alternators, Coho & Co. have the basis of being able to deliver an outfit from 50 lights up. The success which has attended the efforts of H. B. Coho & Co. is well merited, from the fact that their motto in business has been "A customer well served is two friends made in business."

The Filer & Stowell company, the Milwaukee engine builder, is busy. It is now building a 500 horse power cross-compound engine for the electric light plant for the city of Jacksonville, Florida. The engine is to be an exact duplicate of the two cross-compound engines furnished by the company for the electric light plant at Garfield Park, Chicago. The company is also building two engines for the electric light plant for the city of Donaldsonville, La., and a 1,000 horse power tandem Corliss engine for the new flour mill of the Eckhart & Swan Milling company, Chicago, and has just shipped an engine for the Minnesota elevator which Armour & Co. are erecting on Goose Island, Chicago, and a tandem of 250 horse power for the Riverside Fiber company, Appleton, Wis. Two cross-compounds of 300 horse power each have just been shipped for the new plant which Swift & Co. of Chicago are erecting at St. Joseph, Mo., while a single-cylinder engine for the electric light and water-works plant for the city of Brookhaven, Miss., and another for the city of Port Gibson, Miss., have also been shipped.

Much trouble and anxiety is caused by the deterioration of iron and steel pipes for conveying salt-water, sulphur, and other liquids in mines, salt wells, chemical works, etc. Several schemes have been advanced to prevent this rapid deterioration, which is very expensive. Pipes have been galvanized and coated with several materials; but none as yet have, it is believed, proven thoroughly satisfactory. The friction and "eating" of the liquid directly on the metal, soon honeycombs the pipe and renders it useless, thereby causing considerable expense as well as delay in replacing the line. The Armorite Interior Conduit company of Pittsburg is manufacturing "Armorite"— a wood-lined tube which, it is claimed, entirely overcomes this difficulty. An ordinary iron or steel pipe is employed and a wooden tube is forced into it that has been thoroughly treated to prevent the corroding liquid from penetrating it. The inside tube can be cut any desired thickness from one-sixteenth inch up; is made to fit perfectly tight in the metal pipe with flush joints, and it is coupled up in precisely the same manner as pipe would be lined. With this construction of tube, the liquid forced through the pipe does not come in contact with the metal, and has, it is stated, no effect whatever on the lining; thereby greatly increasing the life of the iron pipe, which would only be used for additional strength and mechanical protection. Those interested in this process may obtain free samples for inspection. The Armorite piping for this purpose is furnished at present in all sizes up to six-inch pipe, with larger sizes preparing.

ILLUSTRATED ELECTRICAL PATENT RECORD.

Issued January 4, 1898.

596,483. Electric Fan. Oliver F. Conklin, Springfield, Ohio. Application filed June 17, 1897.

The motor is inclosed in a cylindrical casing and the armature and field coils are especially adapted to this construction.

596,496. Telephone. William Gray, Hartford, Conn. Application filed April 20, 1896.

Features enumerated are a transmitter, a sound passage to the transmitter diaphragm, a signal box and a tubular connection between the signal box and transmitter case forming a signal passage, having a deflector located outside of and with its outer surface flush with the wall of the sound passage.

596,506. Electric Switch. Warren S. Hill, Hyde Park, Mass. Application filed May 1, 1896.

The blade of a knife-switch has a recess near the end with an opening leading therefrom through the end of the blade to the exterior of the blade. There is a yoke, an insulating block placed intermediate of the blade and yoke, a nut seated in the recess formed in the blade and a screw passing through the yoke, insulating block and the opening in the end of the blade and engaging with the nut.

596,509. Signaling Apparatus for Telephone Systems. Frank J. Holmes, Cleveland, Ohio. Application filed March 25, 1896.

The first claim reads as follows: In a telephone or telegraph system, the combination of a device for varying the resistance in the line circuit one or more times, an electrically operated signal indicator connected in a local circuit, a plurality of devices which are adapted when connected severally in said local circuit to vary the resistance in said circuit according to a code, and mechanism adapted to be operated by varying the resistance in the line circuit for connecting in the local circuit any desired one of said devices.

596,512. Automatic Stop-motion Snap Switch. John D. Ihlder, Yonkers, N. Y. Application filed August 11, 1896.

An arrangement of gearing so that on moving the traveling operating means in one direction the connections will initially operate the switch and then permit the continuous movement of the traveling operating means without affecting the movement of the switch, but will, however, initially operate the switch on a reversal of the movement of the traveling operating means.

596,513. Compound Brake for Electric Elevators. John D. Ihlder, Yonkers, N. Y. Application filed September 14, 1896.

One claim is for the combination with the brake device of an elevator engine, of an eccentric, connections with the eccentric whereby it can be controlled by the operator, a strap mounted on the eccentric, a rod connected to the strap, a socket mounted on the brake device and a spring interposed between the strap and socket.

596,514. Safety Magnet Brake. John D. Ihlder, Yonkers, N. Y. Application filed September 21, 1896.

The mechanical part of this device comprises a band bearing on a pulley, a bearing connected to the band, a weight mounted on the bearing and a cam on the bearing. There is also a magnet, the armature of which is provided with a cam engaging the cam on the bearing, whereby the weight may be released and again set to its normal position.

596,515. Starting Box for Electric Motors. John D. Ihlder, Yonkers, N. Y. Application filed October 11, 1897.

The combination with the switch of a shaft, an arm connected to the shaft for operating the switch, a resistance device in the circuit, a brush carrying arm loosely mounted on the shaft, and connections between the arms, whereby when the switch operating arm is moved in one direction the brush-carrying arm is free to operate, and when it is moved in the other direction it is moved with the switch-operating arm.

596,567. Converter for Monophase Currents. Andre Blondel and Gaston Sautter, Paris, France. Application filed June 27, 1895.

A converter for the transformation wholly or partially of a monophase alternating current into a continuous current, or vice versa, comprising an armature carrying two windings, a primary winding fed by the alternating current to be transformed, and a secondary winding delivering the continuous current through a commutator, this armature being surrounded by a magnetic circuit formed by a fixed frame carrying a closed coil tertiary winding set in the pole-pieces, the tertiary winding having for its object to transform the simple alternating field into a constant field fixed in space.

596,582. Means for Varying Candle Power of Incandescent Electric Lamps. Charles E. Felch, Natick, Mass. Application filed June 21, 1897.

In a socket for incandescent electric lamps a rotatable shell, a carrier of insulating material mounted therein and having a recess, a permeable resistance medium held in this recess, an electrode adapted to be extended into this medium, and means connected with and actuated by rotation of the shell to effect relative movement of the electrode and carrier within the shell, and thereby extend the electrode into the resistance medium to different depths, the medium and the electrode being in electrical circuit with the lamp filament and the line.

596,600. Supervisory Signal for Telephone Switchboards. Frank R. McBerty, Downer's Grove, Ill. Application filed October 26, 1896.

This device is described as the combination with a telephone line and means for altering its electrical condition of a signal indicator associated with the line, a magnet controlling the indicator responsive to currents in the line, an appliance whose position or condition is altered during connection with the line and a mechanical device actuated in the movement of the appliance adapted to act upon the indicator in the same manner that the magnet does.

596,610. Signaling System for Telephone Trunk Lines. Frank R. McBerty, Downer's Grove, Ill. Application filed November 24, 1896.

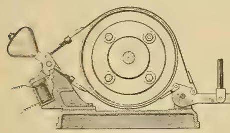
The first claim is quoted: The combination with a subscriber's line terminating in a spring-jack, a trunk line and a plug connected with the trunk line and adapted for insertion into the spring jack, of a signaling circuit including a clearing-out signal at the distant terminal of the trunk line, said signal being adapted to be displayed when its controlling magnet is inert, the signaling circuit being completed through registering contact pieces of the subscriber's spring jack and the plug therein, and a source of current permanently connected with the signaling circuit to excite the signal-controlling magnet, whereby the withdrawal of the plug from the spring jack causes the display of the clearing-out signal.

596,625. Plug and Spring-jack for Telephone Switchboards. Charles E. Scribner, Chicago, Ill. Application filed November 29, 1895.

The combination with a spring-jack having a tubular contact thimble and a contact spring, of a plug having a contact ring for the contact spring and an insulating ring of larger diameter than the contact ring placed before the contact ring, whereby the ring is prevented from touching the contact thimble.

596,626. Spring-jack for Telephone Switchboards. Charles E. Scribner, Chicago, Ill. Application filed May 14, 1896.

In a spring-jack with a base plate of insulating material having a transverse groove formed therein there is combined a group of line springs and anvil straps, with interposed tongues of insulating material lying on edge in the groove, lateral extensions from the anvil straps and from the tongue between them near the anvils of the straps, and a recess in the floor of the groove adapted to receive and fit tightly the extensions.



NO. 596,514.

596,627. Annunciator for Telephone Lines. Charles E. Scribner, Chicago, Ill. Application filed May 14, 1896.

With a closed signaling circuit there is an annunciator having its winding together with a resistance coil in the signaling circuit, a source of current in a normally open shunt about the resistance coil, switch contacts in the annunciator actuated by the excitement thereof to close the shunt and a switch adapted to break the circuit of the battery through the annunciator.

596,628. Supervisory Signal for Telephone Switchboards. Charles E. Scribner, Chicago, Ill. Application filed November 16, 1896.

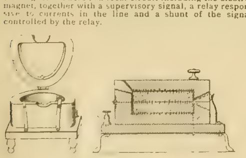
The combination with an operator's plug circuit, a listening key and the supervisory signals having signal-controlling magnets included in the plug circuit adapted to conceal the indicators of the signals when excited, of a mechanical device connecting the key with the indicator actuated by the key in connecting the telephone to the plug circuit adapted to conceal the indicators of the supervisory signals.

596,629. Testing Apparatus for Multiple Switchboards. Charles E. Scribner, Chicago, Ill. Application filed December 8, 1896.

The first claim describes the combination with a telephone line, spring-jacks therefor in different sections of a multiple switchboard and test contacts in the spring-jacks, of a relay responsive to currents in the line and a signal controlled thereby, a cut-off relay adapted to interrupt the current through the signal-controlling relay when excited, and means for applying current to the cut-off relay in the act of making connection with the spring-jack, a source of electric current and a circuit therefrom to the test rings closed by switch contacts actuated by the signal-controlling relay, whereby the circuit connecting the battery with the test rings is closed when the signal-controlling relay becomes excited, and it is broken when connection is made with the line.

596,630. Apparatus for Telephone Switchboards. Charles E. Scribner, Chicago, Ill. Application filed December 8, 1896.

In this apparatus an electro-magnet is associated with the telephone line, with mechanism actuated by the electro-magnet. There is a local circuit including the electro-magnet, together with a supervisory signal, a relay responsive to currents in the line and a shunt of the signal controlled by the relay.



NO. 596,606.

596,654. Process of Producing High Vacuums. Elmer F. Deyer, Lynn, Mass. Application filed October 26, 1897.

The process consists in the case of an incandescent lamp of removing the bulk of the original gas by pumping, further expanding by heat the remaining gas and continuing the pumping, passing an electric current through the lamp [illegible] for dis[illegible]ging occluded or retained gases therefrom and [illegible] phosphorus [illegible] is applied to the connection while continuing the pumping and then finally sealing off the lamp.

596,672. Apparatus for Plate Glass Pictures. Karl Wirth, Nuremberg, Germany. Application filed December 17, 1896.

In this apparatus, applicable to show window display, there is [illegible], having it [illegible] to such a degree as to render it [illegible] reflecting objects, a picture mounted [illegible] and indistinguishable through the [illegible] condition, and an electric light [illegible] the picture and provided with means for lighting and extinguishing, whereby the picture may be [illegible] intermittently by intermittently [illegible] the light.

596,680. Alarm [illegible] Percy C. Howe, Boston, Mass. Application filed April 15, 1897.

The combination of an alarm clock, a thermostat, means operated by the thermostat for releasing the alarm train of the clock and of a circuit breaker operated by the alarm train.

596,696. Electric Oven. Levitt E. Custer, Dayton, Ohio. Application filed March 16, 1896.

This electrically heated oven has a heating chamber, walls of suitable materials, two apertures in such walls, one to allow light to enter the heating chamber and the other to permit observation of the interior, two or more electrical conductors embedded in the walls of the oven of substantially uniform resistance per unit of length, the conductors being arranged in the bottom and top halves of the walls in loops which are at progressively increasing distances apart as they near the center of the chamber, means for automatically making electrical connection between the conductors, means for placing the conductors in circuit with the heating current, and means for opening the oven to expose the heating chamber.

596,719. Magnetic Ore Separator. Lewis G. Rowand, Camden, N. J. Application filed April 15, 1897.

In a magnetic ore separator, the combination of a conveyer belt adapted to convey the material to be treated, a discharging belt passing over and beyond and at an angle with the conveyer belt, a magnet above the belts at the crossing point and extending above the discharge belt beyond the conveyer belt, the pole-pieces of the magnet extending along the discharging belt, the distance between the pole-pieces increasing along the discharging belt beyond the conveyer belt.

596,720. Magnetic Ore Separator. Lewis G. Rowand, Camden, N. J. Application filed April 15, 1897.

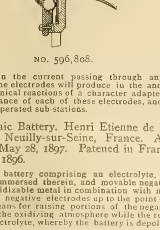
There is a conveyer and a magnet above it and adjacent to it. The pole-pieces of this magnet extend toward each other at their ends and are provided with an open-bottomed space between the free ends of the pole-pieces, the ends of the two pole-pieces being covered with non-magnetic material extending above their upper surfaces.

596,729. Support for Electric Lamps. Otis C. White, Worcester, Mass. Application filed February 16, 1897.

The combination of a support, a pipe pivotally connected thereto, a ball secured to the end of the pipe, an electric lamp fixture, a ball connected thereto, yoke-pieces and a single-clamping device for adjustably clamping the pieces into engagement with the balls.

596,774. Electric Signaling Apparatus. Felix B. Herzog, New York, N. Y. Application filed May 31, 1895.

An annunciator comprising a receptacle containing a transparent electrolyte and a series of electrodes located therein, visible therethrough and corresponding to a series of sub-stations, separate lines connecting these electrodes to the various sub-stations, a circuit-controlling device located at each sub-station and adapted to control the flow of current through its own line and electrode, the electrode and electrolyte being relatively so constituted that



NO. 596,808.

variations in the current passing through any one or several of the electrodes will produce in the annunciator electro-chemical reactions of a character adapted to vary the appearance of each of these electrodes, and thereby locate the operated sub-stations.

596,791. Voltaic Battery. Henri Etienne de Rufz de Lavison, Neuilly-sur-Seine, France. Application filed May 28, 1897. Patened in France October 15, 1896.

A voltaic battery comprising an electrolyte, positive electrodes immersed therein, and movable negative electrodes of oxidizable metal in combination with means for heating the negative electrodes up to the point of oxidation, and means for raising portions of the negative electrodes into the oxidizing atmosphere while the remainder is in the electrolyte, whereby the battery is depolarized.

596,806. Apparatus for Telephones. Frank B. Cook, Chicago, Ill. Application filed March 17, 1896.

In a telephone system in which a plurality of subscribers are connected in one circuit a central switchboard, means for preventing a false signal consisting of calling-generators at each subscriber's station, signal bells for each subscriber's station unresponsive to the current from the calling generators of the subscribers, signaling devices at the central switchboard operated by the current from the subscribers' generators, and a central switchboard generator to the current from which the signal-bells of the subscribers are responsive.

596,808. Telephone Transmitter. David A. Fleming, Indiana, Pa. Application filed April 12, 1897.

A tube or channel is mounted to turn adjacent to the diaphragm and inclined relatively to the axis of rotation, the tube being mounted to turn without affecting the fastening of the diaphragm, and loose conducting material, such as balls, is provided in the channel, engaging the diaphragm.

596,812. Subterranean Electric Conduit. William D. M. Howard, Redwood City, Cal. Application filed June 18, 1897.

The form of conduit is provided with a slot or channel with a hollow tube interior to the conduit having a channel in its bottom and inturned edges forming guide rails, vertical standards fixed in the conduit and passing through the channel of the tube and into the interior of the tube, and secured to the inner circumference thereof, trolley wires or rods within the tube and supported from the standards and a plow having guide wheels to engage the inturned edges of the tube.

596,834. Telephone Transmitter. James H. Spencer and Malcolm S. Keye[illegible], New York, N. Y. Application filed January 14, 1897.

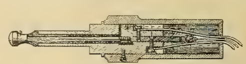
The transmitter is provided with buttons having their opposing faces formed with concentric grooves, and a transmitting device held loosely between the buttons and comprising a disk having pins projecting from its faces to engage the faces of the buttons.

596,850. Telephone Switch Plug. Frank B. Cook, Chicago, Ill. Application filed January 4, 1896.

A plug for complete metallic circuits consisting of a main body portion, comprising a head and conductor-holding members or sections insulated from each other, an insulating partition for insulating the sections, binding screws in each of the sections located on each side of the partition, and conductors led and secured to the screws, whereby the partition isolates the conductors to prevent short-circuiting, together with a conducting sleeve connected with the head of the plug, and a conducting stem connected with one of the conductor holding sections.

596,851. Telephone Apparatus. Frank B. Cook, Chicago, Ill. Original application filed November 30, 1894. Divided and this application filed October 23, 1895. Renewed October 25, 1897.

One claim provides for a combined ringing and listening key, consisting of a supporting frame including a base-piece held therein, spring-contacts mounted in the base and



NO. 596,850.

projected upward therefrom, inner and outer conducting frames and spring-contacts held by the frames, together with a listening-key lever centrally positioned, and ringing-key buttons located at either side of the lever, each one of which is operable independently of the other.

596,852. Switch for Telephone Circuits. Frank B. Cook, Chicago, Ill. Original application filed March 25, 1895. Divided and this application filed December 1, 1896. Renewed October 25, 1897.

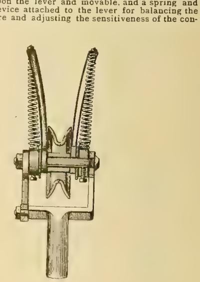
A pair of crossed springs is adapted for contacting at two points on the opposite sides of each, and means are provided for operating the springs to establish or disestablish the contacts.

596,907. Electric Cable for Propulsion of Vehicles. Addison Norman, Toronto, Canada. Application filed July 8, 1896.

The supply conductor is made of one or more strands of wire, and covered throughout its whole length with insulating material, except where it is inclosed by short metal switches, with the working conductors and switches knit into one rope.

596,923. Automatic Potential Regulator for Dynamos. Allen A Tirrill, Whitefield, and Phill S. Tirrill, Groveton, N. H. Application filed May 1, 1897.

This apparatus consists of one or more vertical solenoid coils arranged in a branch of the main supply circuit, a vertical core for each solenoid, a lever fulcrumed above and outside of the solenoid and attached to and suspending the core of the solenoid, contact points arranged as terminals to a shunt from the field-magnets of the dynamo, one of the contact points being stationary and the other mounted upon the lever and movable, and a spring and adjusting device attached to the lever for balancing the solenoid core and adjusting the sensitiveness of the contacts.



NO. 596,926.

596,926. Trolley Guard. Herman J. Vogler and Alfredo Flores, San Antonio, Texas. Application filed October 16, 1897.

The combination with the trolley wheel and its axial bolt of bowed or loop-shaped guards hung loosely on the axial bolt on each side of the trolley wheel, and a spring on each side connected at one end rigidly to the axial bolt and extending radially into the bow of the guard and secured within the bow to the middle of the outer portion of the same.

596,943. Electric Clock. Frederic Richard, Lynn, Mass. Application filed August 21, 1896. Renewed November 24, 1897.

The motion of the balance-wheel is electrically transmitted to the clock mechanism.

596,955. Automatic Temperature Regulator. Addy A. Boss, Detroit, Mich. Application filed March 31, 1897.

In this device an electric circuit having a circuit-closer therein, an electro-magnet, movable armatures, a valve-case and a valve therein, a lever for actuating the valve, and a connection coupling the armatures to the valve-actuating lever are enumerated. The connection is of such a character as to permit the armatures to attain their maximum velocity when attracted before acting upon the lever.

Western Electrician.

EVERY SATURDAY.

Vol. XXII. CHICAGO, JANUARY 22, 1898. No. 4

M. K. Bowen, President Chicago City Railway Company.

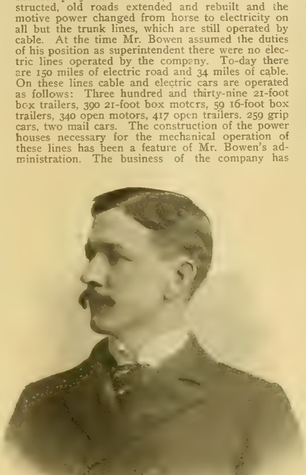
At the annual meeting of the Chicago City Railway company on Saturday, January 15th, Menard Kenner Bowen was elected president to succeed George H. Wheeler, who announced his decision to withdraw from the active management of the South Side railway system. This action had been anticipated for some time, and consequently little surprise was manifested in street-railway circles over the change, although Mr. Bowen's advancement in the service of the company has been unusually rapid. He has been identified with the corporation only six years, and in that time has risen from the comparatively obscure position of assistant superintendent to the presidency of the company. He is undoubtedly the youngest man in the street-railway world holding such an important position, but that he is qualified to administer the office is universally admitted by those who are familiar with his record as superintendent and general manager. Before he came to Chicago he had had practical experience in the management of street-railway properties, and his duties with the South Side company have broadened his views, and to-day he is considered one of the best equipped street-railway managers in the country. As yet there has been no official announcement of the policy of the new administration, but it is anticipated that many changes will be made and that the general attitude of the company will be much more aggressive than heretofore.

The new president of the Chicago City Railway company is a severe disciplinarian, and this characteristic may be traced to his early training. He was born in Jefferson Barracks, Mo., the army post on the Mississippi River, 10 miles below St. Louis, in 1858. He was the son of General John S. Bowen, who was graduated at West Point, and a grandson of Pierre Menard, the first lieutenant-governor of Illinois. He received his early education at the St. Louis University and later took a course in engineering at the Washington University in St. Louis.

At the age of 19 Mr. Bowen entered the service of the United States government as assistant engineer on a triangulation survey of the Mississippi River, and later he was made assistant engineer of the jetty work in the harbor of New Orleans and the pass. In 1880 the St. Louis and San Francisco Railway company placed him in charge of the topographical survey from Fort Smith, Ark., through to California. He was engaged in this and similar work for several years and then drifted into the street-railway field, which was just at that time attracting attention among capitalists and engineers, as the possibilities of mechanical propulsion in city traffic were becoming apparent.

The scene of Mr. Bowen's first important undertaking in the new field was Kansas City, where he became chief engineer and superintendent of construction of the Kansas City Railway company, which was building its cable lines at that time. He was successful in this enterprise, and when the road was completed he was retained as general superintendent of the system. This was an entirely new field, but Mr. Bowen was as successful in the operation and management of transportation property as he had formerly been in designing and constructing it. In spite of the limited field in which he was occupied, Mr. Bowen's ability and enterprise attracted attention, and he received many flattering offers. The Short Electric Railway company of Cleveland, which was at that time engaged in introducing Prof. Short's single-reduction and gearless motors for street-railway service, induced Mr. Bowen to enter the commercial field as its New York representative. His record with the Short company was very creditable to him and satisfactory to the company.

At this time the Chicago City Railway company was looking for a practical and experienced street-railway man to assist Mr. Holmes, who then had entire charge of the management and operation of the South Side system. The company was introducing the cable in State street and Cottage Grove avenue, but the remainder of the system comprised horse-car lines. Mr. Bowen's experience as an engineer and the ability he had already displayed in building and operating the Kansas City road, and his familiarity with the electrical system as well, commended him to the Chicago company, and he was appointed assistant superintendent. This arrangement proved satisfactory, and one year later, when the reorganization of the company took place, Mr. Bowen was promoted to the position of superintendent, which he held until last year, when the office of general manager was created, and he was the first to fill it. In all this time, it may be mentioned, Mr. Bowen did not appoint an assistant superintendent, in spite of the fact that his duties and responsibilities were constantly increasing. During the last few years, it may be remarked, he has had practically entire charge of the Chicago City Railway company's system. During the five years that he filled the positions of superintendent and general manager many changes and extensions were made, methods of conducting the business of the company were revised, new lines were constructed, old roads extended and rebuilt and the motive power changed from horse to electricity on all but the trunk lines, which are still operated by cable. At the time Mr. Bowen assumed the duties of his position as superintendent there were no electric lines operated by the company. To-day there are 150 miles of electric road and 34 miles of cable. On these lines cable and electric cars are operated as follows: Three hundred and thirty-nine 21-foot box trailers, 390 21-foot box motors, 59 16-foot box trailers, 340 open motors, 417 open trailers, 259 grip cars, two mail cars. The construction of the power houses necessary for the mechanical operation of these lines has been a feature of Mr. Bowen's administration. The business of the company has



M. K. BOWEN.

greatly increased owing to natural growth and somewhat to the change in motive power and extensions by which better service is secured. During the last year the company operated 24,37[illegible],000 car-miles, carrying 95,621,112 passengers and earning $4,781,055. This was an improvement over the previous year.

Under Mr. Bowen's direction the rails throughout the entire system have been cast-welded. The experience with this construction has been thoroughly satisfactory. An innovation in street-railway practice introduced by Mr. Bowen was the use of a dynagraph car, which is an ordinary car equipped for the purpose of det rmining and showing the condition of the track over which it passes. The test enables the management to determine just how much money will be required to reconstruct the track and put it in first-class shape. Mr. Bowen described this device and the method of operation and related the results which he had obtained through its use in a paper on "Track and Track Joints" before the American Street Railway association at St. Louis in October, 1896. This paper was printed in the Western Electrician, November 7, 1896, and attracted attention abroad as well as in this country. It was generally agreed that the dynagraph was an important addition to the equipment of every well-conducted street railway, and it is now in general use in all large cities. The beveled-head rail first adopted by this company resulted in the saving of the difference between 7½ and 3⅞ car wheels per day, as the average output of the repair shops. It may be mentioned here that many interesting and valuable labor-saving devices have been introduced in the shops and many economies practiced since Mr. Bowen took charge of the system. In the early days of cable railroading, for instance, it was necessary to take the grips out of the grip cars on the street, thus blockading the line, and draw the grip cars by horses into the car barns. They were taken out in the same manner, and the trains were made up on the street. This crude method cost about $34 at each barn per day for labor and resulted in numerous delays and blockades to service. The barn floors are now elevated 4½ feet above a sub-floor and are 16 inches higher than the street track. The trains are made up, grip hanging in place, and run out of the barns by gravity and run into the barns by momentum taken from the cable. The change has not only effected a material saving in the cost of operation, but it has greatly relieved the congestion at the car barns and facilitated the service.

Mr. Bowen has kept constantly in touch with the several departments over which he has had supervision, and one of the means he has employed has been the holding of weekly conferences with the heads of departments. These assemble at a determined time and place and devote an hour to the discussion of some practical topic of importance.

During Mr. Bowen's connection with the South Side company he has had many difficult and vexatious subjects to consider. His course has been upheld on all occasions by the directors, and, although he has at times departed from the path of the conservative management that had come to be looked upon as the fixed policy of the corporation, his action has found favor with the controlling spirts in the company. It is not at all improbable, therefore, that with complete control Mr. Bowen will soon introduce changes in the management that will make it more aggressive than heretofore.

New York Electrical Society.

On January 12th the New York Electrical society had its 184th meeting at the College of the City of New York, where most of this season's meetings will be held. Mr. S. Dana Greene read an interesting paper on "The Relations between the Customer, Consulting Engineer and the Electrical Manufacturer." This paper is begun on another page.

The members elected were: Otto Rothenstein, Otto Electric company, Times building, New York city; F. K. Vreeland, 228 Orange road, Montclair, N. J.; F. V. Henshaw, 79 State street, Brooklyn, N. Y.; S. L. Griswold Knox, Crocker-Wheeler Electric company, Ampere, Newark, N. J.; John Neilson, Larchmont Electric company, Larchmont, N. Y.; Putnam A. Bates, 113 West Seventy-second street, New York city; E. E. Higgins, 36 Cortlandt street, New York city; Thomas A. Edison, Jr., 96 Broadway, New York city.

At the request of the president the secretary read the following announcement:

"For some time past, the New York Electrical society has been considering means for enlarging its scope of usefulness and addressing a larger clientage among the citizens of New York, so as to bring the public into more intimate relations with the scientific aspect of all classes of electrical work. The proposition to hold an electrical exhibition at Madison Square Garden next May appeared to the society to afford it the needed opportunity for putting itself prominently before the public as the oldest electrical body in the country, and the recognized local society, aiming by papers and discussions to diffuse the best electrical information.

"The Electrical Exhibition has very promptly and generously met the views of the New York Electrical society, and has not only apportioned it space in the exhibition hall for a booth and rendezvous for its members and friends, but has also placed at its disposal a contribution of funds for its educational work. This amount will be increased by a percentage of the admission receipts of the exhibition, which is to be held under the auspices of the New York Electrical society. Members of the society will be admitted to the exhibition at half price.

"It is believed, from what is already known, that this exhibition will surpass anything of the kind ever done in this city, and will, during the continuance of a month, not only do much to promote electric interest, but enable the society to reach a great many thousand people who should know of

its work, and many hundreds who should unquestionably be in its membership.

"The Electrical society is now organizing committees and laying plans for a hearty and active co-operation in the work of the exhibition, and looking, of course, to its own increase of membership and its fuller recognition as an authoritative, influential body.

"It is hoped and expected that this will mark the beginning of one of the most successful steps ever taken by the society, and approving comments of friends and members encourage the executive committee to believe that they will be enthusiastically supported in the programme, the sole object of which is to increase and extend the society's usefulness. The officers would, therefore, not only urge the members of the society, individually and collectively, to assist in making the exhibition as brilliant a success as possible, for the direct benefit that such success will confer on the society, but also wish to impress on members the desirability of active co-operation, with a view of increasing the membership (a membership which, now standing at 400, should be at least a thousand before the year is out).

"It has been suggested that the advisory committee of the society, representing its interests, with the officers of the exhibition, and for other exhibition purposes, should consist of the present officers [M. I. Pupin, George H. Guy and Henry A. Sinclair] and all the living ex-presidents, namely: Frank W. Jones, John M. Pendleton, Francis B. Crocker, Joseph Wetzler, C. O. Mailloux, John W. Lieb, Jr., and C. E. Emery, all of whom, it is understood, will gladly co-operate in this movement to develop work to which they themselves have so actively contributed in past years."

A resolution approving the arrangement with the Electrical Exhibition and pledging support to it was adopted.

George O. Nagle.

A. C. Heidelberg.

NEW OFFICERS OF THE CHICAGO CITY RAILWAY COMPANY.

New Officers of the Chicago City Railway Company.

One of the first acts of President Bowen of the Chicago City Railway company was the appointment of a superintendent to perform part of the work that had formerly been borne on his own shoulders. For this position he named George O. Nagle on Tuesday, and the appointment was confirmed by the directors. The position of assistant superintendent was created, and A. C. Heidelberg was appointed to fill it. Both appointments are in the line of promotion, and both give satisfaction. Mr. Nagle has been thoroughly trained in Mr. Bowen's office in the executive supervision of the road, and several years' experience has fitted Mr. Heidelberg to look after the practical details of construction, maintenance and car operation.

George O. Nagle, the new superintendent, is a young man for so responsible a position. He was born in Milton, Pa., on December 31, 1868. He received his education principally in the public schools of Lima, O., to which town his family removed when the boy was seven years old. In the fall of 1886 the Nagles came farther West, removing to Chicago, where George attended the Athenæum. The young man started out to make his own way in the world the year following, securing employment with the Cragin Manufacturing company. A few months later he obtained a position in the office of the general auditor of the Chicago, Burlington and Quincy Railroad company, remaining there for nearly four years.

On February 8, 18[illegible], Mr. Nagle entered the service of the Chicago City Railway company as assistant to M. B. Starring, assistant general counsel of the company. Later in the [illegible] year he became private secretary to [illegible], then the superintendent of the system, but succeeded two weeks later by M. K. Bowen. Mr. Nagle continued in the same capacity under Mr. Bowen for over [illegible] years. As the importance of Mr. Bowen's duties increased with the growth of the system, the usefulness of his quick, intelligent and tactful secretary likewise became more apparent. A year ago Mr. Bowen was made general manager, and from that time, and indeed for several months previous, Mr. Nagle was virtually assistant superintendent. He acted in Mr. Bowen's absence and looked after much of the detail work in the office. He is thoroughly familiar with all the work of the operating department, and so, upon Mr. Bowen's advancement to the position of president, Mr. Nagle's promotion to the position of superintendent comes as a deserved recognition of faithful and efficient service.

In 1894 Mr. Nagle organized the Chicago City Railway Employés' Mutual Aid association. He became the first president of the organization and has been re-elected regularly ever since. This association has 2,100 members and maintains a benefit fund sustained by small assessments, from which the family of each deceased member receives $500. The average cost to each member of each death is 25 cents, and there were 12 deaths in the year ended October 1, 1897. At that time the aggregate insurance in force was over a million dollars, and there were over 400 members who had left the company's employment but still paid dues and assessments regularly. The president of this association is elected by a board of directors chosen by the men themselves, and it is a noteworthy fact that Mr. Nagle was re-elected last October, without opposition, at a time when the strike talk was at fever heat. Mr. Nagle strives to be entirely fair and impartial in dealing with the men, who recognize the fact.

The new superintendent is as yet unmarried, and lives at home with his mother and sisters.

A. C. Heidelberg, the assistant superintendent, has had the best kind of training for his new position. Successively, he has been gripman, assistant supervisor, depotmaster and trackmaster. He held the last-named position for two years before his recent promotion. Mr. Heidelberg is thoroughly versed in the practical details of the operating department of the great company with which he is connected.

Chicago City Railway Company's Annual Meeting.

At the annual meeting of the Chicago City Railway company, Saturday, January 15th, George H. Wheeler resigned as president and M. K. Bowen, general manager, was elevated to the position made vacant. He will hereafter combine the duties of president and general manager. William B. Walker was elected first vice-president, to succeed James C. King, resigned, and Joseph Leiter was made second vice-president, to succeed E. M. Phelps, resigned. The following-named gentlemen were elected directors: Samuel W. Allerton, M. K. Bowen, D. G. Hamilton, Joseph Leiter, George T. Smith, William B. Walker, George H. Wheeler.

The only change made in the directorate was the substitution of the name of George T. Smith for that of D. K. Pearsons, who resigned, but the changes, as compared with the list of directors elected at the annual meeting a year ago, were unusually numerous for this corporation. Only three of the men elected in January, 1897, remain in the present board. These are George H. Wheeler, Samuel W. Allerton and William B. Walker. Several months ago L. Z. Leiter resigned to make way for his son. Then William B. Walker withdrew to make a place for D. G. Hamilton. Later, John C. King and E. M. Phelps were succeeded by M. K. Bowen and William B. Walker, the latter having consented to return to the board. The utmost unanimity prevailed, all the stock represented at the meeting, amounting to 73,804 shares, being voted solidly for the ticket named.

The stockholders at the annual meeting on January 15th did not elect the treasurer and secretary owing to the lateness of the hour. During the week, however, the formality of electing T. C. Penington and E. R. Greene was complied with. Mr. Penington has been treasurer of the company since February, 1872, and Mr. Greene has filled the office of secretary acceptably for several years.

From the reports submitted it appears that the year 1897 was a good one with the company. The receipts from passengers increased $19,110 and the total receipts from all sources increased $7,650, while the operating expenses decreased $68,225, being 60.84 per cent. of gross earnings in 1897, as against 62.52 per cent. in 1896. The amount charged off to depreciation was $131,568 less than in 1896, so that the net profits of the company applicable to dividends showed an increase over 1896 of $207,444, being 13.47 per cent. on the stock, as against 13.42 per cent. earned on the stock in 1896. By virtue of the $1,250,000 increase in the capital stock of the company the amount paid out in dividends increased $150,213. Yet the surplus for the year increased $57,231, as compared with the surplus of 1896, being equal to 1.74 per cent. on the company's stock, as against 1.42 per cent. in 1896. The financial showing of the company, compared with that of 1896, is as follows:

	1897.	1896.	Changes.
Passenger earnings	$4,781 055	$4,761 945	*$19,109
Other sources	35,461	46,921	†11,459
Total income	$4,816,516	$4,808,866	*$7,650
Operating expenses	2,908,982	2,977,208	†68,225
Net earnings	$1,907,534	$1,831,658	*$75,870
Bond interest	$207 877	$207,877	....
Depreciation	50,000	181,568	*$131,568
Earnings on stock	$1,649,655	$1,442,212	*$207,444
Dividends paid	1,444 000	1,289,787	*150,213
Surplus	$209,656	$152,425	*$57,231
Surplus brought forward	534 606	382,180	*152,425
Total surplus carried forward	$744,262	$534,605	*$209,656

Surplus for year	1.74	1 42	*0 32
Capital stock	$12,000,000	$10,750,000	*$1,250,000
Bonds, 4½ per cent	4,619,500	4 619,500	....

*Increase. †Decrease

President Wheeler's report contained some interesting statistics regarding the operation of the system and the present condition of the property:

Revenue Car-miles Run During the Year.

		Per ct.
Cable lines	12,562 610	51 532
Horse lines	198,860	0.816
Electric lines	11,616 530	47 652
All lines	24,378,000	100 00

Showing changes over 1896 as follows:

	Miles.	Miles.
Cables, decrease	1,315 580	
Horse, decrease	427,830	
		1,773 410
Electric, increase		1,598,510
Total decrease in service		174,900

Number of Revenue Passengers Carried.

	Passengers.	Per ct.
By cable lines	41 444 636	43 342
By horse lines	691,051	0 723
By electric lines	53,485,425	55.935
All lines	95,621,112	100 00

Being a net increase over previous year of 382,197 passengers, as follows:

Electric lines, increase		7 556,552
Cable lines, decrease	4,990,775	
Horse lines, decrease	2,183,580	
		7,174,355
Net increase		382,197
Percentage of increase		0.401

The increase was made in February, March, September, October, November and December. January, April, May, June, July and August showed decreases.

Receipts During the Year.

From revenue passengers		$4,781,055.57
From miscellaneous sources		35 461.23
Making total receipts		$4,816,516.80
Cost of operation, including insurance and taxes	$2,908,982.80	
(60 84 per cent. of passenger receipts.)		
(60 [illegible] per cent. of total receipts.)		
Interest on bonds, $4,619,500 4½ per cents.	207,877.50	
Depreciation on cables	50,000.00	
		$3,166,860.30
Leaving net earnings		$1,649 656.50
Paid dividends, 12 per cent. on $12,000,000		1,440,000.00
Balance to surplus		$209,656.50
Percentage of earnings applicable to dividends		13.747
Percentage dividends paid		12.000
Surplus		1.747

Statistics.

Passenger receipts, per day	$13,098.78
Increase over 1896, per day	88 00
Expenses per day	7,969.81
Decrease from 1896, per day	164.64
Net receipts per day	5,128 97
Increase per day	252.64
Net loss on horse lines for the year	13,365.66
Decrease from 1896	5,144.35

Cost of operating per car mile	1897. Cents.	1896. Cents.
Cable lines	10 706	10.540
Horse lines	24.096	25.889
Electric lines	13 051	13 467
All lines	11.932	12.126

Motive Power.

Power house, Forty-ninth street and Oakley avenue, with equipment was completed during 1897, furnishing power sufficient to operate [illegible] cars.

The report explains that during the year 5.5 miles of new single electric track was constructed as follows: Three miles covering a route on Morgan street, from Thirty-ninth street bridge to Thirty-

first street; on Main street, from Thirty-first street to Archer avenue, and on private property connecting Morgan and Main streets, and 2.5 miles on Fifty-first street, from Halsted to Wood streets. The following tracks were changed from horse to electric operation: Twenty-second street, from State street to the river, 1.35 miles, and Sixty-third street, from Kedzie avenue to Central Park avenue, one mile, a total of 2.35 miles. During the year the company paved 58,931 square yards as follows: Asphalt, 3.195.6 square yards; white oak blocks, 814.5 square yards; cedar, 29,599 square yards; granite, 12,221.3 square yards; brick, 5,062.8 square yards. A total of 9,759 cast-weld joints were made, 9.108 of which were new ones and 651 took the place of broken joints.

The company owns 1,812 cars and operates 189.72 miles of track. There are 149.74 miles of electric, 34.75 miles of cable and 5.23 miles of horse-car lines.

Death of Benjamin Butterworth.

After a long illness, Benjamin Butterworth, the United States commissioner of patents, died in Thomasville, Ga., on January 16th. Mr. Butterworth went to Thomasville about three weeks before his death, thinking to recuperate from a severe attack of pneumonia which, complicated with the effects of a kidney disease, had exhausted his vitality and left him unfit for the performance of his official duties. The first seven days of his stay showed marked improvement in his condition, and his friends began to hope that he would soon be himself, but three weeks ago he was suddenly attacked with uræmic convulsions. From that relapse he never recovered. His wife and children were telegraphed for and were with him when he died.

Mr. Butterworth had been long in public life and was a man of great charm of character and manner. "Rare Ben Butterworth" was a favorite appellation of his friends. "The most popular man in Washington," says one of wide experience of life in the capital, while a Chicago patent lawyer who knew him intimately testifies that he "had more personal magnetism than any other man in the United States." He was a good lawyer and an exceptionally gifted orator. Twice he was commissioner of patents—once for a year and a half under President Arthur and again, under President McKinley, for the nine months prior to his death. It was only after considerable hesitation that he consented to accept the office for a second time last April, but as soon as he did so he entered upon the discharge of its duties with zeal and energy. He found much to improve and correct and labored earnestly to better the service.

Benjamin Butterworth was born of Quaker parentage about 60 years ago on a farm near Cincinnati. He was educated in that city, which was his home for many years, and there he studied law and was admitted to the bar. He served in the army during the war, and rose to the rank of captain. Returning to Cincinnati, he resumed the practice of law and soon achieved prominence in Republican politics. His services as an orator were in great demand, especially during political campaigns, and this remained true throughout his whole career. Mr. Butterworth added greatly to his reputation by his service in Congress during the '80's. He served four terms as a representative from his native state and was noted for readiness in debate and valuable service on committees. In his second term he was a member of the committee on appropriations, and he also served on the committee on patents, of which he became chairman. In 1883 Mr. Butterworth was one of the special counsel of the government appointed to prosecute the election cases in South Carolina. In October of the same year President Arthur appointed him commissioner of patents, and he served until March 3, 1885, when he resigned to re-enter Congress.

After leaving Congress Mr. Butterworth practiced patent law in Chicago and Washington until 1892 when he was appointed secretary and solicitor-general of the World's Columbian Exposition company. He was greatly interested in the World's Fair, and assisted in entertaining many of the distinguished visitors to Chicago in 1893. After the exposition Mr. Butterworth removed to Washington and resumed his law practice until the time of his appointment as commissioner of patents by President McKinley, to succeed John S. Seymour.

Mr. Butterworth is survived by his wife and four adult children. The funeral services were held in Washington on Wednesday and were attended by the president, several members of the cabinet and many officers of the government in high position.

International Electrical Gathering in Texas.

Arrangements have just been completed for a joint meeting of the Texas Gas and Electric Light Association, Texas Street Railway association and Mexican Gas, Electric and Street Railway association at Laredo, Texas, on March 9th. An active joint committee has been placed in charge of affairs, and a successful and largely attended convention is anticipated. It is said that the number of representatives of Mexican plants may reach a thousand. Good papers are assured and a large hall for exhibits has been offered.

Bell Telephone Companies Report Good Business.

On January 19th the annual meetings of the two Bell telephone companies of Chicago were held. Both companies reported an increase in net earnings. The general statements are given.

CHICAGO TELEPHONE COMPANY.

Following is the financial statement of the company for the calendar year:

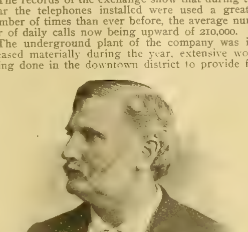
	1896.	1897.
Gross earnings	$1,955,829.03	$2,072,079 55
Expenses	1,355,624 05	1,447,386 08
Net earnings	$ 600,204.98	$ 624,693.47
Dividends paid	499 224.00	520,380 00
Surplus for year	$ 100,980 98	$ 104,313 47
Capital stock outstanding January 1, 1898		$4,336,500 00

At the close of the year 17,689 telephones were operated by the Chicago Telephone company. Of these, 14,105 were in the Chicago telephone exchange, which increased about 1,200 telephones during the year. A large portion of this increase was in telephones placed in private residences, for which a number of new and advantageous rates have been offered.

The plant of the company in the Chicago exchange now comprises 39,961 miles of wire, being an increase of 4,189 miles during the year. Of the above less than 8,800 miles of open wire is now carried on poles, 23,850 miles being contained in underground cables and 7,315 miles in cables attached to poles.

The records of the exchange show that during the year the telephones installed were used a greater number of times than ever before, the average number of daily calls now being upward of 210,000.

The underground plant of the company was increased materially during the year, extensive work being done in the downtown district to provide for



BENJAMIN BUTTERWORTH

the wires leading to two new exchanges which are now being established. The first, to be known as "Central" office, will be opened in the Title and Trust building, 100 Washington street as soon as the necessary switchboards can be obtained. New and enlarged accommodations have been arranged for the "Harrison" office, which, at a later date, will be removed to the Manhattan building, 307 Dearborn street. A new exchange is also to be established this year a short distance west from the river. In these new exchanges the operating apparatus will be of the latest design, by which the subscriber is enabled to control the movements of the operator by means of electric light signals, as in the express system.

About one half of the total number of telephones in Chicago are now of long-distance pattern, operated upon metallic circuits, and the development of the entire exchange is in the direction of giving the very best kind of service to all subscribers.

Directors were re-elected as follows: John M. Clark and Byron L. Smith succeeding the late Henry B. Stone and George M. Pullman, J. Russell Jones, John M. Clark, Norman Williams, Robert T. Lincoln, John de Koven, Byron L. Smith, Arthur G. Fuller, C. E. Perkins, William A. Jackson.

CENTRAL UNION TELEPHONE COMPANY.

President W. A. Jackson's report to the stockholders is as follows:

The following are the comparative figures of the financial transactions of the company for the years 1897 and 1896:

	1897.	1896.
Gross earnings	[illegible]	[illegible]
Expenses: For administration, operating, maintenance and interest	[illegible]	[illegible]
Net revenue	[illegible]	[illegible]
Surplus	[illegible]	[illegible]
Added to construction account		
At exchanges	[illegible]	[illegible]
For toll lines	[illegible]	[illegible]
Total	[illegible]	[illegible]

For the six months from January 1, to June 30, 1896, there was received in gross revenue $67,213.10 from property operated in the state of Iowa, and a net revenue of $26,148.37; therefore, to make the comparison of earnings and expenditures for the years 1897 and 1896 upon an equal basis, the Iowa earnings, as above, should be eliminated, since we have received no revenue from that source in 1897. The actual difference in favor of 1897, upon this basis, is:

Increase of gross earnings	$171,029.62
Increase of net earnings	65,332.10

The number of exchanges in operation this year is 153, an increase of 20; the number of subscribers December 31, 1897, was 36,318, an increase of 4,674; the number of toll-stations is 1,157, an increase of 202; the number of miles of wire in inter-town lines is now 24,446. There has been constructed during the year, in this class of property, 2,298 miles of pole line and 9,352 miles of wire, almost the entire amount of which is of copper metallic circuit. This practically completes the backbone and ribwork of a modern intercommunicating system between cities and towns. On account of the completion of these lines late in the season, the benefits of their increased earning power have not been realized in the year just past.

There yet remains, however, much development to be made in branch lines and spurs, as well as considerable reconstruction of old lines into modern, as strengthening features to the larger centers, the whole leading up to a comprehensive and universal system by means of these intercommunicating lines.

The work of remodeling the Indianapolis exchange is now complete, and it is in all respects the most modern plant of its class in the country, embracing many improvements not heretofore known to the art. In addition to this many improvements have been made at other exchange points, to care and provide for the growth of the business, as well as to add to the facility and completeness of operation. The cost of these improvements is as shown in the financial exhibit. There still remains to be done some important and comprehensive work of this class, in two or three important cities, in the very near future, provisions and plans for which are now being prepared.

The directors of the company are C. H. Brownell, R. C. Clowry, Arthur G. Fuller, F. H. Griggs, John E. Hudson, W. A. Jackson, J. Russell Jones, M. G. Kellogg, Robert T. Lincoln, John F. Wallick and Norman Williams.

Telephone News from the Northwest.

[From the Minneapolis correspondent of the Western Electrician.]

The matter of a local telephone company is being talked of in Lisbon, N. D. The present system is owned by Dr. Bradley of Forman, N. D.

The Eureka Telephone company of Eureka, S. D., has been incorporated with F. W. Boetcher, C. N. Herried, E. G. Kennedy, William Poehler and Joseph Guhin as stockholders.

J. L. Ball of Augusta, Wis., offers to put in an exchange in that city if 50 subscribers can be secured. There is a small system, without a central exchange, now in operation by Mr. Ball.

The Winona Telephone company of Winona, Minn., has increased its switchboard facilities and now can accommodate 600 instruments.

The Ashland, Wis., office of the Wisconsin Telephone company reports an average of between 1,600 and 1,700 calls per day.

J. W. Johnstone, manager of the La Crosse Telephone company of La Crosse, Wis., has resigned. He will be succeeded by George R. Johnston of Chicago.

The new telephone exchange of Sparta, Wis., has begun operations.

P. T. Butler of Butte, Mont., has been placed in charge of the new telephone system in Lewistown, Mont.

A lively war of rates is on at Des Moines, Ia., and cut follows cut. The Mutual Telephone company has recently got its exchange in operation, and the Iowa company at once reduced rates. It now offers party-line service for $12 per year. Where subscribers order out an instrument it is requested to be left for a while to compare the service with that of the new company, without charge. The new company meets this by having its men offer to take down the Iowa company's instruments when putting in theirs, if the subscriber wishes. As a result it has taken down a number of the Iowa company's telephones.

A local telephone company is proposed in Litchfield, Minn.

The Iowa Telephone company offers to put in an exchange at Nevada, Ia.

The Fairmont Telephone company of Fairmont, Minn., had a surplus of $1,124.56 at its annual meeting, held recently.

A stock company is proposed to construct a telephone line between Dell Rapids and Garretson, S. D.

The Northwestern Telephone Exchange company is preparing to extend its lines north from Little Falls, Minn., to Brainerd, Minn.

The Wisconsin Valley Telephone company expects to have 750 miles of telephone line in operation by January 20th. Work was begun on September 27th and has been pushed rapidly ever since. The company connects with all the independent telephone exchanges in Western Wisconsin. It recently published at Eau Claire, Wis., a list of the subscribers of the various independent companies which it connects with in that vicinity.

Bridge Building at Niagara Falls.

By Orrin E. Dunlap.

In recent years electricity and trolley lines have played an important part in the development of the Niagara region. On both sides of the gorge trolley roads run from the Falls down along the river until the principal scenic features are passed, and now it seems probable that connection will be made between these roads, and the means provided for passengers making the trip around the gorge from Niagara Falls to Lewiston, across the river to Queenston, Ont., and up the Canadian side to the Falls on the return. The possibility of this delightful trip is to be effected by the construction of two great bridges to span the chasm. One of these bridges will be a new steel arch to be located on the site of the present upper suspension bridge, while the other will be built across the river between Queenston, Ont., and Lewiston, by the removal of the suspension bridge to that site and there rebuilding it. This will, of course, require considerable outlay, but the necessary capital has been provided, and the work has been commenced.

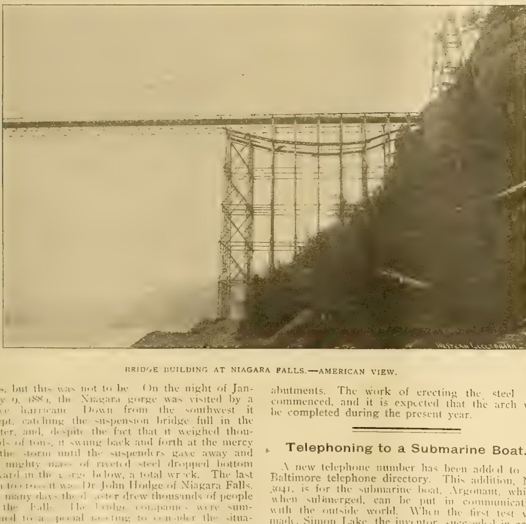
The new steel arch that is to be built will be the greatest bridge of its kind in the world, and is destined to prove an additional attraction to visitors at Niagara. The suspension bridge that is to give way in order that this more modern structure may be erected is one of the famous bridges across the gorge. The first bridge at this point was opened early in 1869. It was an all-wood structure 10 feet wide, which, in 1887-88, was rebuilt in steel, the width being increased to 17½ feet. This latter structure was finished in December, 1888, and the bridge companies felt that they had erected a structure that would outlast the lives of their members, but this was not to be. On the night of January 9, 1889, the Niagara gorge was visited by a fierce hurricane. Down from the southwest it swept, catching the suspension bridge full in the center, and, despite the fact that it weighed thousands of tons, it swung back and forth at the mercy of the storm until the suspenders gave away and the mighty mass of riveted steel dropped bottom upward in the gorge below, a total wreck. The last man to cross it was Dr. John Hodge of Niagara Falls. For many days the disaster drew thousands of people to the Falls. The bridge companies were summoned to a special meeting to consider the situation. They resolved to rebuild. Contracts were let, and in [illegible] days the new suspension bridge was opened to traffic. It is the bridge, only a few years old, that is now to be replaced by the arch. Thus the arch will be the fourth bridge erected on the site.

At the point where the arch is to stand the cliffs are further apart than at any other point between the Falls and Lewiston, the distance between them being 1,268 feet, and it is this space the new bridge is to occupy. The main span of arch in the bridge will be 868 feet long and will be connected to the cliffs by two arms, one of which will be 210 feet long, the other 190 feet. Its rise from the abutments will be about [illegible] feet. The abutments stand close to the water's edge. They are four in number, two on each side of the river, and were built in 1895, it having been expected to build the bridge long before this. In building the abutments care was taken to have them [illegible] and well fitted to withstand the heavy [illegible] that will be placed on them. A solid rock foundation was found, and on this a concrete foundation was built. On the concrete masonry was [illegible] stone used being very large and the mass being given additional strength by eight iron rods in each abutment.

In width the arch will be about [illegible] feet. In the middle of the floor about 23 feet will be devoted to two trolley tracks, and on each side of the tracks will be a roadway for carriages, each about eight feet wide, and outside of these will be walks or footpaths, raised a little above the roadway. The bridge will be a single-deck structure. It was designed by L. L. Buck of New York. Perhaps a better idea of the greatness of this new arch will be gained by comparing its dimensions with those of other great all-metal arches of the world, presented in the following table:

	Span.	Rise.
Louis I., Oporto, Portugal	566	146
Garabit, France	543	170
Grand Trunk, Niagara	550	114
Pia Maria, Portugal	525	121
Eads' St. Louis bridge	520	47
Washington bridge, New York	510	91.7
Paderno, Italy	492	123
Rochester Driving Park	423	67

Naturally the erection of a bridge of the size of the new arch is a feat of no small magnitude, and in order to facilitate the work the suspension bridge will be left in place until the arch is completed. It would be impossible to erect false work to support the entire arch, and so the suspension bridge will be a really important aid in building the arch. On it the great movable derricks will be erected to carry and place the iron where wanted, but traffic on the suspension bridge will not be interrupted by the work. On completion of the arch the suspension bridge will be removed and carried down stream seven miles to the site of reerection, where it will replace the suspension bridge destroyed by wind on April 16, 1864. The false work for the erection of the arch is all in place on both sides of the river between the cliffs and the abutments. The work of erecting the steel has commenced, and it is expected that the arch will be completed during the present year.



BRIDGE BUILDING AT NIAGARA FALLS.—AMERICAN VIEW.

Telephoning to a Submarine Boat.

A new telephone number has been added to the Baltimore telephone directory. This addition, No. 3041, is for the submarine boat, Argonaut, which, when submerged, can be put in communication with the outside world. When the first test was made, Simon Lake, the inventor, succeeded in communicating with people in Baltimore and Washington. The telephone was placed in the office of the Lake Submarine company, whence a wire was run on board the Argonaut. Shortly after noon the boat was submerged, and Mr. Lake, from the bottom of the harbor, proceeded to make himself heard. He first called up the office and received a quick and clear response. He then rang off and called up people at greater distances, finally ending by communicating with the superintendent of the telephone station at Washington. The test was satisfactory in every respect, and marked a new era in the history and usefulness of the Argonaut. The arrangements are as unique as they are complete. The wire, which is on a reel, is encased in water-tight tubes, and can be extended for several miles, if necessary. Mr. Lake is now arranging to make some tests in raising wrecks in the vicinity. He will endeavor to raise the [illegible] Express, which is said to have sunk off the Potomac River some fifteen or eighteen years ago.

W. R. Fahen, the receiver of the Defiance (O.) Light and Railway company, has been ordered by the court to sell, if possible, the street railway property in his charge.

The Relations between the Customer, Consulting Engineer and the Electrical Manufacturer.[1]

By S. Dana Greene.

Part I.

The subject which I have chosen for this paper is an eminently practical one, and I shall endeavor in my remarks to call attention to certain causes of friction which at present exist between the parties in interest, and to suggest certain remedies which may serve to bring about a better understanding and to lessen this friction, which is, in my opinion, entirely unnecessary.

In order to discuss intelligently present conditions, it is advisable to trace briefly the development of the electrical business, and to do this one need hardly go back more than a dozen years. At that time electric lighting was still an experiment (from the commercial standpoint), electric railroading had not begun and electric power transmission was discussed as one of the possibilities of the future. Very few of our institutions of learning had established separate electrical courses, and such a thing as a consulting electrical engineer hardly existed in this country. The few men who had some theoretical knowledge were eagerly caught up by the manufacturing companies, who had difficulty to find men capable of solving the many pressing practical problems with which they were confronted when they began to sell electric machinery. Thus the development of a practical generator and incandescent lamp immediately created a demand for suitable conductors and materials for outside and inside wiring, safety devices, etc., as well as close regulating engines, proper station appliances and many other things which are to-day regarded as "standards" in the business. It was less than a dozen years ago that the first fireproof switchboard was installed in the Broadway Theater. The specifications were drawn by a consulting engineer—a naval officer by the way—calling for a fireproof structure, and the manufacturer no doubt accepted the order thinking that he could use what had always been used before, viz., a wooden framework. In this he was mistaken, however, and after a year's wrangling a slate board was installed, much to the manufacturer's disgust, and at great expense to him. It is hardly necessary to say that this form of switchboard became standard immediately, and several years after, the manufacturer, happening to meet the naval officer, said to him, "Someone was a d——d fool about that switchboard, and you were not the man." I well remember when I left the navy to join the Sprague company in June, 1887, I found that the technical force of the company consisted of Mr. Sprague, an ex-naval officer, and Lieut. Crosby, who had just left the army. Upon explaining to the former how modest was my store of knowledge on the subject of "electric street railways," he at once assured me by saying that we were all in about the same boat, and that there was a fine opportunity to learn! My opportunity came sooner than I expected when, about July 1st, I was charged with the execution of a contract for the equipment of a 40-car road in Richmond, Va., which, under the terms of the contract, was to be in full and complete operation on the first of the following October.

Doubtless most of those present to-night can recall the remarkable growth of electric lighting and railway work, during the next five years, from 1887 to 1892, a growth that can fairly be called tropical. Plants sprang up in nearly every city and town in the country, and manufacturers sprang up with equal rapidity. There seemed to be unlimited money ready to invest in electrical enterprises, and the anticipated profits were such as to make the old established manufacturing industries seem very poor investments. During this period, which may be called the "forced expansion period," purchasers usually had to take what they could get and consulting engineers were few and far between. Specifications for apparatus or installations when there were any, were generally prepared by the manufacturer, and the purchaser rarely knew whether they had been fulfilled or not. By the close of this period, however, the colleges and technical schools began to turn out men who had taken special courses in electricity and who naturally looked for a chance to make an honest living. The first great demand of the manufacturing companies for technical assistants having been satisfied, many of these young men found their way into local operating companies, or else established themselves as consulting or contracting engineers, in which positions they found plenty of work, for by this time the imperfection in the earlier installations and types of apparatus had become plainly evident to the purchaser as well as to the manufacturer, and there was a general demand for better workmanship and more rigid requirements in installation. It may be here noted that much of the "anticipated profit" of the business, both of the operating and manufacturing companies, was spent subsequently in making good these early defects, and while the business as a whole profited largely by this reconstruction process, it naturally dampened the enthusiasm of the early investors.

In 1893 came the panic, and for the past four years there has been a wonderful record of savings

1. Read before the New York Electrical society, January 21 1898.

and economies, both in electrical manufacturing and operating companies, as well as a great improvement in quality of product. It has been, in fact, the "economic and reconstruction period." The operating companies have learned that they, too, are manufacturers of a product, electricity; and as these hard times have forced down the price of their product, they, like the manufacturers of apparatus, have to keep their heads above water and their companies out of receivers' hands by the introduction of more economical and improved methods of manufacture and of administration. During the past year there has been a marked improvement in the electrical business; it is to be hoped that this improvement is permanent, and that the past four years of retrenchment and economy have paved the way for a normal and steady growth on conservative lines—in other words, for a period of "natural expansion." The business to-day is on much the same basis as in other industries, where prices are close, competition keen, and where a better article is furnished for less money than ever before.

The manufacturers of apparatus and the manufacturers of current are dependent upon each other to a large extent, and their relations should be close and friendly. The consulting engineer, as in other engineering trades, is a necessary and proper connecting link between the two, and I can say frankly that I believe he has a proper and permanent field of usefulness. Broadly speaking, his function is to see that his client who buys apparatus and installs it selects first that system best suited to his particular local conditions, and then, in purchasing, secures the best (not necessarily the most) for his money. It is equally the duty of the consulting engineer to learn what the manufacturer can reasonably be

BRIDGE BUILDING AT NIAGARA FALLS CANADIAN VIEW.

called upon to make, to consult with him freely and to obtain the benefit of his experience; to give him credit for work well done, and to insist that bad work shall be promptly corrected. Many consulting engineers, especially those who have recently commenced practice, seem to think that it is improper for them to consult with the manufacturer or to examine his plant, or to ask him for information or advice. Their idea seems to be that, by so doing, they may be accused of partiality or undue bias, or with lack of proper care for the interests of the purchaser; or they may feel that it is derogatory to their own dignity as independent engineers. The inevitable result is that specifications often contain provisions which are a source of annoyance and expense to the manufacturer and purchaser alike, and which have no compensating advantages from either the engineering or commercial standpoint. In fact, some of these provisions are impossible or impracticable of fulfillment, and in such cases the honest manufacturer who wishes to meet the specifications and guarantees required finds himself forced to ask the engineer or the purchaser (sometimes both) to modify them. This is a proceeding which is always difficult and delicate to undertake, and often results in friction and trouble for all concerned. I am satisfied that if every consulting engineer would take advantage of opportunities as they occur, to visit manufacturing establishments, see the work there in progress and confer with the engineers, he would find himself well repaid for the visit, and his own work and practice benefited thereby. I am equally satisfied that no reputable manufacturing establishment would refuse admittance, but on the contrary would welcome such visits as beneficial to both parties. The day of mysterious methods of manufacture, carried on behind closed doors, is passed in the electrical business, and I appeal with confidence for an indorsement of the opinion just expressed, to those consulting engineers who have already tried the plan suggested. I have said that I thought the engineer would find himself repaid by such visits. I think, also, that he will find himself in a better position to advise his client intelligently. A purchaser usually knows little or nothing of the relative technical merits of apparatus, and his final decision is governed largely by price and by paper statements and guarantees, which may mean much or little. The consulting engineer who has seen the apparatus in process of manufacture can advise not only as to whether the various bids comply with the specifications, but also what make or makes of apparatus are, from their design, construction and factory inspection and test, most likely to give the least trouble and expense in continuous service.

Some engineers seem to measure their value to the purchaser by the length of their specifications, and some of these formidable documents strike terror to the heart of a busy man confronted by a desk full of mail. The specifications not only specify what the conditions of service are, what apparatus is required and what tests shall be applied to it for acceptance, all of which are quite proper, but also how it shall be built, which is another matter. The electrical manufacturers of this country, following the admirable precedent which has given American manufactured products (particularly machinery) a world-wide reputation, have endeavored to establish standard lines of apparatus, whenever the permanency of type and the size of the demand warrant it. This practice not only tends to reduce cost (and with it price), but also enables the purchaser to secure quickly and at a minimum of expense duplicate parts which are really duplicates and which can be fitted without the aid of a skilled mechanic. It is the American system of standard lines of machinery and interchangeability of parts, which has stood the test of time and which holds its own against all competitors. This system, however, is possible only where the same article is manufactured in quantity, since the expense of designs, drawings and patterns, special tools, jigs, dies, etc., is prohibitive unless spread over a large production. On the other hand, if special apparatus is required it means a relatively large expense for these items, which cannot be charged to a standard product, and which thus constitutes a handicap both to the manufacturer and the purchaser. A machine is "standardized" only after long experience, both in manufacture and service, and other manufacturers (the builders of engines, trucks, etc.) as well as the users, are invariably consulted before such standardization. It would appear to be to the interest of both seller and buyer to use such standard machines wherever and whenever possible; and yet it seems to be a fact that the demand for special machines is increasing, rather than decreasing, as apparatus becomes more generally standardized. To prove this I can cite the experience for the past year of one manufacturing company, with which I am familiar. During this period, the designing engineers were called upon for estimates on special apparatus as follows:

Direct current:
- Number of estimates 300
- Number of kilowatts of apparatus involved 31,000

Alternating current:
- Number of estimates 300
- Number of kilowatts of apparatus involved 131,200

These estimates were all embodied in formal propositions. Besides these there were between two and three times as many preliminary estimates required to answer inquiries of customers, which the engineers had to prepare.

This was in addition to their regular work on standard lines of apparatus, of which there are over thirty. Some of this work was undoubtedly due to new developments in the business and to new methods and inventions, a condition which, although unfortunate from the manufacturing standpoint, must exist for many years to come; but a great deal of it was also due to the fact that specifications call for special apparatus, or methods of construction, where standard apparatus and methods would do equally well. This experience I find is common among electrical manufacturers, and I attribute it largely to lack of touch between the manufacturer and the engineer drawing the specifications, whether he be regularly employed by the purchaser, or retained in an advisory capacity. Let the engineer see more of the manufacturer and his work and let him hold the latter responsible for results, as determined by proper tests, leaving the details of construction where they belong, in the manufacturer's hands.

Armour Institute of Technology.

William H. Merrill, Jr., electrician for the National Board of Fire Underwriters, delivered a lecture on "Electrical Fire Hazards" to the students of Armour Institute of Technology on January 18th. He divided the fire risks into eight classes, as follows:

I. Crosses between aerial wires of different systems.

II. Grounds and short-circuits on electric light and power systems.

III. Wooden-based devices.

IV. Transformer breakdowns.

V. Sparks from arc lamps.

VI. Poor contacts and connections.

VII. Heating effects of incandescent lamps.

VIII. Miscellaneous troubles from (a) cut-outs, (b) switches, (c) rheostats, (d) motors and dynamos.

He recommended that transmission circuits, and even isolated plants, especially where the conductors pass from one building to another near by, should be put in underground conduits, unless there are good economic reasons for overhead construction. If this practice becomes general, he maintained, fires of electrical origin will be much less numerous than at present, and a great many troubles which are destructive to apparatus will be avoided. He emphasized the danger of loose contacts, joints or connections when placed near inflammable substances, such as wood or fiber insulation.

These remarks were strikingly illustrated by numerous examples which had been collected by the inspectors. The necessity for some adequate earthing device to protect the secondary of the transformer from the primary electromotive force was pointed out, and certain recent pieces of apparatus to accomplish this were described. He believed that the attempt to prevent the primary from short-circuiting with the secondary could not be entirely accomplished by increasing the thickness and character of the insulation. The fire hazard with transformers is very great when high electromotive forces accidentally get in the primary coil. In one instance, lightning burned through to the secondary and punctured the gaspipe in four or five chandeliers just at the insulating joint, and ignited the escaping gas, thus starting four or five simultaneous fires in the house.

Universal Exposition at London, Eng.

Electrical manufacturers in this country may be interested in the announcement that a Universal Exposition will be held from May to October, this year, at Earl's Court, London.

The exposition will be under the director-generalship of Imre Kiralfy, of New York and Chicago fame, and it is intended to illustrate the latest achievements in inventions, manufactures, industries and applied arts.

Important sections will be devoted to the largest manufacturing and producing countries of the world, and, considering that it is over 12 years since an exposition of this kind was held in London, and judging from the ever-increasing development of American trade during this time, it is confidently expected that American producers and manufacturers will avail themselves of this opportunity to extend their business. Mr. Kiralfy says that the best location has been reserved to the United States department, and no pains will be spared by the management in order to afford every facility to American exhibitors.

Mr. A. Macchi, who was a member of the Board of Judges at the World's Columbian Exposition in Chicago and commissioner at the expositions at San Francisco and Atlanta and lately chief of the foreign department at the Tennessee Centennial Exposition, Nashville, 1897, has been appointed commissioner for the United States.

The Chicago City Railway company has asked the City Council for some extensions in Twenty-second and Thirty-fifth streets and in Center avenue. The ordinance covered the following named streets: In Twenty-second street, from Indiana avenue to South Park avenue, and in South Park avenue 200 feet south; in Thirty-fifth street, from Cottage Grove avenue to the Illinois Central tracks; in Center avenue, from Thirty-fifth street to Twenty-second street. The rate of fare is to be five cents, with transfers from all cross-town lines. Any operating power may be used except steam.

Western Electrician

EVERY SATURDAY.

PUBLICATION OFFICES:

Suite 510 Marquette Building, CHICAGO.

TELEPHONE, MAIN 1746.

EASTERN OFFICE: 108 TIMES BUILDING, NEW YORK.

Trade Supplied by Western News Co.

COPYRIGHT.—Not only the title but the *entire contents* of each number of the WESTERN ELECTRICIAN are copyrighted. This paper is entered at the Chicago postoffice as mail matter of the second class.

SUBSCRIPTION, in advance, postage prepaid, $3.00 for a full year of 52 numbers; in clubs of four or more, $2.50, with free extra copy for eight subscriptions; foreign countries, $5.00 a year, single copies, 10 cents. When change of address is requested, the old address as well as the new should be given.

CORRESPONDENCE relating to electricity or any of its practical applications is cordially invited, and the co operation of all electrical thinkers and workers earnestly desired. Clear, concise, well written articles are especially welcome; and communications, views, news items, local newspaper clippings, or any information likely to interest electricians, will be thankfully received and cheerfully acknowledged.

ADVERTISING.—THE WESTERN ELECTRICIAN — **the only general electrical paper published in the West**—thoroughly covers a territory *exclusively its own*. THIS IS A CLAIM WHICH CAN BE MADE BY NO OTHER ELECTRICAL JOURNAL IN THE UNITED STATES. Electrical merchants and manufacturers *desiring western trade* will appreciate the UNEQUALED VALUE of this journal as an advertising medium in its special field. Advertising rates are moderate, and will be furnished on application.

HIGH WATER MARK

CIRCULATION, 20,000.

State of Illinois, County of Cook—ss

Frank Foster Kenworthy being duly sworn deposes and says that he is a resident of the city of Chicago, in the county of Cook and state of Illinois, and that he is the superintendent of the binding department of the Electrician Publishing company, the publishers of the Western Electrician; that he was present at and superintended the binding of No. 24 of Vol. 20 of the Western Electrician, issued on June 12, 1897, and that there were sent out by actual count 20,000 complete copies of said Western Electrician of the volume and number above specified.

And further this affiant sayeth not.

FRANK FOSTER KENWORTHY.

Subscribed and sworn to before me this 27th day of July, 1897.
Chicago, July 27, 1897. IRA B. JONES. Notary Public.

Four Years' Record of Electric Light Convention Advertising.

Illustrated Electrical Patent Record

Considerable space is devoted in this issue to the proceedings of the Milwaukee meeting of the Northwestern Electrical association. The organization continues to attract attention and win the support of the fraternity throughout the Northwest. The list of new members admitted at Milwaukee is an excellent indication of the growing power of this association.

The American Street Railway association is already preparing for the annual meeting of that organization in Boston. There will be a meeting of the executive committee next Tuesday, at which the plans proposed by the local street-railway men will be considered. It is believed that all the preliminary arrangements will be made at that meeting and decision reached upon the principal features of the programme for the coming meeting.

During the last few weeks the publisher of an eastern electrical paper has been circulating among electrical advertisers a fac-simile letter purporting to be addressed to him by an electrical manufacturing company, in which serious reflections are cast upon the merits of the other electrical publications of the country. The letter is false and malicious in every respect, and was inspired by the publisher in whose interest the electrical company appears to act as a tool, judging from the form and contents of the communication. It is unnecessary to mention by name the publisher who is responsible for this dirty work; there is only one who is capable of resorting to such methods.

We also forbear mentioning the name of the company for the present, in the hope that it may furnish some explanation of its action.

An English weekly journal predicts that some day there will be a terrible fire on one of the great Atlantic liners from the unprotected flame of a spirit lamp used to heat curling-irons. Curling one's hair in one's cabin is against the rules of every passenger ship. The rule is an unwritten one, to be sure, but it is understood. Every ship's captain will say that all passengers understand that under no consideration are matches or spirt-lamps to be used in the cabins. The reason of this rule is not hard to find—a preventive of the dangers of a fire at sea. But the ladies—or many of them—feel that they really must curl their hair, and pack spirit-lamps, methylated spirit, curling-tongs and matches in their steamer trunks. It is feared that some day one of these lamps will topple over when the ship gives a lurch and that a disastrous fire may result. The suggested prevention of this calamity is the provision of electric curling-iron heaters in every stateroom of the ship.

Some interesting points about the common use of poles sustaining electric wires were raised and decided in a recent case in Connecticut. It was decided that it is not unlawful for a telephone company and an electric railroad company to use the same poles, when such joint use is with the consent of both companies, and at the request of the municipal authorities, especially where full control of the location of the wires and structures is given to the local authorities by statute. The decision was made by the Supreme Court of Errors of Connecticut, in the case of Bergin against the Southern New England Telephone company and the Meriden Electric Railroad company. Where there is such joint use of poles, the court says, there is no absolute requirement of law imposing upon the telephone company the duty, to its linemen, of inspecting and testing the guy wires or the circuit breakers of the electric railroad company. Whether the employer or the employe should discharge such duty, [illegible] must depend upon the circumstances of each particular case. In many instances, the [illegible] state, either may properly perform that work, and in some cases who should perform that [illegible] question of fact, to be determined by a [illegible] of circumstances, such as the nature of the [illegible] inspection, the skill, opportunity and [illegible] the workmen to properly do it, and the [illegible] the contract of employment.

The evidence in this case showed that when, in the performance of the work in which they [illegible] it became necessary to handle [illegible] of the electric railroad company, or when a contact [illegible] such wire was likely to occur, the duty devolved upon the employes of the telephone company, and not upon that company, to first ascertain whether such wire was charged with electricity. As against the telephone company, therefore, the court holds that a lineman's negligent failure to make needed tests to know the unsafe condition of a guy or span wire of the railroad company using the same poles must defeat a recovery for an injury caused by such failure. But as against the railroad company, not being its employe, the court says that he is under no contract duty to test its wires or circuit breakers, and may, under some circumstances, assume that it is performing its duty, and using suitable and safe appliances to prevent the escape of electricity from the main or trolley wire to the guy wires. Yet the latter will be liable for an injury caused by its negligence only to one who was himself in the exercise of ordinary care.

Alas, we are discovered! Starting to do up our hated trade rivals, we Americans are ourselves undone. We might have known it; the conservatives told us that the scheme could never escape the Argus eyes, the serene intelligence, of the English technical press; but a hot-headed administration knew no pause. It was the golden opportunity—the tide that, taken at the flood (which we were to artfully augment), would lead us on to fortune and overwhelm the purse-proud Briton. And what has been the result? Miserable failure—nothing less. One clear, clarion note has been tooted by the Electrical Review of London, and all the fat is in the fire. "Men of the Amalgamated Society of Engineers," demands our contemporary, with impressive eloquence, "have you positively ascertained that among the agitators who are goading you on to your doom there is not one who is in the pay of Germany or America?" After that, further attempt at concealment would be worse than folly. The question so skillfully pressed home is an accusation, and denial is useless. The jig is up; the scheme has aborted; let us recall our agitators and cry quits. The English can conduct their own strikes in the future.

In spite of hard times, some of the electrical enterprises that find it necessary at this time to seek additional capital make an excellent showing. The Central Union Telephone company of Chicago and the United Traction company of Pittsburg are notable examples. Both invite the attention of investors to their securities, and the figures they present would seem to indicate that the earning capacity of this class of investments has not been seriously affected.

The Central Union statement places the earnings of the last year, after deducting all charges except interest on bonds, at $340,787. This is considered a remarkably good showing in view of the expenditures for extensions and maintenance. After deducting the annual interest charge upon all bonds outstanding, including the new issue, which will now amount to $150,000 a year, a dividend of about 4-5 per cent. might be declared. The earnings of stock in 1896 amounted to 3½ per cent., but interest charges then were less than half the present interest obligations. During the five years ended December 21, 1896, the net earnings of the company amounted to $1,533,923, an average of $306,784 per year, and net earnings for 1897 were, therefore, $34,000 greater than the five years' average. This excellent condition is particularly noteworthy at this time because of the competition which has developed in the Central Union company's terrritory.

The United Traction company of Pittsburg is a consolidation of the principal street railway lines of Pittsburg and Allegheny, and this property, it is claimed, earned in 12 months, during seven of which the roads were operated under separate managements, more than enough to pay the interest on all obligations then outstanding and also full dividends on the preferred stock. For the five months ended November 30, 1897, for which period the United Traction company has been operating the properties, the surplus earned over full dividends on preferred stock for six months was $28,-270.85.

It is really gratifying to note these instances, and it is to be hoped that the new year will mark the beginning of a period of general prosperity throughout the country.

Northwestern Electrical Association.

Favored by excellent weather, the Northwestern Electrical association began its sixth annual meeting at the Hotel Pfister, Milwaukee, on Wednesday, January 19th. The sessions continued during three days, the attendance being the largest in the history of the association. There were several very interesting displays of electrical apparatus in the parlors of the hotel, and several new devices were shown for the first time at this meeting.

The opening session was occupied principally with the reading of the president's address, the report of the secretary and treasurer and the election of new members. It is worthy of mention that the number of applications for membership which were received this year was far in excess of the number received at any previous meeting.

In the afternoon there was an interesting discussion of the law affecting the taxation of electrical corporations in Wisconsin. A good deal of opposition was manifested to the present arrangement, which requires the payment of a certain percentage of the gross receipts of the companies. Many of and members favored a return to the old method by which the assessments were levied by local assessors. The corporations in the large towns, especially the Milwaukee Street Railway and Lighting company, had advocated the enactment of the present law, giving as a reason their reluctance to submit such an important question to the city assessors of Milwaukee. This corporation claimed that the prejudice against it was so strong in Milwaukee that it could not submit its interests to the local board of assessors at that time. Many of the representatives of smaller companies contended that this was a short-sighted policy, as the tendency of the Legislature would be toward increasing the rate of taxation from year to year. It was pointed out that the experience of the water companies of the state warranted this conclusion. No final disposition was made of the matter, however, and one member, in commenting upon the situation, exclaimed: "Thank God, there will be no Legislature this year!" Another subject that occupied a good deal of attention at the same meeting was the discussion of the time and place for holding the midsummer convention. These discussions occupied considerable time, but the convention finally got down to business late on Wednesday afternoon, and Alex Dow of Detoit presented a paper on "Electric Lighting for Profit." There was no general discussion of this paper.

Mr. Dow was invited to open a discussion upon the subject of "Municipal Lighting." He gave a history of the troubles of the city of Detroit, which finally culminated in the establishment of a city lighting plant, and presented considerable data upon the cost of construction, operation and maintenance of this plant. The convention decided not to give out Mr. Dow's address for publication, but it may be stated that while he asserted that he believed the city of Detroit was justified in establishing a municipal plant, and in fact, as he put it, "was forced into doing so by the action of local lighting companies," he was not prepared to advocate municipal ownership generally. On the contrary, his address indicated a sympathy with the idea of central stations furnishing public lighting by contract.

A detailed account of the proceedings, prepared from the official stenographer's report, is appended:

Convention Proceedings.

The sixth annual convention of the Northwestern Electrical association was called to order January 19th, at 11 a. m., by the president, H. C. Higgins of Marinette, Wis., and after the roll had been called by the secretary, and the minutes of the last convention accepted as printed, the president read his address, in which he said:

I am pleased indeed to see so many of you present. It bespeaks a good convention, and as president of this association I thank you for your presence here to-day. I see that the supply man, God bless him, is quite in evidence, for which I am also thankful, for I think him the saving clause of this association. I do not know what we would do without him, and I believe in electing him to full membership.

I am a believer in associations and frequent conventions, the more frequent the better. I trust that you have come to this convention to talk as well as to listen, and give us all the benefit of your experiences in the business. I am glad to be able to state that but one death has occurred in our ranks during the year, and no company which is represented in this association has gone into the hands of a receiver except one, and that only temporarily. There has been no state legislation enacted that I consider particularly offensive to our business, and so far as I can learn, the committees appointed at our last January meeting have done their work well.

I see before me many men who have been in the central-station electric light business for years, some of them having grown gray in it, and I do not know of more than one or two instances where they have realized one dollar on their many years' investment, still the public thinks we have too many privileges and are getting rich through the business. To be sure, those who went into the business in its early days had much to contend with. We have learned something about the business and can now get more efficient help than formerly, and at reduced wages; our supplies are much cheaper, and although we have all reduced our prices for light, I am sure we are all doing better in a financial way than we were in the early history of the business. When we first went into the electric light business we paid $25 a thousand for carbons, a dollar apiece for incandescent lamps, 70 cents for sockets, and all other supplies necessary for the business at correspondingly high prices, so that I think if we are let alone our business will be fairly remunerative for some time to come. The electric wattmeter has been an excellent thing for us, and I hope the time is near at hand when electric current will be sold only by meter.

One dangerous element that we have to look out for is the political schemer who is always working for the dear people; and the gas and electric light companies seem to invite his particular attention. You may ask me for a receipt of treatment of him, but I must answer that I have none other than to meet him with good work and honest facts. Give the public good service and fair prices and courteous treatment and the battle is won.

The gas business will speak for itself, and, like the poor, will always be with us. We who were in the gas business, when the electric light business was first introduced, remember well how fearful we were lest the new light should send us out of business; yet gas interests and securities stand higher in the financial market of the country than was ever known before electrical lighting was introduced, and as yet neither industry has hurt, but rather helped the other.

I wish it to be understood that my remarks on street-railway matters shall apply principally to street railways of the smaller class, in towns of from 10,000 to 15,000 population. The street-railway business has, I think, suffered more within the last two years than any other legitimate business. Not only has the hard times worked against it, but the bicycles have taken a large percentage of the business. The new woman and many of the old ones have hied themselves away from us on their wheels, and both have had plenty of followers. They have quit us cold, but it is to be hoped that they will soon return in a changed temperament, for as repair bills for broken bicycles are met with and the many various disappointments which surround wheeling have become unbearable to them, it is to be hoped that they will return and give up their nickels to the electric car even more willingly than they have ever done before.

It is gratifying, however, to street-car men to know that the expenses of operating, as well as those of original purchase, have been very much reduced. The reduced receipts have had much to do with the reduction in operating expenses, so that perhaps after all the reduced receipts have been a blessing in disguise. I think that no business has ever been launched that has been more disappointing to those putting their time and money into it than has been electric lighting and electric street railroading, especially in their early history. The man who was running a horse-car or a mule-car line would go to a town where they were running the new electric street railway; he would see the beautiful cars with every seat occupied by a passenger, gliding over the track without any apparent effort and at a more rapid rate than he had ever hoped to accomplish on his line, a uniformed conductor on one end, a uniformed motorman on the other, with everything bright and shiny. It was a beautiful sight to him, and frequently he did not go home until he first visited the office of Mr. Beggs or Mr. Sunny, whose bright, smiling countenances were only a continuation of the bright things he had seen in the electrical equipment at the last town which he had visited, and got prices from each of these gentlemen for electrically equipping his road at once. He went home, consulted his board of directors the first day, explained what he had seen and some of the things he had felt, and that night sent a message accepting the proposition of one of the contestants before mentioned; the next day a meeting of the council would be called, his franchise changed from horse to electric, and he could not get his stuff quick enough in his mad desire to be the manager of an electric street railway such as he had just seen. We all thought in those days that about all that was necessary was to secure a favorable franchise and the electric manufacturing companies would do the rest, but I know of nothing that so fittingly applies to the case as the following from one of Moore's poems:

> I saw from the beach when the morning was shining,
> A bark o'er the waters move gracefully on,
> And I saw from that beach when the eve was declining,
> The bark was still there, but the waters were gone.

The nickels which we have expected to have supported our enterprise had, like the waters, gone, and left our bark, the street railway, stranded.

It is not to be wondered that after five or six years of experiments in the business and with improved appliances, more efficient help, etc., we can reduce the operating expenses. We can buy our repair parts for one half what we could in the early history of the business and our equipments for one-third, and all better and more efficient than the first. Every appliance in the business has been an improvement on those that went before, and we have all contributed something toward this result, until the business has now become one of comparative pleasure to that which it was in its early history, when we were trying to operate an electric road on a horse-car track with inexperienced help, who, notwithstanding their incompetency, were high-priced and indifferent, for, if they were not retained by you, they were pretty sure of a job at the next town having a similar business. Our rail bonds were continually breaking, our track continually spreading and letting our cars drop to the ground, and no matter how well it was cared for, the track was a constant annoyance. Our commutators were niggering and our motors short-circuiting, and on our very busy days these things seemed to combine to do their worst to make us miserable. Our days were restless and our nights sleepless, but by patience and persistence we have become masters of the situation, and I think if the writer was alive to-day who wrote "He who makes two blades of grass grow where but one grew before is a benefactor," he would add, "And he who carries two passengers where but one was carried before is also a benefactor." We certainly have done more for the public than we have for ourselves and our associates in the building up of these electric street railways.

And now in my closing remarks in relation to electric street railroading, while congratulating ourselves upon the pleasant side of the business, I would ask how long the restless brain or the genius of the nineteenth century, or even the twentieth century, will let us alone. How long will it be before they will have something better to offer us for transporting passengers than an electric street railway? We are already threatened with the airship and the horseless carriage. What will be accomplished in these lines is mere guesswork. Let us hope, however, that at least we who are in the business to-day will get a much needed rest from any further experiments.

Secretary and Treasurer's Report.

Mr. Mercein read the following report, which was adopted:

In July last, as per my report to the convention of that date, our financial condition was as follows:

Assets.

Uncollected dues and fees	$245.00
July dues	240 00
Cash on hand	137 50
Uncollected advertising accounts	30 00
Office furniture, etc	40 00
Central-station pamphlets on hand, cost	60 00
Badges, cost	6.08
	$758.58

Liabilities.

Central-station pamphlets	$102 00
Balance Lord account	59.50
Sundry accounts	51.94
Credit balance	545.14
	$758.58

Since then I have collected from—

Membership fees	$190 00
Dues	135 00
Advertisements in July report	147 00
Stenographic convention reports	120 00
Central-station pamphlets	13 50
	$605 50

And disbursed for—

Stenographers' account	$139.57
Central-station pamphlets	102 00
Traveling expense	82.10
Printing July report	76.00
Secretary's salary	75.00
P. Norcross' account	57.31
Sundry bills	29 69
Postage account	26.00
Office account and sundries	12.33
Western Passenger association	6 00
	$606.00

Our present financial condition is as follows:

Assets.

January dues now payable	$475 00
Delinquent dues and fees	255 00
Cash on hand	137 00
Central-station pamphlets on hand	16.50
Office furniture, etc.	40.00
Uncollected advertising accounts	21 00
Badges	6 08
	$950.58

Liabilities.

Balance Lord account	$ 51 50
Sundry bills	33 75
Credit balance	865 33
	$950.58

Carrying out the instructions of the July convention, I corresponded with the National Electric Light association concerning a possible joint action of the two associations on a municipal ownership report to the Bureau of Statistics at Washington. The matter is still pending. I am credibly informed that the National association proposes at its meeting in Chicago, next June, as one of its prominent features, a full discussion of municipal ownership, inviting prominent advocates of both sides of the question to make the convention their arena for debate. If this information be correct, the National association has seized an opportunity which the Northwestern had, but did not avail itself of, last spring. In this connection I would call attention to page 5 of my July report. I suggest the advisability of appointing a representative of this association to attend the National Association convention. As to central-station pamphlets, after giving the matter careful consideration, it having been left to my judgment, I decided that under the terms upon which the statistics were asked for and furnished we have not the moral right to advertise them for general sale and distribution. The pamphlets are on hand and for sale to members and contributing plants.

only. Five hundred reports of the July convention were printed and mailed to members and central-station plants in the Northwest. I found it necessary to visit Chicago several times, and secured a satisfactory amount of advertising for the report; also was able to renew my previous arrangements with electrical journals for stenographic reports of this convention's proceedings and papers at $20 per set. On December 23d and January 11th first and second notices respectively of this convention were mailed to all members and the electrical press. I have secured a one and one-third railroad rate conditioned upon 100 certificates of attendance, and a special agent of the Western Passenger association will be on hand to-morrow all day to countersign railroad certificates. I take pleasure in stating that I have on hand the largest number of ante-convention applications for membership in the history of the association. We are under obligations to J. M. Hill of Chicago for his activity in this respect; also to Frank L. Perry of Chicago for his service in transportation matters, and to William L. Church of Milwaukee for his valuable work in connection with hotel and exhibit arrangements.

Applications for Membership.

Following is a list of the individuals, firms and corporations that presented applications for membership and were admitted:

Westinghouse, Church, Kerr & Co., Chicago, Ill.
S. S. Neff, Chicago, Ill.
Bryan-Marsh company, New York.
H. L. Brintnall, Saginaw, Mich.
Fred N. Bossen, Calumet, Mich.
J. S. Porteous, Minneapolis, Minn.
National Switch and Signal company, Chicago.
Western Electric company, Chicago.
Electric Storage Battery company, Philadelphia.
Diamond Electric company, Peoria, Ill.
C. H. Wilmerding, Chicago.
Robert E. Richardson, Chicago, Ill.
Cedar Rapids Electric Light and Power company, Cedar Rapids, Ia.
William Chandler, Sault Ste. Marie, Mich.
W. F. Kingen, Sault Ste. Marie, Mich.
John H. Culvert, Decatur, Ill.
G. E. Yost, Portage, Ill.
E. L. Draffen, Chicago, Ill.
Thomas Duncan, Fort Wayne, Ind.
Kohler Bros., Chicago, Ill.
W. D. Chapman, Akron, O.
C. G. Guild, Fort Wayne, Ind.
M. B. Wheeler & Co., Grand Rapids, Mich.
Electrical Engineering company, Minneapolis.
Rohn & Meyer, Milwaukee.
O. G. Goodrich, Minneapolis, Minn.
F. D. Hack, Chicago.
F. B. Badt, Chicago.
J. S. Loomis, Sheboygan, Mich.
Baraboo Gas and Electric Light company, Baraboo, Wis.
Fred D. Nims, Muskegon, Mich.
Cloos Electrical Engineering company, Milwaukee.
Charles S. Kehler, Milwaukee, Wis.
E. D. Alexander, Chicago, Ill.
O. P. Kissel, Hartford, Wis.
H. O. Channon, Quincy, Ill.
Charles L. Burlingham, Chicago.
J. B. Morrill, Evanston, Ill.
E. G. Cowdery, Milwaukee.
A. S. Smith, Milwaukee.
C. G. Gilman, Milwaukee, Wis.
J. H. Andrews, Reed City, Mich.
I. D. H. Ralph, Owasco, Mich.
J. T. Foster, Racine, Wis.
B. J. Shockley, Decatur, Ill.

Several telegrams were received from absent members and read by the secretary.

Election of Officers.

When the afternoon session was called to order by the president, Mr. Bean moved that the chair appoint a committee of three to nominate officers and directors for the ensuing year. The motion was unanimously carried, and the president appointed as such committee W. W. Bean, H. L. Doherty and [illegible] Norcross. The following ticket was recommended by the committee and unanimously elected:

For president, F. A. Copeland of La Crosse, Wis.
For first vice president, [illegible] of Houghton, Mich.
For second vice president, P. H. Korst of Racine, Wis.
For secretary and treasurer, [illegible] Mercein of Milwaukee.
For directors, [illegible] of Sheboygan, Wis., chairman; George L. [illegible] of Belle Plaine, Iowa; S. B. Livermore of Winona, Minn.

The president appointed Messrs. [illegible], Bean and Davis as a committee to escort Mr. Copeland to the chair.

President Copeland said, on assuming the chair: "I thank you very much. It is an honor to which any member of this association should be proud to [illegible]. I wish to congratulate [illegible] on the time that has been kept [illegible] the acquisition of [illegible]. I have no doubt that if each member does his part we will [illegible] swallow up all the other [illegible]. I think that our association is really doing [illegible] good and [illegible] more benefit to the [illegible] in the light and power business and dealing with the public than some of these higher and more aristocratic institutions. We come next to the people, and I would like to impress upon the minds of all members the importance of inducing those that are engaged in any way in the electric-light business to become members of this association. We should convince those people who are not with us now that even if they are not in danger, there may be a time when they will need some help. It is characteristic of human nature to ignore the future when the present is safe, but when one gets into trouble the cry is 'Why don't you do something for us?' Get in line and get to work right on the start and help each other. As I understand the object of this association, it is not to antagonize the public or anything of that kind. We are in a legitimate business and we must teach those that we are dealing with that we are carrying on a legitimate business and will do the best we can, and that all we ask is a fair remuneration for our capital; we will either have that or we will quit.

"There is a good deal of work for each member of the association. A member should not sit down, keep still and let the rest do the work. Each has a certain duty to perform, and if everyone will do his duty, we will have one of the grandest organizations there is in the country; and it will be of vital interest for all those that are engaged in the same business that we are in, or any other business where they have to deal with the public."

Reports of Committees.

The next regular order of business, the report of the protective committee, was announced, and Pliny Norcross made the following statement:

This committee met at Madison several times during the session of the Legislature of 1897. We found there representatives of the gas interests, water companies and street-railway companies, but the electric-light interests exhibited little strength.

I suppose every central-station manager or superintendent or owner knows that instead of being taxed as we were prior to 1897 we now pay a percentage upon our gross income, not, of course, our net proceeds, but our gross income. There are 83 companies in this state doing electric lighting, street-car work and furnishing power. I think it would be entirely fair to say that there were not five companies in the whole state represented at the Legislature at any time. There were only one or two members of the Legislature interested in electric-light companies, and there was no concerted action at all. We did not know whether the majority of the electric-light owners in the state would be satisfied with a 1½ per cent. or one per cent. tax on gross earnings in preference to the manner in which they had been taxed. We did try to and did succeed in defeating or amending, by our presence at Madison, certain bills that we thought were antagonistic to our interests. Mr. Copeland was there three or four times; Mr. Mullen was there continually during a part of the winter; and I went from Janesville to the Legislature some six or seven times. We found bills presented for the express purpose of hindering and obstructing the electric-light industry of the state. I do not say the bills were drawn with that end in view; but when you see a bill introduced in any Legislature providing that a charter cannot be granted for a longer period than one year it is surprising. Anyone will admit that such a law is detrimental to the lighting interests and that a plant could not be put upon its feet with such a limitation. You could not sell a dollar's worth of stock; you could not invite capital to go into an enterprise of that kind. Other bills were introduced which provided that no charter should be granted unless first advertised in certain papers of the state, and certain other conditions performed, all of which were a hindrance to the electric-light interests. We sought in the best way we could to prevent such legislation, and we succeeded in a large degree in preventing damaging legislation.

See what the gas people did, and that shows what organization will do. Their strength lay in the third house. One of the prominent, strong, well-known members of the third house said to me during the last week or so of the session of the Legislature: "Well, Norcross, I hope you have succeeded as well as we have." I said, "I am afraid we have not; you didn't have any percentage bill." "Well, we didn't want any." I said, "We were not very hungry for it ourselves." He said, "Eighty or 85 per cent. of your companies cannot stay at home and expect to do anything. What you want is concerted action. No bill was passed requiring the gas companies and water powers of this state to pay a tax of a percentage of their gross earnings."

There is one point about the percentage bill which is decidedly disadvantageous under some circumstances. Every central-station plant in the state of Wisconsin was compelled on the first Monday or Tuesday of December last to file a sworn statement of its gross receipts, on which it had to pay 1½ per cent. Oftentimes that may not be as onerous a tax as it would be if the assessment was made by the assessors on a valuation of the property. But if an electric-light plant has been losing money, for instance, through competition with a strong gas company, you would not care to have it known. If your business during the last year has not been prosperous, you do not care to advertise that fact in the newspapers. Although it had that unpleasant feature about it, still the Milwaukee electric-light interests were in favor of the percentage plan, for the reason, as they said, that they dare not trust the assessors of the city to fix their valuation and assess it upon that ground. They preferred to pay, and did pay, a magnificent sum, about $53,000 on gross earnings of $1,800,000, for the electric light and street railway together; but the majority of the companies throughout the state did not favor that bill. They would much prefer to have left the matter of the valuation of their plants for taxation purposes to the assessors of their own towns.

The report of the committee on ways and means was called for, but the committee was not ready and no action was taken.

The committee on programme and entertainment presented the printed programme.

Midsummer Convention.

Several documents were presented by Mr. Pamperin, Mr. Cross and Mr. Hill, bearing upon the question of the midsummer meeting. There was considerable rivalry over the selection of the next meeting place, and it was accordingly determined to refer the whole matter to a committee consisting of Messrs. Norcross, Doherty, Hill, Dee and Korst, which will report to the president on April 1st.

Miscellaneous.

C. E. Van Bergen, F. S. Walker and J. M. Hill of Chicago were transferred to the active list of membership.

A paper was read by Alex Dow of Detroit on the subject of "Electric Lighting for Profit," and at its conclusion a vote of thanks was extended to the author.

The morning session on Thursday was occupied principally by two practical discussions. F. B. Badt of Chicago was introduced at the opening of the meeting. He made an address on "Topics of Interest to Central-station Men." His remarks were followed with close attention by the members, and upon the conclusion of his address a vote of thanks was extended to him by the association. The next feature of the meeting was an address on the "Physical and Chemical Properties of Volatile Oils in Boilers," by W. H. Edgar of Chicago. This developed into a practical talk, in which several of the members participated, asking questions. Special conditions were brought up and explained by Dr. Edgar. The afternoon session was devoted principally to the discussion of municipal ownership. Fred DeLand of Chicago had prepared a paper entitled "Municipal Socialism," which was read. This was really a continuation of the discussion begun by Mr. Dow of Detroit on Wednesday afternoon, and was followed up by Messrs. Bean, Dee, Doherty and Norcross. Another feature of interest of the afternoon meeting was the discussion of the plans for the proposed midsummer convention. Prof. Owens' paper on "Electricity in Municipal Ownership" was read at this meeting.

Social Features.

The committee on entertainment had as usual provided an agreeable programme for the entertainment of the members and visitors during the convention. On Wednesday evening a theater party was the principal feature, and Thursday evening was given up to the banquet. Mr. Mercein had been selected as toastmaster, and the following-named gentlemen responded to the several toasts:

"The Badger State," Governor Scofield.
"The Cream City," City Attorney Van Wyck.
"The Electrical Press," Frank L. Perry.
"The National Electric Light Association," W. Worth Bean.
"La Crosse and Hospitality," F. A. Copeland.
"The Light that Failed," H. L. Doherty.
"The Girls We Left Behind Us," H. G. Underwood.
"Ourselves," W. W. Low.

Mr. Stacey of the Electric Appliance company, Chicago, entertained the members with several songs, which were fully appreciated. Charles E. Brown of the Central Electric company made a very appropriate response. The banquet was one of the most pleasant features of the meeting, and was thoroughly appreciated by all who were present.

The New President.

F. A. Copeland of La Crosse, Wis., who was selected for the presidency for the ensuing year, has been identified with the association from its earliest days. Mr. Copeland has large lighting interests in Wisconsin, particularly in La Crosse, where he is the guiding spirit in the local electric lighting company which operates the Edison plant, the Brush company which furnishes the arc lights for street lighting, and also in the gas company.

Col. Copeland, as he has been known heretofore, is 52 years old, a native of Ypsilanti, Mich., and a veteran of the late war. He removed to Wisconsin in 1860, and in 1861 entered the Northern army, serving four years in the Third Wisconsin Cavalry. At the close of the war he engaged in the lumber business at La Crosse, and in 1871 became associated with Gov. C. C. Washburn. He succeeded to Gov. Washburn's business in 1887, and ever since that time has been largely interested in the lumber

trade at La Crosse. He is now the president and owner of the La Crosse Lumber company.

His electrical experience began in 1887, when he organized a company in La Crosse, of which he was made president, and installed an Edison plant to furnish incandescent lights for that city. The original plans of this company provided for an equipment to furnish 2,500 lights ultimately, although the promoters had no idea that this number of lamps would be required for several years. At the present time, however, the company is furnishing current for 15,000 incandescent lamps.

The Brush Electric Light company of La Crosse, which furnishes arc lamps for commercial use and for city lighting, and the La Crosse Gas Light company, which controls the gas-lighting business of the town, are operated by a syndicate of three, of which Mr. Copeland is a member.

President Copeland belongs to many social and benevolent organizations, but aside from the Northwestern association, in which he is deeply interested, and the Association of Edison Illuminating Companies, he has no connection with any electrical body.

The Chicago Delegation.

The largest representation of Chicago interests at a Northwestern Electrical association meeting that has ever been known in the history of the organization was that of the convention just closed at Milwaukee. On Wednesday morning a party of 60, under the direction of Frank L. Perry, took special cars on the Chicago, Milwaukee and St. Paul railroad. The trip to Milwaukee was unusually pleasant, as Mr. Perry had provided a mandolin orchestra to furnish music during the trip. The members of the party included several well-known electrical men from Michigan and other points in the vicinity of Chicago. The following is a complete list of the delegates and visitors comprising the Chicago party on the Milwaukee special:

J. S. Loomis,	Charles Jirjahn,
G. A. Hurd,	J. M. Worrill,
W. Wadhams,	Bernhard Hartley,
C. T. Gage,	A. C. Shaw,
J. B. Morrill,	T. E. D. Ritchie,
E. K. Batton,	George S. Whyte,
J. B. McKeague,	Robert J. Parvin,
J. B. O'Hara,	B. M. Myers,
H. E. Lang,	A. Louis Kuehmsted,
J. S. Maurer,	I. D. H. Ralph,
B. B. Downs,	J. G. Pomeroy,
A. W. Foster,	A. B. Conover,
H. O. Channon,	W. Worth Bean, Jr.,
W. Worth Bean,	E. H. Abadie,
George Peck,	H. G. Underwood,
W. H. Schott,	B. J. Shockley,
Alex Dow,	W. J. Trott,
F. S. Hunting,	Thomas Duncan,
F. Raymond,	J. E. Randall,
Lucius A. Hine,	R. D. Lucas,
L. M. Cole,	E. H. Hammond,
W. W. Low,	J. M. Hill,
A. C. Garrison,	Ed. R. Grier,
C. G. Guild,	J. M. Knox,
Frank H. Clark,	George S. Searing,
George P. Rex,	J. H. Culver,
George W. Patterson,	C. E. Kammeyer,
F. B. Badt,	E. D. Alexander.
J. H. Harding.	

Exhibits and Exhibitors.

Ever-present H. J. Gille was warmly welcomed by his many old Chicago friends.

John A. Roebling's Sons company of Chicago was represented by A. B. Conover, Jr.

L. W. Kittman, northwestern representative of the Chicago General Fixture company, was everywhere.

A. C. Langstadt of Langstadt & Croswell, supply dealers, Appleton, Wis., mingled with the crowd in Milwaukee.

R. J. Louis, in company with Albert W. Foster, represented the Triumph Electric company of Cincinnati, Ohio.

The Fostoria Incandescent Lamp company's interests were in the hands of B. M. Myers, who represented the company.

W. P. Clawson, electrician of the Goodrich Trasportation company, came up to Milwaukee by boat to mingle with the boys.

Channing T. Gage of the Washburn & Moen Manufacturing company was one of the first to register as a Chicago delegate.

James Wolff, "the immutable," of the New York Insulated Wire company, arrived Thursday afternoon, and was warmly welcomed. All were glad to see him.

Edward J. Patton, western representative of the Perkins Electric Switch Manufacturing company, proved a pleasant companion on a convention trip. Mr. Patton made no exhibit.

The Westinghouse Electric and Manufacturing company was represented by W. H. Whiteside, Henry Floy and W. S. Rugg, and exhibited type 8 alernating-current switchboard, showing the latest type of high-tension air blast switches, fuse block and round pattern instruments, a five horse-power, 200-volt induction motor with starting device, an alternating-current fan motor and a transformer.

Col. F. A. Copeland, who entertained the La Crosse convention so lavishly last summer, was warmly welcomed on his arrival at Milwaukee.

Western Manager C. H. Wilmerding of the Crocker-Wheeler Electric company deputized his energetic representative, Julian Roe, to represent him. Mr. Roe, it is safe to say, did not fail.

Charles S. Kehler, northwestern representative at Milwaukee for the Dearborn Drug and Chemical Works, Chicago, assisted W. H. Edgar in doing the honors. They distributed very neat souvenirs.

Mechanical Engineer G. A. Hurd, with the Crane company, Chicago, was constantly on hand during the sessions and added many leaves to that laurel wreath that he has made for himself as an entertainer.

Moser & Wilson, 39-43 West Washington street, Chicago, were engaged in showing both brass and aluminum castings. This enterprising firm has just closed a contract with J. H. Baker for 3,000 sewing-machine attachments.

John S. Maurer of the Crouse-Tremaine Carbon company and the Fostoria Incandescent Lamp company did good work, especially in advertising the duplex or double lamp that is now being pushed by the Fostoria company.

Hudson Jones of the Milwaukee Board of Underwriters drifted in and greeted his many old friends with whom he became so popular at the Marinette convention. Everyone inquired, too, for MacLaren, who is now in Mexico.

"Where is McGill of the Siemens & Halske company?" was a question that was frequently asked. Mr. McGill made so many friends for himself and his company at the La Crosse convention that his presence was much desired.

The O. C. Little Pulley Coating company of Menasha, Wis., showed a table of sample plates, illustrating the peculiarities of its pulley coating, which can be applied in one hour with a brush and be ready for use in six to ten hours.

George Cutter of Chicago announced that he was developing a fine line of new and ingenious electrical specialties. It has been remarked that there never was a convention at which George did not present a good "something new."

M. B. Austin of the New York Safety and Insulated Wire company and Holmes, Booth & Haydens arrived in Milwaukee with his wife the day before the Chicago delegation. Mr. Austin is well known throughout the Northwest.

Morgan Brooks, president of the Electrical Engineering company of Minneapolis, got in on Thursday. Mr. Brooks looked well, and if he prospers in keeping with his company and grows as rapidly, it would not be safe to predict the end.

John Child, the mica man, appeared also on Thursday, and did the honors for A. O. Schoonmaker. Mr. Child carries a stock of mica on which he has built up a very prosperous business; in fact, the carrying of stock in Chicago is one of its features.

Whyte of the Leschen-Macomber-Whyte company of Chicago, who has just returned from a visit abroad, was warmly welcomed by his host of Northwestern friends. He distributed the little pamphlet by Eugene Field, entitled "The Bottle and the Bird."

Manager Donohoe of the Chicago branch of the American Electrical Works arrived Thursday morning. Mr. Donohoe had not expected to be in attendance, and had dispatched Representative Hammond of the company with the Chicago delegation Wednesday morning.

Secretary and Treasurer William M. Smith of the Chicago Insulated Wire company surprised his friends by appearing for dinner Thursday afternoon. Mr. Smith is one of those popular men much in evidence at every convention, and it would never do for him to be absent.

George Searing, western manager for the Hart & Hegeman Manufacturing company, was on hand, but owing to the illness of his wife was obliged to leave early Thursday. Mr. Searing was missed at the banquet, as he is one of those fine fellows always in demand.

President C. D. Marsh of the Bryan-Marsh company and Joseph M. Hill, the company's western manager, had an interesting exhibit of Imperial incandescent lamps. Mr. Hill was, of course, decidedly in evidence through his aggressive efforts in behalf of his steamboat project for the midsummer convention.

One of the exhibits that attracted much attention was that of the Northern Electrical Manufacturing company of Madison, Wis. The company had several dynamos and motors in operation, one of the machines being a two horse-power motor, which is claimed to be the smallest of its capacity to be found on the American market. The motor, which was shown suspended on the side wall, is for the Wisconsin State University for special use in the lecture room. The other machine was a regular stock motor with patented speed-reducing shaft. The machines manufactured by the Northern company, as is well known, are particularly noted for their high quality of workmanship and perfect balance. They also run cool and sparkless.

Manager Cooke of the western department of the Jandus Electric company, Cleveland, had expected to leave his Chicago office for at least a day, in order to be present, but up to Thursday afternoon he had not put in an appearance and his absence was the cause of many inquiries.

A. Louis Kuehmsted and Francis Raymond were decidedly in evidence as the representatives of the Charles E. Gregory company. Mr. Kuehmsted is treasurer and general manager of the company, and in that capacity has done much to increase an already very prosperous business.

"Everything electrical" was the watchword of President L. W. Burch and Secretary and Treasurer F. L. Stagg of the Electrical Supply company of Madison, Wis. Mr. Stagg has recently joined forces with Mr. Burch, and it is said they are making a great "go" of it throughout the Northwest.

The McDermid Manufacturing company had Manager C. L. Burlingham on hand. Mr. Burlingham at first pleaded that pressure of business would prevent his attendance, but the convention fascinations and other things proved too much for him, and he appeared as an early bird Thursday morning.

Messrs. McKinlock and Camp, representing the successor to the Metropolitan Electric company of Chicago, arrived at the convention Thursday. These gentlemen have recently moved to a handsome new establishment on Randolph street, Chicago, and are making good headway with their new enterprise.

Representative Hammond of the Chicago branch of the American Electrical Works is an energetic salesman and has won universal respect through his good and conservative business methods, and he is rapidly adding to his many friends in western cities in which the American Electrical Works' well-known wires are in such favor.

The Raster Carbon Rheostat company, Chicago, had expected to make an exhibition of its new carbon rheostat, which, it is claimed, will carry overload of 200 per cent. and retain an almost equal resistance whether hot or cold, but found it inconvenient to do so. The office of this company is 414 Ashland block, Chicago.

Western Manager Edward R. Grier of the Bryant Electric company, Monadnock building, Chicago, was among the most energetic of the western representatives present. Mr. Grier has done most excellent work for his company and built up a large business. He was cordially welcomed at his first Northwestern convention.

L. N. Cole of the Duplex Manufacturing Electric company made his first convention trip. Mr. Cole presented the Duplex lamp guard and won many friends. Mr. Cole is starting a business in Chicago as manufacturers' agent, and is in line for select electrical specialties. His office is room 55 Dexter building, 84 Adams street, Chicago

The quick-witted and graceful response of Secretary Charles Brown of the Central Electric company to the sudden call from Toastmaster Mercein, at the banquet, added greatly to his laurels. This was Mr. Brown's first Northwestern convention, and a host of new friends, as well as his many old acquaintances, hope it will not be the last.

Filer & Stowell company, Milwaukee, took a decided interest in the success of the convention. Filer & Stowell manufacture a high-grade electric-light engine that is becoming popular with the electrical fraternity, owing to its close regulation and many other valuable features that make it particularly applicable to electric lighting and other service.

J. Mason Knox of the Varley Duplex Magnet company of New York joined the Chicago contingent and proved to be one of the most jovial of the party. Mr. Knox had with him a line of interesting samples of the Varley magnet windings, containing new features of great value to every purchaser of electrical magnet solenoids, with or without cores.

It was hoped until the last moment that Martin J. Insull of Sargent & Lundy, Chicago general western sales agents for the C. & C. company, could join the Chicago party. Owing to a pressure of business, however, Mr. Insull delegated T. E. D Ritchie. It is perhaps needless to say that Mr. Ritchie acquitted himself with credit to his company and Mr. Insull.

The "Washburn Trio," comprising Charles Jirjahn, manager, and W. Wadhams and J. M. Worrill, dispensed popular music on board the convention train. The way in which the Washburn Trio responded to the demands for more music proved them to be just the thing for such an occasion. The Washburn Trio have their headquarters in Chicago in Steinway Hall.

The Northern Electric Manufacturing company of Madison, Wis., came nobly to the front in the persons of A. O. Fox, secretary and treasurer, assisted by E. G. Richards. Mr. Fox is one of those energetic managers that spends an immense amount of time personally looking into the business and mechanical details appertaining to his company's extensive interests. The Northern Electric com-

pany, under Mr. Fox's management, has done splendid work, and in Milwaukee alone the company has already a number of model motor and dynamo installations. Mr. Fox was warmly welcomed by his many friends.

President James F. Cummings of the Armorite Interior Conduit company of Pittsburg arrived Thursday afternoon. Mr. Cummings, as usual, was the center of a host of warm friends. In fact, as an evidence of his popularity among the electrical fraternity, his room had been handsomely decorated for the occasion in his honor. No convention would be complete without the Conduit King.

Peterman & Wallber, electrical contractors, Milwaukee, were in constant attendance. This firm is just moving to a new store at 49 Oneida street, Milwaukee. Having been in business for three years, the firm has outgrown its present quarters. This firm will carry a most complete stock of electric light and house goods and street-railway supplies.

The electrical press was represented by A. C. Shaw and W. J. McConnell of the Electrical Engineer, W. R. C. Smith of the American Electrician, C. E. Luken of the American Directory, J. V. Church of the Electrical World, Carl E. Kammeyer of the Electrical Review, Fred DeLand of Electrical Engineering, and R. J. Parvin, Frank L. Perry and J. B. O'Hara of the Western Electrician.

The firm of McGill & Pomeroy, manufacturers' agents, Chicago, was represented by both partners. Mr. McGill recently slipped away from his bachelor friends and put himself on record as a man of substantiality. It would have been excusable had he delegated the Milwaukee convention to Pomeroy, but old associations proved too much for him, and once more he and Pomeroy did the honors together.

Western Manager Foster of the Chicago office of the Triumph Electric company was one of the most enthusiastic attendants at the convention, and was one of the first on hand to make up the Chicago party from Union Station. The Triumph company has had remarkable success with its machinery, and great credit is due to the Chicago office for the extensive western business that this concern now enjoys.

Manager W. H. Schott of the Hyde Park Thomson-Houston Light company, Chicago, was on hand at every business and social function during the three days' meeting. Mr. Schott is one of those central-station men whose genial personality makes him a friend at every turn. W. L. Githens, manager of the Hyde Park Electric Light and Power company, did the honors in company with Mr. Schott.

Lucius A. Hine of Lucius A. Hine & Co., electroplaters and enamelers, Chicago, joined the Chicago party and mingled with the delegates at the convention. Mr. Hine's company makes nickel-plating a specialty, and also brass and aluminum foundry specialties, as well as manufacturing builders' hardware and other hardware specialties. Mr. Hine is also in line to purchase old copper wire and worn-out commutator segments.

It had been expected up to the last moment that President Joseph Franklin, Jr., or perhaps Paul D. Cable, manager of sales of the Commercial Electrical Supply company, St. Louis, would join the St. Louis contingent that met the Chicago delegation at Union Station. "Taking stock," however, has many disagreeable features, and this time it resulted in keeping two popular men within the confines of 1007 Market street, St. Louis.

Of course, popular President Willard W. Low was on hand at every stage of the proceedings. Mr. Low came up from Chicago with the party on the St. Paul train, and he was accompanied by Messrs. Downs and Stacey. Mr. Low was really entitled to be on the entertainment committee, from the fact that he was slated to respond to the toast "Ourselves," and had in addition brought with him Mr. Stacey, the possessor, it is said, of the finest baritone voice in Englewood.

Manager Frank H. Clark of the western branch of the Electric Storage Battery company of Philadelphia made his first appearance at a Northwestern convention to tell all hands what he knew of his company's rapid strides during the last six months in the introduction of chloride accumulators. Mr. Clark is an old electrical man of considerable experience, having devoted many years to electrical work throughout the East. He made a very favorable impression.

Alex Dow's paper on "Electric Lighting for Profit" was pronounced by a central station man to be one of the most interesting, practical and useful papers that he had ever read. Francis B. Badt made a splendid address on "Topics of Interest to Central Station Men." John E. Randall, superintendent of the Columbia Incandescent Lamp company of St. Louis, accompanied Secretary and Treasurer Garrison, and read a paper on the "Present Efficiency of Incandescent Lamps."

W. H. Edgar, the president of the Dearborn Drug and Chemical company of Chicago, found time to present a most interesting and valuable treatise on his particular hobby, "Physical and Chemical Properties of Volatile Oils in Boilers." Mr. Edgar is a boiler doctor and no mistake, and he has the natural aversion of the cult to patent nostrums. The Dearborn Chemical company's great forte lies in the fact that it analyzes feed-waters for boilers and makes boiler compounds to suit them, guaranteeing the result.

A very interesting exhibit was given by the People's Electric company of Madison, Wis., in charge of F. H. Ford and C. W. Bacon. Among the numerous specialties displayed were Northern motors and dynamos in operation, the Ritter soldering iron, which is always hot and solders perfectly, Fagan cut-outs, O K batteries, Enamelac, a perfect insulating paint, Peerless armature compound, Rogers' commutator lubricant, Perfection dynamo brushes and general electrical supplies.

The Western Electric company of Chicago was represented by four of its energetic men. Manager A. L. Tucker of the supply department was early on hand, and he was joined during the convention by A. M. Little, N. W. Mixer and Thomas G. Grier, the company's advertising expert. Mr. Tucker distributed a neat announcement, of novel form, that read as follows: "We desire to inform the trade that we are now headquarters for all sizes of Okonite wires and cables, as well as Okonite and Manson tape. Please remember that this material can always be obtained from us at lowest market prices."

George W. Patterson, western representative for the American circular loom, Medbery railway material, Gordon-Burnham and Law primary batteries, as well as the Ohio storage battery, made a host of friends for himself. Mr. Patterson distributed on the convention train from Chicago carnations for the buttonhole, and during the convention presented American Beauties to the ladies in attendance. Mr. Patterson secured a large order for Gordon-Burnham batteries from the Milwaukee police department, and also appointed Julius Andrae agent for his batteries in Milwaukee.

City Passenger Agent Howard E. Laing, of the Chicago, Milwaukee & St. Paul railway, was early on hand at Union Station, Chicago, extending his services and that of other railroad men for the convenience of the crowd of delegates that took the special car over the St. Paul road for the Milwaukee convention. Incidentally it may be said that the St. Paul Railway company, General Passenger Agent Miller and the Milwaukee passenger agent, Martin Cramer, deserve credit for making the transportation arrangements thoroughly satisfactory to everyone. It is said that the party that left Chicago for Milwaukee over the St. Paul was the largest ever sent to the Northwestern convention from Chicago.

The American Rheostat company's exhibit consisted of one one-half horse power, 110-volt automatic starter, one five horse power, 110-volt automatic starter, one 7½ horse power, 110-volt automatic starter, and the front of a 100 horse power 110-volt automatic starter, one five horse power, 220-volt automatic speed controller, one 40-kilowatt, 110-volt rear-of-switchboard field rheostat, one three-kilowatt, 115-volt wall type field rheostat, one three-kilowatt, 115-volt wall type field rheostat, one 10 horse power, 220-volt reversible elevator controller, one five horse power, 220-volt perfection starter, one front for a 20 horse power 220-volt perfection starter, and one controller for sewing-machine work. The exhibit was in charge of Secretary and Treasurer J. Gilbert Hickcox and President Frank R. Bacon.

Charles E. Brown, secretary of the Central Electric company, got in Wednesday afternoon in time to join the theater party. Mr. Brown did the honors for his enterprising company, assisted by W. P. Upham, the company's northwestern representative. Mr. Upham, before Mr. Brown's arrival, had created much amusement and done no little skillful advertising for his company through his exhibition of the latest type of Edison phonograph. The company is now handling these goods most extensively and selling phonographs in large numbers. The outfit exhibited by Mr. Upham was of that practical type that eminently suits it for office service. It was regretted that President McKinlock could not have made the Central Electric party complete by his presence.

No Northwestern convention is considered absolutely complete without Manager of Sales E. H. Abadie, with his usual extensive and novel exhibition of the many high-grade electrical specialties of the Wagner Electric Manufacturing company at St. Louis. Mr. Abadie secured current from the local company's alternating circuit for the purpose of running in his parlor a 15 horse power alternating motor, belted to a 15 horse power direct-current generator, 110 volts. He exhibited his company's new type F transformers, also the new Wagner automatic line cut out, type XX and XL, and a new type of Wagner station instrument. Mr. Abadie made his exhibit complete and its impression lasting by the distribution of a novel Wagner calendar that represented in one picture the apparatus manufactured by the Wagner Electric Manufacturing company of St. Louis.

The Milwaukee convention was the first opportunity afforded Meysenburg & Badt of Chicago to introduce themselves in their new capacity of contracting and consulting engineers to the electrical fraternity of the Northwest. Both members of the company have long been known by reputation to the members of the Northwestern association, and Mr. Badt appeared in person at the convention in order to become better acquainted with the representatives of the companies interested. Meysenburg & Badt occupied a parlor near the convention hall, where they distributed literature descriptive of the apparatus for which they are manufacturers' agents. The following concerns and specialties were in the list: The Weston Electrical Instrument company, Hugo Reisinger, the Ward Leonard Electric company, the Helios Electric company, the Excelsior Electric company, the K. & W. company, Edison-Brown plastic rail bond, Badt hermetic cell. Mr. Badt was assisted by R. F. Schuchardt of Chicago and William Goltz of Milwaukee.

James C. Wormley had an exhibit of Wormley and Shelby lamps in Parlor 5, including all sizes from two to 250 volts, and one-fifth to 50 candle power. There were 75 regular lamps and about 100 miniature lamps, no two alike. Also an exhibit of filament in different stages of manufacture, showing square-cut carbons, manufactured exclusively in the United States by Prof. A. A. Chaillet of the Shelby Electric company, and squirted celluose carbons, made by Joseph Hardwick, superintendent of the same company. The different stages of filaments shown were liquid form, thread, before and after drying, carbonized and treated. The finished lamps were shown burning on a show frame made expressly for the convention. It attracted a great deal of attention.

The Cloos Electrical Engineering company of 342 Broadway, Milwaukee, made a fine exhibit of its safety and economical devices for high-potential currents. The general manager, H. R. King, and the electrical engineer, Mr. Cloos, successfully demonstrated the main features of their devices. "No arc—no spark—no danger." The company presented a highly interesting pamphlet, in which it showed outline representations of seven important devices for economy and safety, namely: Primary or dynamo switch, single and double coupling boxes, alternating and direct junction boxes, single branch cut-out, house or lamp switch or arc service single loop cut-out. Attached to each was a short explanation of its method of operation under the several circumstances in which it will be placed, together with its advantages.

Secretary and Treasurer A. C. Garrison of the Columbia Incandescent Lamp company, in company with Superintendent Randall and George P. Rex, manager of the Chicago office, did noble work for the Columbia lamp. Mr. Garrison presented a full line of samples of all the regular types of Columbia lamps and fancy lamps, including colored "Columbias;" he also showed a line of 220-volt lamps. A feature of his exhibit was the line of materials from which lamps are made, showing the filament in its first stage, the threads, carbonized filaments, etc. A portion of the exhibit that was guarded most zealously was a few of the original Gobel lamps, which proved a few years ago so strong a weapon of defense, as well as offense, in the hands of President Rhotehamel of the Columbia company in the sensational lamp suits of that period.

The General Electric company was represented by F. N. Boyer, J. Scribner and R. A. Swain from the Chicago office, and Thomas Ferris of the Milwaukee end. The exhibit comprised the latest types of apparatus and instruments—direct-current magnetic blow-out lightning arrester, designed for use on circuits carrying 850 volts, to take care of a lightning discharge of 8,000 to 10,000; a new series arc cut-out and ceiling board, the cut-out mounted on a porcelain base enclosed in an iron box which makes it perfectly weatherproof; arc lamps of the carbon feed type and enclosed long-burning direct current lamp, having a life of 125 hours, also the new long-burning alternating enclosed lamp with a life of about 30 hours. Other devices were the Wirt lightning arrester that caused so much comment for its efficiency at the Niagara power plant and the General Electric company's enclosed lightning arresters. Among the measuring instruments displayed were the new lamp inspector's indicating wattmeters. This instrument is designed to accurately and rapidly determine the watts per candle consumed by incandescent lamps. This instrument has been further developed and introduced as a portable indicating wattmeter, which meets the demand for instruments of this class. On account of the rapidity with which readings may be made these wattmeters will be invaluable for testing lamps in barrel lots. Another feature of the exhibit was the electrostatic ground detector. This instrument takes the place of the old type of ground detector for alternating currents, which comprised a transformer and lamp. The old type of ground detector is very unsatisfactory; on account of the capacity of the line the lamp will always glow, leaving the observer in doubt as to the actual condition of the line. The electrostatic ground detector is similar to the electrostatic voltmeter used in electrical laboratories, and is constructed for voltages ranging from one to 10,000. Volt and ampere meters for station, portable, testing and pocket uses were shown. Another novelty was a pocket case containing a complete set of repairing and adjusting tools for the Thomson recording wattmeter. The new direct-current stationary motor was connected and proved unique and interesting. This motor is designed to meet the increasing demand for small sizes of motors, and is constructed for any voltages ranging from one-eighth to one horse power capacity. This motor has been designed to produce the highest efficiency, due re

gard being made to construction as to weight and compactness where space is limited and rigid support unobtainable. By the adoption of magnetic circuit of laminated iron, the weight has been materially reduced. The ventilation has received special attention with marked degree of success. Heating tests show that with 50 per cent. overload for one hour no sparking is noticeable, and rise of temperature is almost imperceptible. A momentary overload of 100 per cent. is possible with little sparking. The motor can be placed in any position, either on the wall, floor or ceiling, and runs noiselessly with the highest degree of economy. The rheostat with which the motor is controlled is of the automatic overload attachment type, which breaks the circuit and prevents the burning out of the armature.

The Fort Wayne Electric corporation had an exhibit of enclosed arc lamps and meters in operation, 110 and 220-volt direct-current lamps and high and low-frequency alternating-current lamps. These lamps are all designed to burn singly on their respective circuits, thus avoiding running lamps in pairs. For 220-volt direct-current circuits this is a great convenience in operation. The alternating-current lamps are built for any frequency and are designed to operate from the ordinary transformer, using a choke coil in place of the resistance in the direct-current lamps, or to operate from the well-known special arc lamp transformer direct from the primary mains and without any choke coil or resistance of any kind, thus effecting quite a saving in cost of operation. These lamps are ornamental in design and are furnished in several different finishes, such as old iron, oxidized copper, etc. Several Duncan induction wattmeters were exhibited in operation. These new wattmeters are meeting with much favor from central-station men. Some of the most valuable features of these meters are their accuracy on wide ranges of load and voltage. Especially is this true of very large-sized meters, which are guaranteed even up to a 1,000-light size to start on one 16 candle power lamp. Another ingenious feature of this meter is the adjustable friction compensating device, which is used to accurately balance the friction of the meter, and allowing it to start on a very small current. This is also used to balance the friction at any voltage the meter may be operating on, or in overcoming the tendency of the meter to creep, if installed where there is considerable vibration. The Fort Wayne Electric corporation was represented by E. L. Draffen of Chicago, Thomas Duncan and F. S. Hunting of Fort Wayne. C. G. Guild, manager of the Jenney Electric Light and Power company of Fort Wayne, was also in attendance at the convention with the Fort Wayne delegation.

The cylinders of the 450 horse power engine used in the Kearny Electric Light and Power company's plant on the Passaic River road at West Arlington, N. J., blew out recently, wrecking the engine and almost demolishing one end of the building. All the lights in the township were put out by the accident. G. F. Woolston, the manager of the company, said that the accident was caused by malicious interference with the crosshead of the engine. He says that the engine was only put in place about three weeks before, and at the inspection which took place afterward was in perfect condition. He alleges that after the accident several bolts in the crosshead were found in such a position as to show that the engine had been tampered with. He suspects a former employe, now working for a rival company.

Jandus Enclosed Arc Lamp.

One of the most striking features of the electrical advancement of the year 1897 was the really remarkable increase in the use of enclosed arc lamps. In this development the Jandus Electric company of Cleveland has taken a leading part with a lamp that has been before the public of this country and Europe for three years. The Jandus lamp burns directly across the terminals of a potential circuit without waste of energy. This makes it desirable for a street-lighting system where multiple circuits are used, and for an underground system it is particularly adapted, because lamps can be connected wherever necessary without the inconvenience of running connecting wires between pairs of lamps or installing two lamps where only one is needed, or wasting the energy of one lamp, as was necessary under the old system of connecting two lamps in series. For interior lighting the economy and convenience of burning lamps singly cannot be overestimated. The Jandus lamp has been highly indorsed by the Board of Fire Underwriters generally. Mechanically and electrically it differs greatly from any other lamp.

The action of the lamp is extremely simple, as shown by Figs. 1 and 2. There is only a single winding which forms the solenoid, shown in section at A (Fig. 1). The armature B is held suspended in a strong magnetic field formed by the iron frame C of the lamp, which surrounds the winding. The regulation of the lamp is maintained by the weight of the armature, which is considerable, opposing the pull of the magnet. When the arc becomes too long from the consumption of the carbon the magnet will weaken, owing to the decrease in the current flowing through it caused by the increased resistance of the arc, and the armature will fall a little until the arc has regained its normal strength and the current consequently restored, when the magnet will again hold the armature stationary. The armature is the plunger for its own dash-pot, formed in a brass tube inside the coil. The carbon D, extended by a tube or sheath E, is inserted directly into the clutch, consisting of a pan-shaped piece F, carrying four clutch rings G, which fall by gravity and grip the carbon between the inclined side of the pan and the carbon. The clutch releases this and allows the carbon to feed when the armature has descended, until the clutch rings rest upon the releasing tube H. This form of clutch allows the unequal sizes of the carbons and sheath to be fed through it with equal accuracy. The current is conducted to the carbon through a series of 16 contact rin , I, which are arranged in a circle and make a flexible contact with the carbon. One of the great advantages of the absence of the carbon rod is that the current is conducted from the mechanism directly to the carbon. The upper carbon is held concentric with the lower by the globe cap, which is centered by the guides on the bottom of the box inclosing the contact rings. The armature carrying the clutch is therefore the only movable part in the entire mechanism of the lamp, the absence of springs or adjustments being one of the most notable features. The yoke J supports the inner globe and the lower carbon holder at its bottom end, where a ring admits the arms of the spider carried on the lower holder. This spider, by a turn to the right, locks the holder in position and closes the electrical circuit through the lamps. The outer globe is secured to the yoke at J by a circular nut, and is closed air-tight at this point by means of asbestos gaskets.

Fig. 1.

Fig. 2.

Fig. 3.

Fig. 4.

JANDUS ENCLOSED ARC LAMP.

Fig. 3 illustrates the Jandus standard lamp for outdoor service. This lamp is provided with a waterproof case, and the terminal wires are led through water-tight rubber bushings, no hood being required. The rheostat is placed below the lower carbon holder inside the outer globe in a position where it will cast no shadow, and is thoroughly protected from the weather and readily accessible. This lamp is furnished in any style or color of finish desired. The lamp for inside service is shown in Fig. 4. The rheostat is placed in a canopy at the top of the lamp, where it can be readily adjusted by dropping the top half of the canopy. A cut-off switch is provided in the canopy. These lamps also are furnished in any desired style or color.

The Jandus lamp embodies the following advantages: Long life (the lamps burning 150 hours on a single half-inch carbon); lamps burn singly with economy on 110-volt circuit; perfect diffusion and uniform distribution of light; absence of flickering; practically noiseless in operation; fewness of working parts; decrease in cost of repairs, and small size.

CORRESPONDENCE.

New York Notes.

New York, January 18.—These are the days of great electrical projects in this city. The Metropolitan Street Railway company is constructing a great electrical system for its surface roads—a plant which, until a couple of weeks ago, was confidently reckoned as the largest electric railway installation in the world. But it is now announced, seemingly on the best of authority, that the Manhattan Elevated Railroad company will at once proceed to equip its lines for electrical operation, and this plant will probably have an aggregate capacity of 75,000 horse power, thus equaling and probably outstripping the plant for the surface lines. Of course, the generating plant may be placed in several power houses, and the figure refers to the ultimate capacity when all the lines in contemplation are fitted for electrical operation.

In the meantime the tunnel scheme of the Rapid Transit commission is laid on the shelf, after years of laborious preparation and litigation. When the Appellate Court required that the contractor for the proposed road should furnish a bond of $15,000,000, the commissioners had only one hope—that the Metropolitan company would come forward to build the road they had planned. This last hope was dashed to the ground on last Wednesday, when President Vreeland of the Metropolitan company sent a letter to the Rapid Transit commissioners stating that his company did not feel justified in embarking in the construction of an underground road. "We entered upon the consideration of the subject," says Mr. Vreeland, "with the belief that the necessity for improved communication between the upper and lower parts of the city was so great that relief must certainly be afforded, and we were sanguine in the expectation that an examination of the subject would show that the Metropolitan Street Railway company could render this public service, and at the same time, in connection with its surface roads, could render greater facility to the public and secure greater profits for itself than anyone else possibly could do. Soon after the public announcement was made of our intention, the elevated railroad companies appear to have expressed their willingness to enter into an arrangement for the extension and improvement of their roads, which the previous city administration endeavored, without success, to obtain from them in preference to the construction of an underground road. This movement on the part of the elevated railroads has been received with approval by the present local authorities. We have no disposition to do anything to obstruct nor to discredit the sincerity and the success of this undertaking, and we therefore do not feel that, so long as the alternative method of securing the desired result appears about to be undertaken, we would be justified in asking our stockholders to engage in the construction of an underground road." This letter and the circumstances generally show that the rapid-transit problem in the city of New York has been a great game, with the Manhattan and Metropolitan companies and the city political leaders as the players. The exact relations of the gamesters are known to only a very few persons; but one thing seems certain—the underground plan has been defeated, for years at least.

A special meeting of the Rapid Transit commission was held yesterday, and the report of the contract committee was received. The committee reports that the exaction of a $15,000,000 bond practically prohibits the whole scheme. It suggests that the court be asked to modify its decision. It recommends in effect that the board rest on its oars and watch closely the proposed improvements and extensions of the Manhattan company. The commissioners adopted the report and also these resolutions:

"Resolved, That the president be requested to invite from the Manhattan Railway company the early presentation of any application for additional facilities or extensions which that company may now desire, and to state in such invitation that this board is ready to go as far, upon assurances of prompt action on the part of the company, and of its willingness to make due compensation to the city, as the interests of the city will permit, toward enabling the company to take such steps as will relieve the needs of the city.

"Resolved, That the counsel of the board be instructed to present a petition to the Appellate Division of the Supreme Court, asking for some modi

fication of the recent decision relative to the bond to be required under section 34 of the Rapid Transit Act; such petition to be in harmony with the views expressed in the said report of the committee, and to be verified by the president and authenticated by the seal of this board."

As to the Manhattan company, there seems to be no doubt as to the fact of the electrical equipment, and it is reported that the Walker company will get the contract. This statement was attributed to Treasurer Ferguson of the Walker company on Saturday: "S. H. Short, general manager of the company, is in New York city, where he expects to close a contract within two days for the electrical equipment of the Manhattan elevated railroad. The contract will call for machinery, etc., to a total value of between $7,000,000 and $8,000,000, to be delivered at the earliest date possible. If the contract is secured our works will be operated night and day. The contract is as good as closed, as all details have been agreed upon." Such a contract would undoubtedly be the largest contract for electrical equipment ever closed in this country, but, so far as I have been able to ascertain, no papers have yet been signed. Details of the plant are, of course, largely conjecture. The Sun gives General Manager Fransioli as authority for the statement that the electrical plant which will replace the present steam motors will have to be capable of developing 75,000 horse power. This calculation is based upon the fact that during the busiest hours of the day about 300 of the total of 330 steam motors are now in use, and each motor is required to exert its total of 250 horse power. A large use of storage batteries is suggested. Four power houses of 20,000 horse power capacity each may be built, or possibly one great generating plant might be constructed on the water front, with alternating-current transmission and rotary converters in sub-stations—all is guesswork. The Sprague multiple-unit system is naturally mentioned, but what the prospect is for its adoption is not known.

Russell Sage is said not to be the authority on Manhattan Elevated that he was, but nevertheless the following statement, reported to have been made by him, is of interest: "The matter has been in the hands of the president and the engineers of the company. The company has prepared its own specifications, and the electrical equipment companies will submit bids under these. The work will, of course, go to the lowest responsible bidders. It is quite probable that it will be divided among several companies. A third rail will be used to carry the current, and it is proposed to have a motor on each car, so that the cars may be run separately, or in trains, as desired. It is the intention to apply electricity on one line first, either the Second Avenue line or the Ninth Avenue line. I am in favor of applying it at the outset on the Ninth Avenue line, so that there may be a demonstration of the effectiveness of the use of electricity the entire distance from the Battery to Harlem. Not so much time as a year will be required. The equipment of the lines with electricity is to be followed by extensions of the lines themselves. It is intended to place elevators at all the stations, and, in brief, to make the elevated lines a perfect system in all respects. The directors of the Manhattan company are a unit on this subject. The cost of the change from steam to electricity on the elevated roads will be large, but once it is made there will be an important saving in operating expenses. The elevated roads carry 700,000 passengers a day without injury to a single person. One reason why electricity has not been adopted before was the determination that in any change in motive power the element of safety should be maintained. It is not true that the Manhattan company is to join with surface railroad companies in establishing power plants. It will have its own independent plant from beginning to end, and its roads will be operated, as in the past, independently of other roads. The elevated roads constitute the ideal transportation system for New York. The people have not wanted an underground system, and it is fortunate for them that they are not to be saddled with the expense of it."

Electrical demonstrations in court are becoming quite frequent, as the volume of commercial electrical litigation increases, and judges, jurymen and attendants are always interested in the experiments. A few days ago the Nassau Electric Railroad company of Brooklyn was the defendant in a suit for damages brought by Mrs. Olga Carlson, who claimed that she had her right hip fractured [illegible] from an open car. She said that the fuse of the motor burned out, that there [illegible], and that a flame flashed up which frightened [illegible] that she jumped from the car. [illegible] the company [illegible] from [illegible] to the Supreme Court room in Brooklyn and [illegible] there with a motor box. A fuse [illegible] other appliances used on trolley cars were [illegible] for the purpose of demonstrating that no flame such as the plaintiff described could have flashed up. A practical illustration was [illegible] the jury. The fuse burned out [illegible]. Justice Keogh [illegible] experiment.

There is talk of [illegible] of all the Brooklyn surface and elevated railway companies, but the rumor seems to be an [illegible]. The [illegible] asserts that all the [illegible] financial [illegible] are in shape for reorganizing the Brooklyn [illegible]

vated Railroad company, and that a contract will be signed with the General Electric company to equip the road electrically for traction purposes. Although the work of equipping the Brooklyn Elevated will not approach in magnitude the making of a plant for the Manhattan Elevated, it will be a very large job. President Uhlman said, at the time he announced the intention of the company to use the new system, that it would mean an expenditure of nearly $3,000,000 to make all the changes which are in contemplation. The Brooklyn elevated road has 20 miles of double track, and it uses 95 steam locomotives, 286 passenger coaches and 14 working cars. The change of motive power at this time was largely the outcome of the plan to bring the trains of the elevated road across the bridge.

As a result of negotiations that have been practically completed the Third Avenue Railroad company is to add to its system the important network of trolley lines in the borough of the Bronx, owned by the Union Railway company. The latter company is commonly called the "Huckleberry," a reference to the fact that its lines extend through a large section of thinly peopled territory. The sale will be closed within the next 10 or 12 days, it is said. The acquirement of the Huckleberry lines by the Third Avenue company will give to the latter about 37 miles of owned and leased tracks in the old annexed district and beyond, with the right to build 54 miles more. It is claimed that the Metropolitan and Third Avenue companies are now in complete accord. M. S.

PERSONAL

Irving Hale, who has been appointed brigadier-general of the Colorado militia, is well known to officers in the army as the man who went through West Point with the highest standing ever attained. He resigned several years ago, after five years' service in the engineers, and has since been in charge of the Denver office of the General Electric company.

William J. Martin, manager of the San Francisco office of the Western Union Telegraph company, has resigned, after 25 years of service, to go into other business. Mr. Martin is an accomplished telegraph manager, and, in conjunction with Superintendent Jaynes, has carried through successfully some remarkable work. One of his notable achievements was the handling on time of the mass of special and press dispatches sent out from Carson, Nev., on the day of the Fitzsimmons-Corbett prize-fight.

G. Herbert Condict, the chief engineer of the Electric Vehicle company of New York, was in Chicago on Monday and Tuesday to transact some business connected with the winding up of the affairs of the Englewood and Chicago Electric Street Railway company. Mr. Condict is confident that the electric carriage has a very promising future, and he thinks that with good city streets there is no reason why heavier vehicles, such as general delivery wagons and even trucks and drays, should not be successfully operated by electrical power also. He consider that the vehicles operated by gas or oil motors may come into use in the outlying and country districts, where the absence of charging stations and the power-consuming condition of the roads militate against the electrically operated vehicles.

It having been decided to remove the accounting department of Westinghouse, Church, Kerr & Co. from their New York office to their Pittsburg office, and as this necessitated the change of residence from the East to the West of those who are in charge of this department, the engineering force of the company tendered a farewell dinner to Messrs. Warren L. Murray and Gardner W. Kimball on the eve of their departure on January 8th. The affair was held in one of the private dining rooms of Mouquin's Fulton-street restaurant, and was planned as a surprise for both guests, proving a most enjoyable affair in all respects. Plates were set for 22, there being but a single absentee, who was out of town. Mr. Walter C. Kerr, vice president of the company, sat at the head of the table, with the two guests of the evening on either side, and Mr. Otis L. Williams, treasurer, at the other end. The bill of fare had been gotten up by several of the brightest members of the engineering force, who substituted mechanical for the usual French terms, to the amusement and, in some cases, to the consternation of their brother engineers. After the dinner had gotten well under way Mr. Williams as toastmaster allowed no individual to escape, and there were by consequence 21 responses in regular order besides several which were interpolated. Mr. Kerr, in a few early remarks, expressed his pleasure at meeting the force in this form for the first time, and suggested that an annual dinner, or perhaps one more frequent, would not be a bad idea. Mr. Murray has been employed by Westinghouse, Church, Kerr & Co. for 15 years and Mr. Kimball nearly as long, and the New York office felt great regret at their leaving the East in the call of duty. A number of presentations were made to the two departing guests as tokens of esteem from their fellow employes.

ELECTRIC LIGHTING.

The Huntsville Electric and Power company, Huntsville, Ala., has let the contract for the erection of a new power house on West Clinton street. A sum exceeding $10,000 will be expended in improving the electric plant and electricity will be supplied at all hours.

A satisfactory isolated plant has just been installed in the establishment of the Jones Dry Goods company of Kansas City. A 25-kilowatt, Westinghouse, multipolar, 125-volt dynamo supplies current to 31 long-burning Jandus enclosed arc lamps and 200 incandescent lights. The plant, including the switchboard, was installed by the Hodge, Walsh & Loring Electrical Engineering company.

On the bill of complaint filed by the Massachusetts Loan and Trust company against the Citizens' Electric Light and Power company of Houston, Texas, Judge Bryant has issued an order appointing Blake Dupree of Houston receiver of the company. The Massachusetts Loan and Trust company is the holder of 150 first-mortgage bonds of the company of the denomination of $1,000 and bearing interest at the rate of six per cent. per annum. The company has defaulted on the interest on these bonds since September, 1896.

The Bureau of Information of the League of American Municipalities has begun the task of gathering statistical matter pertaining to municipal and private ownership of electric lighting plants. Statistics will be gathered from all cities and towns of 5,000 inhabitants and over to show the cost of lights under both private and municipal ownership, giving the cost of each plant, capacity, operating expenses, the items of interest, depreciation, repairs, etc. It is the intention to make a comparison between municipal and private ownership.

Newbern, N. C., people are amused by a difference between Dick Williams, who owns the electric lights of that town, and A. R. Dennison, Newbern's new Republican mayor. The mayor employed a Philadelphia expert to test the arc lights, on the supposition that Williams was not giving lights of 1,200 candle power, according to contract. The test was attempted in whole or in part secretly, and Williams got after the investigators with a shotgun, claiming that they were "monkeying" with his property. There are several law cases resulting from the controversy.

A Pittsburg dispatch states that within 12 months the catacombs of Rome will be illuminated by incandescent electric lights. The Westinghouse company has received a dispatch from its representative in Rome announcing that he had secured the contract for lighting the catacombs of St. Calixtus, St. Agnes, St. Cyraca, St. Demitilla, St. Priscilla and St. Bentianus. Some months ago the subterranean burial ground of St. Calixtus was lighted, and the effect was so satisfactory that the persons in charge decided to have electricity put in all the catacombs of the city.

ELECTRIC RAILWAYS.

The Chicago North Shore Street Railway company (the Evanston line) held its annual meeting January 17th. As the line is leased by the North Chicago Street Railroad company, the business transacted amounted to little more than the re-election of the old directors and officers.

An electric car on the Slaterville and Woonsocket (R. I.) line dashed uncontrolled down Aldrich's Hill one day last week, jumped the tracks at the foot of the hill, and, crashing through a rail fence, dropped over an embankment and landed right side up in a field. The 14 passengers were bruised and frightened and were piled on the floor of the car. None was hurt seriously.

At the meeting of the Chicago City Council on Monday evening, Alderman Gazzolo introduced an ordinance granting permission to the Chicago Central Railroad company to lay one or two tracks along the following-named streets: Commencing at the south line of Congress street at the intersection of Congress and Green streets, thence running northerly over and along Green street to the north line of Washington street, thence east over and along Washington street, passing over the Washington street bridge and viaduct, to the east line of Market street, thence south over and along Market street to the south line of Monroe street, thence east over and along Monroe street to the west line of Michigan avenue; also commencing at the west line of Green street at the intersection of Quincy street, extended, with right of condemnation, thence east over and along Quincy street to the east line of Canal, thence northerly and along Canal street to the north line of Washington street at intersection of Canal street. The ordinance permits the company to lease its tracks to any other corporation; fixes a five-cent fare; extends over 50 years, at the end of which time the city can purchase the plant by arbitration; fixes compensation by license fee of $1 a car, and provides that lines shall be completed within three years and for an indemnity bond of $50,000 within 30 days of passage of ordinance.

TELEGRAPH.

A six-mile submarine cable has been completed at Passaic, N. J., for the Postal Telegraph company. It is said to be the longest of its size ever made in this country, and weighs 125,000 pounds. Its diameter is 1¾ inches. It will be stretched across Great South Bay, between Fire Island and Babylon, giving the Postal a marine service of its own.

TELEPHONE.

New York capitalists are said to be arranging to secure a telephone franchise in Omaha. The rates at present are high, but all plans of would-be competitors have been defeated. Now the initiative and referendum is in effect in Omaha, and by this means the new company expects to get a hold.

It is asserted that the long-distance telephone record was broken on January 5th, at Gallatin, Tenn., when John H. Cross, a representative of the Bell company, talked with the operator at Norfolk, Va. The circuit passed through Nashville, Evansville, Terre Haute, Indianapolis, Pittsburg, Philadelphia, Washington and Richmond, making fully 1,600 miles.

The lowest rate charged in Atlanta, Ga., by the Bell Telephone company is $30 a year for telephones, while in Savannah, for instance, the company charges $18 for the same service. This has made the local subscribers dissatisfied, and the proposition of the Standard Telephone company to put on the $18 rate at once has been hailed with delight; but it means another prolonged telephone war.

The Creek Council at its last session granted to Captain S. B. Severs exclusive right to build telephone lines in the territory of the Creek nation. Captain Severs has been negotiating since for material to construct a network of lines connecting all the towns of importance by wire. He expects to go to work in a very short time and connect it with lines north in Kansas and south in the Choctaw nation, reaching to Denison, Texas.

The railway commissioners at Raleigh, N. C., have made a sweeping reduction in the rates for the yearly rental of telephones, by ordering the following in effect after February 1, 1898: Business telephones, special, $30; two and three-party wire, each $24; four and five-party wire, each, $18; residence telephones, special wire, $18; two and three-party wire, each, $16; four and five-party wire, each, $14. These rates do not apply to service outside the corporate limits of any city or town.

ELECTRICAL SECURITIES.

A dividend of one per cent. has been declared by the Columbus Street Railway company, payable February 1st.

Announcement is made that the $1,000,000 five per cent. collateral trust gold bonds of the Erie Telegraph and Telephone company mentioned last week have been fully subscribed for.

The last quarterly report of the Albany Railway company shows material improvement over the conditions that obtained a year ago. The gross earnings were $157,987, an increase of $20,630, and the net earnings were $55,262, the surplus being $31,107.

Ogden Street Railway company first-mortgage six per cent. bonds, principal and interest guaranteed by the West Chicago Street Railroad company, to which it is leased for 99 years, were placed on the market last week. There has been completed 34½ miles of the Ogden road, upon which these bonds are a first and only lien at the rate of $15,000 per mile.

The Columbus Street Railroad company reports gross earnings for December of $56,276, an increase of $3,753 as compared with the same month of the previous year, and net $31,242, an increase of $4,698. For the year ended December 31st the gross earnings were $[illegible], a decrease of $20,[illegible] as compared with the corresponding period of the previous year, and net $[illegible], an increase of $1,349.

Holders of Atlantic Avenue railroad five per cent. improvement bonds and Brooklyn, Bath and West End railroad five per cent. general mortgage bonds have been notified that the syndicate formed to assist in readjusting the bonded indebtedness and leasehold interests of the Nassau Electric railroad and the Atlantic Avenue railroad of Brooklyn, having purchased more than two-thirds of the bonds mentioned at [illegible] and accrued interest, is authorized to offer the same price to the holders of any of the remaining bonds, provided they are deposited on or before February 1st.

MISCELLANEOUS.

The curiosity of a pet baboon in Milwaukee led to the creature's death. The monkey was a most intelligent animal and had its home in the basement of a theater. Every since it had been in the theater it had taken a great interest in the incandescent electric lights, which were out of its reach, sitting and eyeing them constantly for hours at a time. Several nights ago it sprang up on the chandelier and grabbed one of the globes in its mouth. It probably swallowed some of the glass, for since then the baboon had been sick, and recently it died.

The postponed lecture of Edward B. Ellicott on "Fire-alarm Systems," before the Engineers' Club of Chicago, will be given on the evening of January 28th.

The Metropolitan Electric Construction company of New York city has been incorporated with a capital of $50,000, to equip electric railroads, elevators, and deal in electrical apparatus. The directors are Albert B. Chandler and Edward C. Platt of Brooklyn, E. H. Johnson of New York and W. D. MacQuesten and H. V. Jennings of Mount Vernon.

Presumably as the result of the recent acetylene explosion in Jersey City, the fire commissioners of that city have adopted regulations for the manufacture and storage of acetylene gas. The regulations provide that the manufacture of carbide of calcium or the liquefaction of carbide of calcium be prohibited except under certain prescribed limitations to be designated by the Board of Fire Commissioners, and the board declines to permit the use of any acetylene gas regenerator in the city except those devices first submitted to it for careful test, examination and approval. It is further provided that the use or storage of carbide of calcium be confined to quantities of five pounds each, which must be stored in heavy block-tin vessels, and until ready for use hermetically sealed, and that no dwelling, factory or other building be permitted to keep on storage a total quantity in excess of 25 pounds in cans or vessels of five pounds each. Those desirous of storing in the city a quantity of calcium carbide or liquefied acetylene gas in excess of the limitations given are to be allowed to do so only upon formal request to the board.

TRADE NEWS.

The factory of the American Battery company at 42 West Quincy street, Chicago, having been destroyed by fire, the new works, as well as the office, are at 174 South Clinton street, Chicago.

Huebel & Manger Brooklyn, N. Y., the well-known manufacturers of bells, annunciators, etc., are presenting to their friends a convenient souvenir in the shape of a cigar rest and paper weight. All recipients of these novelties will appreciate the favor.

The Atlantic Alcatraz Asphalt company, formerly the California Asphalt company of New York, says that it changed its name because other concerns offered their goods as coming from the California Asphalt company. This is taken as a sure sign that the company is producing good material.

To accommodate their large and constantly increasing trade Eyanson & Armpriester of Philadelphia have found it necessary to remove to Commerce street, corner of Seventh. This well known firm is the manufacturer of knife switches and switchboards, which it has installed all over the United States, and which are said to have given the best of satisfaction. It has just issued a new catalogue, "D," which will be cheerfully sent on request.

A valuable little book for all designing water-piping is the catalogue of high-pressure hydraulic fittings and flanges issued by the Tight Joint company, 159-161 Bank street, New York. Only a comparatively small portion of the pamphlet is devoted to advertising matter, the greater part being information compiled by John Hatt for the use of those designing hydraulic plants. The tables and formulæ seem to have been carefully prepared or selected and should be useful.

W. R. Mason, the agent of the Walker company in St. Louis, has just closed a contract with the St. Louis, Belleville and Suburban Railway company for two 200-kilowatt, direct-connected dynamos at 150 revolutions and eight sets of double 50 horse power car equipments complete. The dynamos are to be connected to Russell engines. Mr. Mason has but recently returned from the Cleveland factory, which he found full of work, shipments being made almost daily to all parts of the world.

The Walker company is now building at its Cleveland works a 1,600-kilowatt, direct-connected generator for the Union Railway company of New York city. This, with the two now being completed for the Brooklyn Heights Railroad company, will make three of these 1,600-kilowatt machines finished in as many months. In addition to this generator for the Union Railway company, the Walker company is building for that company 40 double No. 4 A street-railway equipments. The equipments are to be fitted with the new type S solenoid blow-out controller which has attracted so much attention. The current for these motors will be fed to the line from a Walker switchboard, now being built at New Haven. The Metropolitan Street Railway company of Kansas City, which is operating a 1,600-kilowatt Walker generator, is about to increase its plant by the addition of a generator of 1,200 kilowatts [illegible]. As a contrast to these immense machines it may be mentioned that the Walker company is building a 25-kilowatt lighting generator for Mr. J. J. Astor's new yacht. The foreign shipments during the next few months will include 100 double 3 S street-railway equipments, with 200 controllers, for Dresden, Germany; six double No. 3 N equipments with type S controllers, and two double No. 3 N equipments. Besides these railway motors with accessories there will be one 150-kilowatt belted railway generator with its switchboard and a 75-kilowatt belted booster for Japan, also with a switchboard. This makes over 7,500 horse power in street-railway motors alone that is building at the Cleveland works, to say nothing of the horse-power output in generators.

The interesting announcement that the property and business of the Missouri Telephone Manufacturing company has been sold to the Central Telephone and Electric company comes from St. Louis. The latter company was recently organized, but is energetically pushing for business. It has issued an illustrated catalogue, and says that it solicits trade on a quality basis—a good position for an independent telephone manufacturing company to take. The Central Telephone and Electric company offers to ship a pair of telephones anywhere in the United States to a responsible person for 15 days' trial. If the instruments prove unsatisfactory, they may be returned at the company's expense. The new company makes switchboards and telephone supplies, and its catalogue is sent on application to it at 1123 Pine street, St. Louis.

BUSINESS.

The Western Electric company has received another large shipment of interior conduit. This company also manufactures the Simplex tree insulator. Anyone interested in tree insulators should send for a descriptive circular.

The new catalogue of the Gamewell Fire-alarm Telegraph company of New York is a handsome one. An interesting historical sketch of the fire-alarm telegraph is given, and the Gamewell apparatus is clearly described and pleasingly illustrated.

Resistance wire is in such wide demand in electrical work that the little pamphlet of John A. Roebling's Sons company of 117-119 Liberty street, New York, on Climax resistance wire, is useful. This wire is said to have nearly 50 times the resistance of copper. Tables showing its properties for different sizes are given.

The Brunt regulating sockets for regulating the candle power of incandescent lamps, now being introduced by the Central Electric company, Chicago, are said to be meeting with a ready sale. These goods have forced their way to the front as one of the best articles of the kind yet produced for regulating the candle power of incandescent lamps.

The Cutter Electrical and Manufacturing company of 1112 Sansom street, Philadelphia, has just issued a new catalogue and price-list of its well-known I-T-E circuit breakers, embodying all the latest types—single-pole, double-pole, double-pole double-coil and triple-pole instruments being listed. This will be sent upon receipt of request, either from its office at 120 Liberty street, New York, or from Philadelphia.

The Buckeye Electric company, after a series of experiments, has completed and is now placing in the market a 220-volt Buckeye incandescent lamp. The specially prepared cellulose coiled filament, with anchor, is used. The maintenance of candle power is claimed to be absolute. Efficiency, life and quality of illumination are guaranteed to be satisfactory. J. H. Cooke reports many inquiries and orders received at the Chicago office, 753 Monadnock building.

A. O. Schoonmaker of 158 William street, New York, who has for so long been identified in the production of mica, reports indications for an increase in his line of business during the year. He has been obliged to increase his capacity of production in order to meet orders. In caring for his western trade, special arrangements have been consummated whereby a complete line of different sizes of mica will be carried at the Chicago office and also at San Francisco.

The new catalogue of the Stow Manufacturing company of Binghamton shows the manifold uses in power transmission to which the Stow flexible shaft may be put. The flexible shaft is peculiarly applicable for use with electric motors, as it exemplifies the principle of taking the tool to the work instead of the work to the tool. It enables power to be applied in many cramped positions where the tool would have to be operated by hand if the flexible shaft were not available. It also enters as a driving factor into the construction of many special devices now on the market and in general use. These are used for wood carving, cloth cutting, metal burnishing and polishing, sandpapering, stone drilling and polishing, sash, door and blind boring, flue cleaning, multiple drill[illegible], ing drills, time recorders, dental engines, surgical instruments, die work, etc. The Stow company makes electric motors especially adapted for use in connection with its portable shafts and illustrates a number of interesting combinations. [illegible]

catalogue is No. 7, and will be found valuable by all power users.

At this season of the year the amount of iron line material that enters into the business of a large supply house is indeed surprising. The Electric Appliance company, Chicago, states that it is carrying a stock of these goods that will enable it to make prompt shipments of anything up to a carload, and yet its capacity has been taxed on these goods. The iron mills throughout the country have had a large amount of business this season, and it has at times been very difficult to get iron line material. The Electric Appliance company, however, anticipated this condition, and during the season has been able to keep its stock in shape so that all orders for this material could be shipped promptly. It states that its stock is still being kept up and that customers wanting iron construction material promptly from Chicago stock will not be disappointed.

The Rochester (N. Y.) Electrical Manufacturing company has been incorporated and will at once engage in the manufacture of the electrical cut-out invented by Louis W. Miller and other devices of a similar character. The company is capitalized at $50,000 and the officers are: President, Hon. William E. Werner; vice-president, J. Miller Kelly; secretary and treasurer, George A. Brayer; general superintendent, Louis W. Miller. Mr. Miller is electrician of the police telephone service in Rochester, and his experience impressed him with need of a cut-out for use in connection with the signal service. Accordingly he invented and placed in the patrol boxes and fire-alarm boxes a cut-out that has proved of value to the city. Formerly it was a frequent occurrence during a storm for the wires running through the city to get crossed, and all of the boxes on that circuit would burn out. This would entail a considerable loss, besides leaving a portion of the city cut off from communication with the fire houses or police headquarters. But when the cut-outs were put in this expense and danger was obviated. The cut-out patented by Mr. Miller is to be put in telephones, watchmen's clocks, district-messenger boxes, fire-alarm gongs and central-office electrical apparatus.

ILLUSTRATED ELECTRICAL PATENT RECORD.

Issued January 11, 1898.

597,002. Graphite Rheostat. Edward W. Jewell, Chicago, Ill. Application filed May 8, 1897.

A working circuit forms one distinct path for the electric current, while a thin layer of graphite evenly distributed upon an insulating base forms a second path of high resistance. A contact arm is arranged to travel along the graphite layer and make electrical contact therewith, the cross sectional area of the graphite path being substantially equal at all points of adjustment of the arm, an electrical connection being established between the arm and one terminal of the working circuit, and electrical connection between the other terminal of the patient's circuit and one terminal of the graphite path, the patient's circuit and the graphite path being thus in shunt relation to each other, whereby the voltage in the working circuit varies according to the relative position of the arm upon the graphite path.

597,003. Apparatus for Stating Time and Number of Telephonic Conversations. Erich Kosanke, Carl Fuhr and Bruno Krausse, Schmiedersdorf, Germany. Application filed July 5, 1895.

In a telephone system it is proposed to employ the combination of a registering time mechabism, means controlled by the movement of the parts at the switches and called subscribers to a position for conversation for starting the register, and means controlled by the restoration of the parts at the calling subscribers for stopping the register.

597,018. Method of Regulating Speed of Series Electric Motors. Horace F. Parshall, London, England. Application filed April 5, 1897.

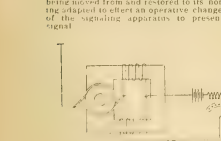
The art of regulating the speed and torque of a series electric motor consists in shunting the field coils of the motor by a source of electromotive force, imparting energy from the line to the source of electromotive force when the current is large, and taking energy therefrom to maintain the field when the line current is cut down by the counter-electromotive force of the motor.

597,036. Electric Railway Conduit System. Ralph F. Thompson, Alexandria, La. Application filed July 13, 1897.

The conduit is provided with the air and water-tight chambers, located one on each side of the trolley slot, and having insulators, trolley wires, partitions and curved projections, in combination with the trolley arms having contact wheels, friction rollers and insulators.

597,052. Telephone Exchange System. William W. Dean, St. Louis, Mo. Application filed September 22, 1897.

Two telephone lines extend from subscribers' stations and unite at the exchange, with switching apparatus for uniting and disconnecting the lines, a signal receiver at one end of the stations, a signaling generator for operating the same, a signaling apparatus adapted to present and maintain a clearing-out signal as the exchange, suitable circuit connection between the signaling apparatus and the called subscriber's line, a switch-lever adapted to change the circuit condition and the operative condition of the signaling apparatus to give a clearing-out signal, means for preserving the signaling apparatus from presenting a clearing-out signal with the switch-lever unchanged from its normal idle position, the switch-lever in being moved from and restored to its normal position being employed to effect an operative change in the condition of the signaling apparatus to present a clearing-out signal.



No. 597,052.

597,053. Telephone Exchange System. William W. Dean, St. Louis, Mo. Application filed September 22, 1897.

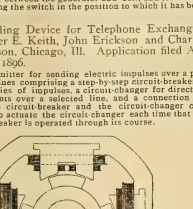
In a trunk-line telephone system the combination with [illegible] connected with two subscribers' [illegible] receiver connected with each of the [illegible] the subscribers' [illegible] the switch-lever [illegible] the battery-supplying apparatus [illegible] uniting the two lines between the subscribers' [illegible] at the subscribers' [illegible] means for holding the line in circuit [illegible] receiver at a called subscriber's station [illegible] the latter board means for connecting the [illegible] generator from the line [illegible] back for the trunk line [illegible] switching apparatus [illegible] effect the return of the generator [illegible].

597,054. Telephone System. William W. Dean, St. Louis, Mo. Application filed September 22, 1897.

One claim is given. [illegible] the combination with a plurality of [illegible] of telephone line [illegible] signal receiver at each [illegible] signal generator at each [illegible] circuit for forming a continuous [illegible] connecting plug adapted to connect and [illegible] telephone line with another telephone line, a ringing switch, a calling generator, means for connecting the generator with and disconnecting it from the ringing switch, said plug being adapted to operate or control said means to connect the generator with the ringing switch when it is manipulated to connect the second or called telephone line with the cord circuit, said ringing switch being adapted when moved from its normal idle position to open the circuit between the generator and bell, and means for maintaining the switch in the position to which it has been actuated.

597,062. Calling Device for Telephone Exchanges. Alexander E. Keith, John Erickson and Charles J. Erickson, Chicago, Ill. Application filed August 20, 1896.

A transmitter for sending electric impulses over a plurality of lines comprising a step-by-step circuit-breaker to send a series of impulses, a circuit-changer for directing the currents over a selected line, and a connection between the circuit-breaker and the circuit-changer constructed to actuate the circuit-changer each time that the circuit-breaker is operated through its course.



No. 597,090

597,090. Dynamo-electric Machine. Johannes Sohlman, Wiborg, Finland. Application filed May 22, 1897. Patented in Sweden September 14, 1895.

An even number of stationary pairs of pole-pieces projec-, radially from a casing, each pole-piece being surrounded by an induction-coil, while every two of the pole-pieces are surrounded by an exciting coil; a rotating core is placed centrally in the casing and arranged in such a manner in relation to the pole-pieces that the magnetism is fully reversed in the core during its rotation.

597,137. Static Induction Electric Generator. Adrian L. Bogart, Jamaica, N. Y. Application filed May 5, 1897.

A cylinder for an electrical generator of the static induction or influence type is made of insulating material and provided with a removable plug of insulating material, and metallic contact springs carried by the plug and adapted to contact with the stationary member of the device

597,140. Insulating Trolley Hanger. Edward J. Cook, Cleveland, Ohio. Application filed December 2, 1897.

Claim is made for the combination with the body, having a projecting portion and reduced neck and a cap fitted onto the body, an insulating bolt having a screw-threaded head fitted to the body and adapted to be engaged by the cap, and a series of malleable projections extending entirely around the base of the cap.

597,150. Means for Operating Electric Switches and Extinguishing Sparks Thereof. Jacob B. Knudsen, Chicago, Ill. Application filed June 16, 1897.

There is described the combination with contact terminals and with a switch for controlling the passage of current between the terminals, of an air cylinder, a spring-controlled piston within the air cylinder, a regulating valve provided with a discharge port communicating with one end of the cylinder, and a piston within the regulating valve for controlling the discharge port.

597,230. Electric Railway Motor. Charles J. Van Depoele, Lynn Mass., C. A. Coffin and Albert Wahl, Boston, Mass. Application filed June 11, 1895.

A means of controlling electric motors a circuit interrupter device is adapted to interrupt the circuit of the current supply at a number of points simultaneously, and current changing device effecting relative changes in the speed of the switching device during the time that the current is so interrupted.

597,250. Automatic Tender for Trolley-operating Engines. Charles E. Wilson, Brooklyn, N. Y. Application filed October 1, 1896.

[illegible] tender, comprising a suitable support, a [illegible] wheel mounted on the support, a dog carried [illegible] mounted to swing outwardly into engage- [illegible] wheel, and a device [illegible] spring connected [illegible] on plate carried by the dog, and [illegible] during the free end of the spring in a lateral [illegible] to increase or diminish its retarding effect upon [illegible].

597,172. Filament for Incandescent Lamps. Erwin F. von Wilmowsky, Boston, Mass. Application filed September 3, 1896.

This filament is composed substantially of boron.

597,202. Electric Railway. Hosea W. Libbey, Boston Mass. Application filed March 10, 1897.

An electric conductor is supported by the side of the rail, a T-piece consisting of a number of sections insulated from each other and supported by springs from the web of the rail and T-piece consisting of two sections of two kinks of hard rubber, a cylinder of soft rubber and a metal rod passing through the center.

597,213. Telephone Attachment. Philipp J. Böse, Bremen, Germany. Application filed November 16, 1896.

The telephone call-box is fitted with the usual supporting-hook; a vertical rod is pivotally supported in bearings at its ends, provided with an arm fixedly secured thereto and projecting therefrom to support the receiving instrument; a spring holds the arm toward the user of the instrument, and an arm is fastened to the vertical rod to swing across and press down the hook for closing the bell circuit when the instrument is not in use.

597,239. Primary Battery. Charles J. Hubbell and Harry C. Hubbell, Scranton, Pa. Application filed May 8, 1897.

The hollow plates or elements have a support comprising a metallic post secured within the battery-cell, and provided with spring-fingers for engaging the inside of the element.

597,244. Combination Gas and Electric Light Fixture. Joseph W. Parkin, Philadelphia, Pa. Application filed December 23, 1896.

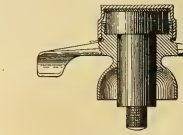
In a combination gas and electric light fixture there are a body portion having a chamber and an inlet passage, a plug in the chamber and having a wire connecting piece with the passage and provided with a passage for conductors, insulated conducting rings in the chamber and two resilient contact devices in the chamber suitably insulated and adapted to contact with the rings.

597,265. Controller for Electric Motors. Charles S. Cook, Pittsburg, Pa. Application filed January 2, 1897.

An electric motor having a shunt or compound-wound field magnet, a starting, stopping and reversing switch therefor provided with means for reversing the direction of current flow in the armature winding and maintaining a closed circuit which includes the armature and shunt windings in series with each other and constitutes the only path for current during the reversing operation.

597,282. Trolley Guard. Henry F. Hendricks and James H. Denton, Philadelphia, Pa. Application filed September 12, 1896.

The first claim is given: In a trolley, a fork, a bolt secured thereto, a trolley wheel journaled on the bolt, diverging brackets secured to the bolt at an angle to the fork, a second bolt connecting the brackets, a secondary trolley wheel journaled on the second bolt between the brackets, and star-wheels journaled on the second bolts outside the brackets.



No. 597,140.

597,306. Current-collecting Means for Electric Railway Vehicles. Charles A. Terry, New York, N. Y. Application filed September 17, 1896.

A laterally extending contact device for making contact with overhead supply conductors comprises a plurality of electrically connected rotatable elements of substantially the same diameter, and a supporting frame having a horizontal bearing-rod upon which the rotatable elements are mounted.

597,373. Electric Searing Pen. Henry Green, Hartford, Conn. Application filed April 16, 1897.

A writing implement comprises a handle, a cap, a resistance medium incased by the cap, and a searing pen embedded in the resistance medium and projecting through one end of the cap, the searing pen being insulated from the cap.

597,374. Controller for Electric Cars. John C. Henry, Denver, Colo. Application filed November 6, 1897.

The method of braking electric cars consists in changing the armatures of two electric motors propelling the car from parallel to series connection, increasing the magnetization of the fields of the motors as the current in the armatures decreases due to reduction of the speed of the motors, and then short-circuiting the armatures of the motors under separately excited fields.

Western Electrician.

EVERY SATURDAY.

Vol. XXII. CHICAGO, JANUARY 29, 1898. No. 5

Effects of the Storm on Overhead Circuits.

The severe storm of the night of January 22d had a disastrous effect on the poles and overhead wires of the electrical circuits in and near Chicago. The storm was peculiarly vicious in character, with a high velocity of wind, and rain, sleet and snow, as the temperature varied. It was in all respects one of the worst in recent years, and the telephone and telegraph wires suffered accordingly. The service on the surface electric railways, including the storage-battery road, was badly crippled for several hours, while the trains on the cable and steam roads were also delayed.

In the outlying districts of the city poles and wires were down in all directions. City Electrician Ellicott estimated that 500 poles were down in the city of Chicago on Sunday morning. The trouble was caused by the great weight of the wires, coated with successive layers of snow and ice, coupled with the strength of the wind in exposed situations. The storm created great inconvenience, but the principal danger of it arose from the failure of many of the fire-alarm telegraph lines to operate. Linemen were sent out into the storm to repair the broken and grounded wires, as fast as they could be secured, and, as a precaution made necessary by the emergency, the chief of the Fire Department caused lookout men to be placed in all the old fire towers to watch for fires and to report them by telephone. Within 24 hours, however, the telegraphic service was again efficient, and fortunately no material fire loss was caused by the defective means of communication.

The Chicago Telephone company suffered severely from the storm on its outlying pole lines carrying long trunk and toll circuits. In the downtown districts, however, where the wires are laid underground, the service was comparatively good. Thus in the district covered by the Main, Express and Harrison exchanges, with 7,472 telephones, there were only 188 "troubles" reported during the storm period. In the district outside, with a smaller number of telephones, there were over 1,000 troubles. However, the total of 1,800 troubles compares very favorably with the great storm of November, 1895, when 3,500 troubles were reported. As the storm of a few days ago was nearly as violent as that of '95, the decrease is largely credited to the improved condition of the plant. The storm also illustrated very clearly the great superiority of buried wires. It likewise proved that the protective telephone apparatus was effective, as the fuses and other devices served to save the telephones in every instance, although there were uncounted crosses with trolley and other heavy-current wires.

The accompanying illustration shows a bad breakdown of a heavy pole line, due to the storm. The photograph was taken on Cottage Grove avenue, near Sixty-ninth street. Here there is a line of about 80 wires running north and south, beside the iron fence of Oakwoods Cemetery, with a wide sweep of sparsely settled territory to the west. The line is mostly made up of telephone circuits running to South Chicago, Hammond, Pullman and Chicago Heights, although there are some of the city's fire-alarm wires on the poles. The picture shows the destruction wrought by the storm better than a verbal description. The poles—sound cedar posts—were completely broken in two, and for a considerable distance the heavy tops, with cross-arms and wires, were lying on or over the iron fence. There were several bad breaks in the lines of the Chicago Telephone company, but this was the worst of all. The company pressed all the linemen it could secure into service to repair the damage at this and other points. By Sunday night an emergency cable had been laid along the ground at the point illustrated, and this cable was in use Monday morning.

EFFECTS OF THE STORM ON OVERHEAD CIRCUITS —A BREAK IN A CHICAGO TELEPHONE LINE.

The ice and snow formation on the wires was unusually heavy. In some cases there were clearly defined coatings of ice and snow about a tiny central core of wire. In others the accumulation was of hardened snow and oval in shape. Mr. Hibbard, the manager of the telephone company, measured one of the latter, on an ordinary single telephone wire, and found it to be 11½ inches in circumference.

The lesson of a storm such as that of last Saturday night is that the added first cost of the best line construction is very good economy. Mr. Ellicott proposes to put all main-line circuits of the city fire-alarm telegraphs underground next summer, and the policy of the Chicago Telephone company in relation to overhead circuits will be to erect shorter poles and to put more wires in aerial cables and fewer bare wires on pole lines.

New Commissioner of Patents.

Charles H. Duell of Syracuse, N. Y., has been appointed United States commissioner of patents to succeed Benjamin Butterworth, deceased. Mr. Duell has been in active practice as a patent lawyer for 10 or 12 years, but is better known in the East than in the West. His father filled the same office for several years.

Chicago Has a Department of Electricity.

At the meeting of the Chicago City Council on Monday evening the ordinance creating a Department of Electricity was passed by a large majority. The mayor has approved the ordinance, which is now a law. The text of the ordinance, as introduced, was given in the Western Electrician of January 8th, and but few changes were made before final passage. It is stipulated, however, that the fire marshal and the chief of police shall retain a certain control of the chief of police shall retain a certain control of the operators and linemen in the fire-alarm and police-telegraph branches of the service, with supervision over the location of call boxes and the like. One important feature of the law is the provision that hereafter all contractors must obtain a permit from the department before entering upon any job of electrical construction work, either for new installations or repair work. No charge is made for these permits, but the applications will enable the department to keep track of all work needing inspection. Under the old law the owners, and not the contractors, were supposed to make the applications, and many failed to do so. The appointments have not been made for the department, but the principal ones will undoubtedly be as follows: City electrician, Edward B. Ellicott (salary, $4,000); assistant city electrician, David M. Hyland (salary, $3,250); superintendent of construction, William Carroll (salary, $2,000).

Inventors in Convention.

The American Association of Inventors and Manufactures was in session in Washington, D. C., last week. The association numbers among its members some of the most prominent inventors and scientists in the country, among whom are Nikola Tesla, Dr. R. J. Gatling, Albert A. Pope, Alexander Graham Bell, Elihu Thomson and others. Officers for the ensuing year were elected as follows: President, T. H. Richards, Hartford; secretary and treasurer, Arthur Stewart, Baltimore. The vice-presidents are Messrs. Anderson, Serrell, Dodge and Ely. The executive committee is made up of Messrs. Billings, Gatling, Taylor, Pope, Frazer, Stone, Miller, Schulte and Dubois.

The following amendments to the constitution were adopted:

"The object of this association is to maintain and foster the patent system of the United States, to increase the efficiency of its operation and the

stability of patent property. To accomplish these results, the association aims to strengthen public opinion favorable to the patent system, by demonstrating the enormous advantages which have been derived by the people of the United States therefrom, in the increase of manufactures and material wealth which have resulted from new machines and methods produced under the stimulus of the legal protection afforded to inventors by the patent system of the United States.

"To procure from Congress legislation authorizing the Patent Office, the only department of the government which pays all of its expenses out of its income, to spend so much of that income as may be necessary for the scientific, thorough and efficient examination of applications for patents, to the end that patents may be granted only for inventions undoubtedly new.

"To strengthen the legal remedies for the protection of such patents as may be issued after a thorough examination."

Resolutions were adopted expressing the sorrow felt by the members at the death of Gardiner G. Hubbard of Washington, who was a member of long standing, and that of Patent Commissioner Butterworth. Resolutions were also adopted favoring the removal from the Patent Office to the National Museum of such models as are not now required in connection with the transaction of business, such models being "relics of the unprecedented progress of science and the useful arts during the last half century."

The accounts of the secretary and treasurer showed that the association stands on a firm financial basis and has a considerable balance in the treasury.

Electrical Operation of a Great Grain Elevator.

By Orrin E. Dunlap.

The application of Niagara power to the operation of the Great Northern elevator in Buffalo is one of the most interesting and notable events in connection with the transmission of Niagara's energy that has yet occurred. This is so because the elevator is the greatest structure of its kind in the United States, and the use of the electric current in it marks its occupation of a field in which there is a large demand for power. This is especially true of the Buffalo elevator district, where the great grain-storage structures are very numerous about the Ohio-street transformer station of the Cataract Power and Conduit company, which acts as the distributing agent for Niagara power in the city of Buffalo.

In the Great Northern elevator the application of electric power is very neat, and use has demonstrated that it is very efficient, while to visitors it appears wonderful and novel. But then novelty is more or less notable about the entire structure, and it is in its way recognized as the conception of an original and able mind. The elevator stands on Ganson street and the Blackwell Canal. In length it is 395 feet; the width is 150 feet and the height 177 feet. Stone, steel and brick are the materials which have been allowed to enter into its construction, and it is, therefore, considered to be thoroughly fireproof. Preparatory to its erection a deep excavation was made and then thousands of piles were driven, and on this foundation an additional foundation of masonry was erected. The piles were driven from 30 to 50 feet below the water line to solid rock. On the masonry the steel columns were erected. The storage capacity of the elevator is about 3,000,000 bushels, provided by great steel bins, cylindrical in form. Of these tanks or bins there are 30 which are 39 feet in diameter, 85 feet high, with a capacity of 80,000 bushels each; 18 that are 15 feet six inches in diameter, 85 feet high, each having a capacity of 18,000 bushels, and 18 small shipping tanks, nine feet nine inches in diameter and about 60 feet high. The steel used in the construction of the bins varies from one-fourth to one-half of an inch in thickness, the total weight of steel used in the bins being in the neighborhood of 6,000 tons. The larger bins are supported on a patent circular girder plan, the idea of James J. Hill, president of the Great Northern companies. For all interior work the elevator is of such novel construction, the exterior appearance is very similar to that of any elevator, all the bins being inclosed by brick walls in which nearly 4,000,000 brick were used in addition to 250,000 on the ground floor. The brick portion of the building is surmounted by a cupola running the entire length of the top. This cupola is about 40 feet wide and 50 feet high. It is covered with corrugated iron, and on the side the name "Great Northern" stands out very prominently in large white letter

The ground floor of the building, paved with brick, contains openings, being provided so that the floor can be flushed when necessary to keep it clean, the drainage being into the canal. From the east end of this floor an electric passenger elevator, run by a 10 horse power motor, goes to the scale floor. At the west end a spiral stairway of steel, with convenient landings, leads to the upper floors. In the southwest corner of this floor an office is provided for Superintendent John Lane, whose selection for this position marks him as one of the most efficient elevator men in the country. In the northwest corner of this floor the electrical controlling equipment is placed. Both of these rooms, the superintendent's office and switchboard or transformer room, are practically stone and brick vaults, well designed to preserve the fireproof feature of the building. Looking down this floor one sees the cone-shaped bottoms of the tanks with their spouts. In the center of the ground floor there is a 50 horse power motor used to move the marine towers and also operating a cable under the building to enable the company to do car switching from the railroad yards to the elevator by electrical power. The same motor gives power to dust-collector fans, the dust collector and sweeping devices of the elevator being very complete.

The main part of the elevator building is equipped with 10 inside legs, each driven by a 50 horse power motor by means of a rope drive, a gear and pinion. These legs are about 177 feet high, carry two rows of buckets and handle about 15,000 bushels of grain per hour. Each leg is provided with hopper and scales, upon which the grain is weighed before it goes into storage. The motors for operating the legs are placed in a row on the south side of the floor over the bins and present a very business-like appearance. A 100 horse power motor for operating fans and dust collectors is also in the line near the middle. The elevator is also provided with 10 patent double-jointed distributing spouts for distributing the grain from the bins and scales, while two other spouts of the same pattern are used for carrying the grain from the cleaners to bins.

The conveyor belts in use in the Great Northern are the largest belts of the kind in use in the world, it is said. These belts are two in number, each 60 inches wide and about 740 feet long. The motors which operate them stand at the west end of the building; they are two in number, reversible, and of 20 horse power each. The belts are provided with Robinson's patent reversible self-moving trippers. Their capacity is about 40,000 bushels per hour each. In the top of the cupola the elevator heads and gearing for reducing speed are located, while on the next floor below there are 27 steel garners, each of a capacity of 1,500 bushels, and on the next floor below, or second of the cupola, there are 10 steel hopper scales, each with a capacity of 1,500 bushels. The floors of the upper stories are of sheet steel.

The elevator fronts on the Blackwell Canal, the dock between being 24 feet wide and built of stone. This dock has two railroad tracks of the standard gauge, on which are operated three marine towers, each having 32 wheels. The towers are built of steel, and each has a marine leg capable of elevating about 40,000 bushels of grain per hour. Each tower is provided with a 100 horse power motor, the current to operate which is obtained from three trolley wires running the entire length of the building on the outside at a height of about 40 feet from the ground. Trolley shoes are used instead of wheels. The switches and starters of the tower motors are mounted over the motors. The towers are moved back and forth along the dock at will on the same principle as cars on a cable line, the power for operating the cable coming from the 50 horse power motor in the center of the ground floor, as stated. As each tower has a leg capable of elevating 20,000 bushels of grain per hour, it is apparent that the capacity of the three towers is about 60,000 bushels per hour, or 600,000 bushels in 10 hours.

While the unloading capacity of the elevator is all that could be desired, its shipping facilities are equally up to modern demands. On the north side of the building there are double tracks for cars while loading, and an awning protects grain and men from undesirable weather conditions. On these tracks nine cars can be loaded at a time on either track, and in addition there is a track on the inside of the building along the north side of the ground floor. It is estimated that 400 cars can be shipped daily, also that 200,000 bushels or thereabouts can be shipped by vessels on the Blackwell Canal. At the west end of the elevator a slip has been provided with a depth of water equal to that in the Blackwell Canal, for loading canalboats, and by this means 100,000 bushels more may be shipped daily.

The power for the operation of the Great Northern elevator is generated at Niagara Falls, about 30 miles distant from the point of use, in the power station of the Niagara Falls Power company. It is developed in units of 5,000 horse power at a voltage of about 2,200. It passes from the power house to the transformer station adjoining, where the voltage is raised from 2,200 to about 11,000 by the means of transformers built by the General Electric company. At this last-mentioned voltage it is sent out on the transmission line en route to Buffalo. The transmission line now has six copper cables, or two three-phase systems. The power for use in Buffalo in the elevator district is passed through the Ohio-street transformer station and the voltage reduced from 11,000 to about 2,200. It is at this voltage that it is received at the Great Northern elevator and converted into 440 volts, at which voltage it is used. Two large converters of about 600 horse power each perform this service. The current received is of three-phase and used as two-phase. Four cables, each of 1,000,000 circular mils, run from the transformers to the main switchboard. This switchboard is of white marble and has nine panels. Upon these panels are mounted the devices for controlling the motors. All the motors are of the Westinghouse induction type, six-pole, 440-volt, 500-revolution. It will be noted that all the motors in the building, with the exception of the marine tower motors, are started and stopped from this main switchboard, also that the motors are brushless and thus sparkless, the system being adopted in order to prevent the ignition of the grain dust, which is a factor of danger in a grain elevator. So far the service of the motors has been ideal, and they can be run without harm 100 per

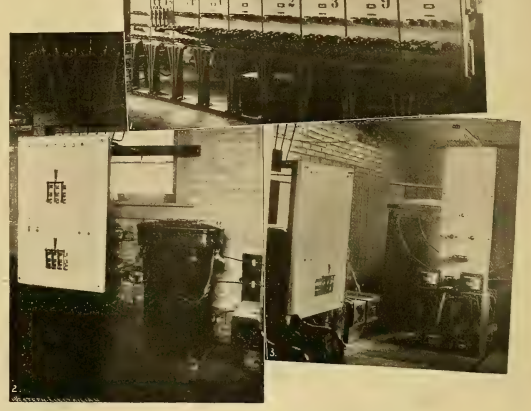


Fig. 2. Switchboard for Lighting.

Fig. 1. Main Switchboard.
Fig. 3. Six Hundred Horse Power Transformers.

ELECTRICAL OPERATION OF A GREAT GRAIN ELEVATOR.

cent. overloaded. All wiring is of open-work construction, with single-wire supports and flexible cable, rubber-covered. The lights are run on two-phase, 104-volt circuits. There are 420 lights in the building, all controlled from a board in the switch room on the ground floor and by distribution boxes for each floor. Call-bells and telephones have been established throughout the building. Views of the plant are given on pages 62, 63 and 64.

The elevator was built for the Great Northern Elevator company of Buffalo. The incorporators were Henry W. Cannon, the president of the Chase National Bank of New York, Frederick W. Bobbett of New York and W. C. Farrington of Buffalo. Mr. Farrington has been made president and general manager of the company, and Mr. Bobbett secretary and treasurer. Mr. Farrington's office is in Buffalo and Mr. Bobbett's in New York. The man who built the elevator is D. A. Robinson, who, although a young man, is recognized as one of the ablest men in elevator construction in the country to-day. Many of the unique features of the elevator are involved in the brain of J. J. Hill, president of the Great Northern railroad, a man of energy and progressive spirit. The elevator cost nearly half a million dollars, but this is only a portion of the investment made by Great Northern interests in Buffalo of late years. Close to the grain elevator on the east the magnificent steamers of the Great Northern steamship line are tied in their winter quarters, and, with their outfit, represent about $3,000,000. The construction of the elevator must be considered as a reflection of the progressive spirit of President Hill, who from a poor Canadian farm boy has risen to be a great factor in the commercial world.

Physical and Chemical Properties of Volatile Oils in Boilers.[1]

By W. H. Edgar.

It is my purpose to speak on the subject of the use of volatile oils, hydrocarbon, kerosene, and oils of that nature, in the steam boiler. I do not believe there are any cases in this country where we get petroleum or other oils in our feed-water supply, but the general laws of nature are such that our waters are heavily impregnated with lime and magnesia, which are the main ingredients, the scale-forming salts, which form an incrustation in the steam boiler, which incrustation is a poor conductor of heat as compared with iron, so that we are forced to look around for something to counteract the evil effects of this incrustation and to get rid of it if possible. This has led us to put most everything into our steam boilers, and among the different reagents employed have been volatile oils. I know that they have pumped turpentine and resinous oils into boilers up in the lumber districts; because they found in districts where they were sawing hemlock and oak that the sap and washings from them have apparently kept the boilers clean; so they thought that if they put a little of the product they were working on into their boilers it would have the same effect, it all being vegetable. These volatile oils, including turpentine and oils of that nature, are all hydrocarbons, and when they have been put into steam boilers they have caused a corrosion or general eating and deleterious effects upon the boilers from their use. In the oil fields, years ago, they put in what they called an oil brick, made from petroleum, and that was not successful; in the last few years they have been in the habit of pumping into the steam boilers kerosene, etc. I know of one man in Chicago who is at the head of some six or eight large plants belonging to one of the largest corporations we have in the city of Chicago, who put naphtha or gasoline into his boilers for years, and would persist in saying that it did the work to perfection; but he had to stop using it, due to the leaks, etc.

There are two ways of looking at this subject of incrustation and its proper antidotal reagents. A boiler is very much like the human system. We are liable to injure it, and we are liable to put something into it where the effects are worse than the disease; so we must take up both sides of the question. Now, I want to bring out a few points about volatile oils and kerosene. Kerosene is a light distillate hydrocarbon, and has been used very extensively throughout the country, as I tried here and there, and dropped for one or another reason; and I will offer these suggestions and take up these points without any personal motive whatever, for I have none; but I will just simply take up the evil effects of kerosene and petroleum and their different distillates.

Kerosene pumped into the steam boiler with the object of converting the incrustation into such form that we can readily wash it out, or prevent its formation, I shall consider in the first place. Kerosene is a hydrocarbon. If we had a carbohydrate, an animal oil, we would get an oleate radical and could possibly get the oleate of lime or oleate of magnesia, which, however, would not help us out; but we could get a chemical reaction from carbohydrate, having a combining acid radical there; but in the hydrocarbons we have no possible acid radical; we have not the base; we have not the combination that will take the place of either base or an acid radical, and we get no chemical reaction whatever, and the action of the kerosene is purely mechanical, following the laws of capillary attraction. If I dip a blotter into water, the water will run up the side and penetrate the blotter; if the blotter is set over a tumbler of water the water will penetrate through the substance of the blotter; and if you play a hose on a brick wall the moisture will penetrate to the other side. Now, kerosene, being a light volatile oil, will penetrate everything of a porous nature, such as lime, magnesia, etc., and will penetrate to a greater extent and more rapidly than water. The scale incrustation in the boiler will be softened, will be penetrated by this kerosene, due to the laws of capillary attraction; the scale being porous, the kerosene will work through to the iron; and when it comes in contact with hot metal the oil will run back of the sheet of the scale, between the scale incrustation and the iron, and when you shut your boilers, draw your fires and let out your water, your boiler contracts, the iron contracting and expanding with the application of heat. Now, you have put a substance of different physical properties, of a different nature, between your lime and magnesia incrustation and your iron sheet or plate. The lime and magnesia, little particles of them, will attach themselves to the sheet, due to the general affinity that they have for hot metal; they cling very tenaciously to the iron, and when this substance comes in between, you have lessened that adhesive property, and the incrustation is not adhering as tenaciously, and, consequently, being a non-conductor and not expanding and contracting uniformly with the iron, it is more readily scaled off, and you get a great quantity of this broken scale from the continued use of a volatile oil such as kerosene. The kerosene does not change the chemical composition of the scale; its action is purely mechanical.

Fig. 2. View Across the Line of Fifty Horse Power Motors. Fig. 1. Fifty Horse Power Motor on Ground Floor to Operate Cables. Fig. 3. The Elevator as it Appears from the Lake.

ELECTRICAL OPERATION OF A GRAIN ELEVATOR.

There are other points to be considered. Kerosene volatilizes in the steam boiler; you get probably a third over with your steam; it passes off immediately and begins to come over from about 150 degrees to 300 degrees Fahrenheit. This kerosene that passes over constitutes hydrocarbon distillate, and your steam is hydrogen and oxygen, and you know the evil effects from condensation in a steam plant; you know that every year you have in your heating system to put in a few more nipples or an elbow here and there. When you put in a light volatile oil of a hydrocarbon nature, you intensify that action; you get a series of oxidizing hydrocarbon reagents that will intensify that general pitting and grooving 100 per cent.; that is, you will get the general eating through of the joints and connections probably a hundred times as quick as you would otherwise. Besides that, the kerosene carries over into your cylinders. It is a part of the cylinder oil in the first place; the cylinder oils all come from petroleum, except the animal oils. The kerosene is a solvent for them. It dilutes your cylinder oil; it has a tendency to change its lubricating properties just that much, and with the hydrogen and oxygen of the water and the compound formed in the distillate you will get blackening of your piston rods and the deleterious general oxidizing effect on your rings, and if you have a metallic packing you will have hard work keeping your packing in your engine. From these same distillates, these same products formed in your distillation, you will have the pitting and the general eating through of all the threads of your joints and connections through your entire steam system. Not only that, but the part that is left in the steam boiler and the part that goes through your scale and reaches the iron cannot stand that high heat. It is carbonized; it is all decomposed, and in the carbonizing of the hydrocarbon oil in the presence of iron or against the iron sheet, you are going to carbonize your iron, and you will have there a blistered-appearing spot where the iron has been carbonized; it will be of a blackish, blistered appearance, and you will get that action all through the water-submerged part of your boiler. You will never get all your scale out with kerosene; you will never get more than a third, and those who are using kerosene and claim that it is working well simply look at the scale that they take out and do not look in the boiler to see what is left. I have traveled a good deal and some of my best friends tell me that they have used kerosene and their boilers are clean, their system is in good shape; and I have gone down to their plants, and looked around, and in the steam system, from the boilers to the engine, I have seen the little leaks; and when this leakage does start in and a flange gives out and you have to put a new one in, in taking that apart you jar the whole system and bring to sight more leaks where your piping is half-eaten through and almost ready to leak. Of course an old plant will show up leaks in a few months or a year, but a brand-new plant will disclose leaks in time, if you continually use kerosene.

Now, why do people want to use kerosene? It is generally the man up at the office end of the institution that clings to the practice; it is generally the superintendent or the manager that advocates kerosene, because, he thinks, it costs nothing; he is getting something for nothing. That is where so many men have made a mistake, even in the running of large enterprises and large businesses. One of the greatest dangers is to look for something for nothing. Even in the hiring of men to represent them, and in the hiring of help; in the hiring of brains around their establishment, they are not willing to pay; they want $10 put in their hands before they will give $8. A man cannot do that in business. You cannot get something for nothing and you cannot get any man to run his business without profit. This is true of boiler compounds. In the use of them the modern steam-plant owner is far behind all other branches of science. If you will, in using kerosene or using any volatile oil of that nature whatever, take the subject up and look into it for yourselves, you will find that the deleterious effects, the general carbonizing and pitting, the general eating away of that thin, natural skin of the iron (the thin skin of iron is once gone the scaling ingredients readily attach themselves to the rougher iron; while in the new boiler they cannot adhere as rapidly as they can in the boiler where the skin is gone.

[1] Address before the Northwestern Electrical association at Milwaukee, January 5, 1898.

Discussion.

George L. Thayer: I would like to inquire what the chemical reactions are that occur between the pure water and the iron and also between the mixture of pure water and the hydrocarbon oil and the iron. There has been a great deal of trouble with exhaust steam where the condensed water was absolutely pure, and a direct corrosive action on the iron being found, which is stronger at the pressure of 212 degrees than it is with the high pressure steam. The New York Steam District company laid its steam mains originally with return pipes and found that the returns were so badly corroded that they had to waste all the water of condensation instead of returning it to the boiler.

Mr. Edgar: It is purely an oxidation with the aid of hydrogen. We get the same effect there

as we would get in a boiler where you are using the water over and over again, and the water is too pure, or you are pumping rain-water and distilled water back into your boilers, and you get a pitting. The same is true as to the submerged part of the boiler; you get a pitting and grooving of the iron, and many of these pits have a scab or the appearance of a scab. If you tap that off you will find underneath a little raw sore, you might say, a hole, eating through the skin of the iron, a pit-hole, and in that hole you will find a red powder, and this powder is the ferric hydrate. You get the same thing by taking tincture of chloride of iron and adding ammonia water, precipitating ferric hydrate; and by boiling the same, as we would boil it in the pharmaceutical laboratory, it is converted into its oxides, finally going into black magnetic oxide of iron, which is a black, gritty powder, having the physical properties of the black manganese dioxide, and is found in the bottom of the boiler.

ELECTRICAL OPERATION OF A GREAT GRAIN ELEVATOR — MOTORS USED TO OPERATE THE CONVEYOR BELTS.

In this deleterious action on the piping from the distilled water you have a water which is not satisfied. You know water is the greatest solvent known to chemistry. We have no artificial liquid or anything produced by nature that is as great a general solvent as water. It must take up something in solution to keep it satisfied.

Mr. Thayer: The water acts on the iron and produces ferric hydrate with the liberation of half the hydrogen? Is that it?

Mr. Edgar: Yes; we get direct oxidation by the way of a hydrate. Also, we often pump our fresh water into the heater and get pitting in the heater and not in the boiler, which is due to lack of circulation, and the freeing of the air and oxygen held in the water, and it is almost a direct oxidation in that case; but we get a more rapid oxidation in the presence of the pure water. It is in an unsatisfied condition, and our iron is taken up as a hydrate from that to an oxide; that is, from our analysis and personal investigations we find that we have got to satisfy the water. If you could in some way get into the condensing system, that is, into the steam system, where the condensation begins to take place, and introduce something to satisfy that water, you would stop that trouble, but I do not believe you can do that. There is no way of really reaching that.

Mr. Thayer: Hot water, then, containing the carbonate and sulphate of lime and magnesia, will not exert that action except in a modified degree?

Mr. Edgar: Yes.

Mr. Ralph: What is your idea in regard to the vegetable compounds?

Mr. Edgar: Speaking of vegetable compounds, we should use sugars and tannins only, and in this way: We find that we can take care of the carbonates of lime and magnesia with tannin extracts, and that is what we want, we do not want the extracted tannic acid.

Mr. Ralph: Well, the tannin is what these lumbermen were getting when they were getting it out of their oak and different lumbers, but when they got into the pine forest they got a resinous gum, as I understand it.

Mr. Edgar: Yes, sir. We want the tannin in the extract form and still combined and containing the [illegible] matter, the sap, the [illegible] and the starch. We want that because we do not want the straight, pure tannic acid. It is too stable in itself to be readily convertible into tannates. Our object is to convert carbonates of lime and [illegible] into tannates. Now, we find that we cannot work on gypsum, the sulphate of lime, with tannin. We find that gypsum is one of the most insoluble sulphates, and that it is so stable in itself that it is not even soluble in its own acid and is soluble only in the analytical laboratory in small quantities in [illegible] acid.

Mr. Thayer: Have you worked on the magnesium sulphate, too?

Mr. Edgar: Yes. We find that sugar introduced into the steam boiler with the water will convert the sulphates into [illegible]. The [illegible] break up the sulphate [illegible] and [illegible], and in the presence of tannin [illegible] that one into tannate of [illegible] but a small proportion of [illegible] the general mixture to handle a water containing both the sulphates and the carbonates. Your sulphates and [illegible] are to be proportioned according to the percentage of the carbonate and sulphate contained in the water, determined by analysis.

Mr. Ralph: You spoke about introducing the compound into the steam heater or condenser. Do you not think that would be a good way to neutralize the effect of the water, if possible, before it went into the boiler?

Mr. Edgar: Yes, indeed. Take it back as far as you can take it through the system. The tannins in the extracted form and blended with the sugar give you no tannic acid reaction or action on the metals. You have got your readily converted tannins and they will take up lime and magnesia only, and under the conditions it is impossible to get any effect on the iron or metal. It also has no effect whatever on the gaskets or any of the substances of an organic nature in your packing. Using a vegetable mixture of that kind, you will keep your gaskets pliable. You will keep all your connections and your boiler plant intact with never a leak, and you can keep your boilers absolutely clean, and you can go to the wholesale druggist and buy the materials yourself; and it is well always to mix in a little slippery elm and pokeroot or powdered willow hardwood pulp so as to get a little soluble wood starch, so as to keep your sugars from being too stable and the tannins, likewise, so as to get readily convertible tannates and saccharates. We should not have a thing too well satisfied—we cannot change it—the actions are not there—we are in the realm of organic chemistry, where the combinations are very complex. We get a reaction a great many times in chemistry which is not true to our general text-books; that is to say, there is many a chemist who has determined something in his laboratory and completed a reaction, and he has formed a company to exploit his new method of making white lead, for instance, at one-quarter of the price at which it has been hitherto produced. He goes right on with his work; he is perfectly sincere and confident. A big factory is put up, machinery is started and everything is set going, but the results do not come. The chemist then changes everything and perhaps puts in some electrodes with a little current for the purpose of excitation, but all fails; and there has been many a fortune lost on such laboratory results. On the other hand there are a hundred and one things that take place in our manufacturing establishments on a large scale, produced by nature, that we cannot reproduce in the analytical laboratory.

Pliny Norcross: You do not recommend, as I understand it, the use of kerosene oil to remove scale in boilers?

Mr. Edgar: No, sir; under no circumstances should kerosene oil be put in the boiler. I would make the same remark in regard to caustic soda.

Mr. Norcross: Your suggestion in regard to the skin on the iron is important.

Mr. Edgar: I would advise you to get a tube that is all scaled over and seal it up at the bottom of an iron kettle and play your flame up in the middle of it, then put your kerosene and water in there and watch the action. In relation to steam heaters, I may say that I think one of these steam heaters is a good thing on hard water, for you get from 50 to 70 per cent. out. If a water is so soft that you get all the impurities out, it becomes too pure, and you pit your boilers. In the East, where

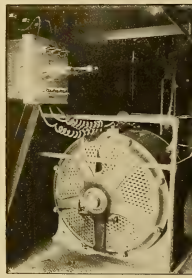
ELECTRICAL OPERATION OF A GREAT GRAIN ELEVATOR. — ONE OF THE LARGE CONVEYOR BELTS.

the soil is principally granitic, there is very little scale, only about two or three grains to the gallon, but throughout the West, where there is a limestone soil, you get from 16 to 40 grains. A surface blow-off contrivance is very good, but the trouble is that it is expected to do all the work, and sufficient interest and care are not usually taken in the application of such contrivances. The boiler is too often neglected, and it cannot get up and speak its piece like the engine when anything is wrong. You must diagnose your case and work out your own ideas. Do not forget to treat the boiler regularly. Put in whatever you use regularly. Have the water analyzed and go to the wholesale druggist and he can mix up the tannins and sugars in proper proportions; but do not use any soda. Some sulphate waters require considerable starch, slippery elm, etc.; they sometimes use five or six per cent. of carbonate of soda in boiling it together, which kills the gelatinous properties, then when you introduce your tannin extract the carbonate is converted into tannate of soda; five per cent. tannate of soda, 20 per cent. of sugar and 50 per cent. of tannins. The steam users in the country should look into this thing and should study their boilers.

Electrical Shop Transmission.[1]

By H. G. Dimick.

Under this title all the various kinds of electrical transmission might be classed, but it is not the intention to burden you with such an exhaustless subject. This paper will be confined largely to a



ELECTRICAL OPERATION OF A GREAT GRAIN ELEVATOR.— ONE OF THE 100 HORSE POWER TOWER MOTORS.

plain two-wire 220-volt system, and motors belted to line shafting in the various departments of the shop in question. The other systems used to some extent are 220-volt three-wire, the 500-volt direct current and the alternating current.

Besides connecting motors to line shafting, there is another practice which is used to some extent, that is, connecting the motors direct to each machine requiring power, doing away with all line shafting and countershafts. This method may be the most economical as regards the amount of power used, especially where the machines thus connected are not run constantly. There is more or less of this class of machinery in all factories. But the first cost of such a system is something which bars it in most cases unless the machines require not less than five horse power units to drive them; then the extra-cost question will not become so great, since motors can be purchased at an average price per horse power.

The two cases which generally come under the engineer's charge are: First, the changing from the old belt or rope drive to motor drive; second, the equipment of entirely new shops and machinery with motors. The writer would prefer the latter, after his experience with the former. The first is to be met with most frequently from the natural condition of our industrial and manufacturing world. When changing from the old rope drive to motors, it is very desirable, and sometimes even necessary, that the change should be made with little or no loss of time in operating the factory. This offers the chance for considerable ingenuity and engineering on the part of the electrician and millwrights, for they seldom find the conditions the same for any two cases. The above-mentioned difficulty, coupled with the extra trouble of having to go around old fixtures with the wiring, and locating centers of distribution, fuse cut-outs, starting apparatus, etc., makes it more difficult and expensive to install such a system than to start in with everything new. But it is sometimes still more difficult to convince the owners of this fact until they have paid the bills.

The laying out of such a plant or system requires considerable time, attention, ability and arranging of details before the real work can be done, such as the location of cables, motors, starting outfits, centers of distribution, fuse cut-outs or branch blocks, measurement of distances, etc. After all this has been done one still has the great question to decide, "How much power does each department require? What will be the minimum, maximum and average loads, and how much shall be allowed for growth or enlargement in future equipment?" In many cases he must make assumptions for these and go ahead. When these are decided one can lay out his power plant and determine the size of the generator. Here the writer can only reiterate what is practiced in all modern power plants. Put in as large units as possible and have at least one reserve machine, especially where the plant is kept running 24 hours per day. It will also be found practical to have one small unit of 50 or 100 kilowatts to run in cases of very small load, and for

1. Read before the Chicago Electrical association, January 7 1898.

extra overtime work. Of the other details of the power plant, such as boilers, fuel, pumps, condensers, feed-water heaters, steam and exhaust piping, engine regulation and economy, constant voltage, recorded daily load, efficiency, switchboard, etc., little need be said, as most engineers are familiar with such specifications already, and know what they would specify if the opportunity offer. The changing from an old equipment which is partly electrical and partly rope-driven opens another valuable field for designing temporary apparatus with the least expense, and this will be found quite difficult when one has two or three thousand amperes to collect and distribute on a dozen or more circuits. The methods of accomplishing this may be numerous, but the means used are generally indescribable. Those who have done such work would rather have it remain undescribed than to give a very exact description of its appearance.

Before describing any apparatus, the writer wishes to say that it is, or was, much easier to get out of difficulties by being in a place where they could design and manufacture just what was asked for, than to be in a position where one could only get what was on the open market, especially if that market be four or five hundred miles away, and material had to be shipped from there.

The switchboard should contain the usual outfit for the generators and circuits, such as fuses, main switches, with or without equalizer blades, circuit breakers, single or double-pole field switches, rheostats and ammeters, a voltmeter for the bus-bars, and one for a combination switch whereby all the machines may be connected with it when they are to be thrown in parallel. A recording ammeter or wattmeter in series with the bus-bars is also a

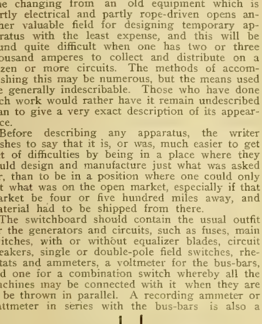


FIG. 1. ELECTRICAL SHOP TRANSMISSION.

useful adjunct if it records correctly, as is also a recording voltmeter. The distributing switches should be fully equal to their rated capacity, for times will come when it will be well that they are large. An ammeter in each circuit is also desirable, as it will save many future tests; then there should be suitable provision for a ground test through the voltmeter. This is sometimes accomplished through the regular combination voltmeter switch. A good supply of pilot lamps will also save much guess-work in operating a board.

The methods of connection on the board may be varied somewhat, but they must conform to plans already well known to most of us. For connections from generators to board, good lead-covered insulated cable should be used and run under the floor. It will be found much easier and convenient to use cables of not over 800,000 circular mils cross-section, for, if the unit is a large one, two, three or four of these may be run in parallel for each side of the circuit, and the work can be done in less time and less copper used than when one large conductor is used. The same can also be said of running large feeder circuits to various points.

Now for distribution from the board. Having the load at the different points, and the distances, the next question is to determine the drop and size of cable to produce that drop; then the kind of cable; and when we say cable, we mean stranded conductors, of which there are practically two kinds in use to-day—the rubber-covered and lead-pipe-covered, the insulation of which may be rubber or other material. There are numerous ways of putting up large feeders, chief of which are on glass or on porcelain insulators, on special clamps, in iron-armored conduit and lead-covered cables in plain iron pipe. The latter two methods are by far the best as well as the most expensive, which is as it should be. The only objection worthy of note is that one cannot tap into a circuit as neatly and as cheaply as in exposed work, while the chief advantages are that the cable will always be insured against injury and abrasion. The cables will stay in place and not be liable to be broken down, and the unsightly sags and loops are once for all eliminated. Having the cables in, the next step is to properly seal or solder the terminals. With rubber-covered cables this is comparatively easy, for they can or should be soldered or clamped directly into the fixtures. These should be made to fit them, for they seldom do fit unless made after one has the cable to go by. With lead-covered cables whose insulation is not filled with air and water-tight compounds, an extra large lead sleeve must be wiped on the end of the cable and filled with some compound which will not melt and run out on account of the heating from heavy loads or short-circuits on the line, when the sleeve points downward or horizontal. We have yet to see the ideal method of dealing with this case.

We are now ready for the sub-dividing apparatus, and a good method for this requires that there should be a switch and plug fuse for each motor circuit on each floor at the point of junction with the main risers or feeders, but it costs money to do this, and we can dispense with the switches but not the plug fuses, although plants have been put in, and many of them, with nothing but plain fuse branch blocks. Whether the first or second plan is adopted, a small distributing board may be designed with a uniform plan for any number of circuits desired, and much time will be saved afterward by its use. The diagram of the first-named board is shown in Fig 1. Another branch block, which can be used in rooms at the ends of sub-feeders from the boards just described, was very useful where more than one motor was required. In diagram it looks like Fig. 2. It is on a slate base, very durable and not expensive, considering the number of outlets. It was fitted for plain fuses, but it should have a plug switch or fuse and a fireproof cover, according to rules. When rules are mentioned, of course we all know what rules, and a word in regard to their use may not be out of the way. The writer had one of their books, and could tell nearly everything in it, and also knew of several established uses and customs among the inspectors, but he had at the very least a hundred and one cases where he had no rules to go by and had to go ahead and use his own judgment or send over to the city hall and wait a week or two before he could get an answer and proceed with his work.

We are now to the motor-starting apparatus. This should be uniform in style for the whole system; and to accomplish this, individual motor-starting switchboards should be built of uniform size on slate or similar material. The following-named apparatus should be placed upon it: A switch, a fuse, a starting box or rheostat, pilot lamps and an ammeter. The last is not absolutely essential, but it enables one to see quickly if the motor is overloaded, and it is worth the extra cost. The arrangement, design and connections of this board can be left to the person in charge to suit himself, and he cannot make a very serious mistake in it. The principal part of this outfit is the starting-box or rheostat. It has been mentioned in an older paper and it will bear repetition here: "In the first place put in a motor that is large enough to do the work without straining it or overloading it. In the second place, secure a good automatic starting rheostat. On these two points hinge the success of motor transmission."

When we take into consideration that we have from 100 to 150 motors in operation, and as many starting boxes, and if the circuit breakers open on the generator all these rheostats must automatically return to "starting point," we see how perfect our rheostat should be, and the writer has yet to see the rheostat that will always do it. Some attendant will have his switching lever tied up or tied down, whichever the case may be, and there will be a chance for an armature burn-out when the current is turned on again. The writer has had experience with three or four different makes that are on the market, and they are all subject to all sorts of trouble. Some of the old style starting equipments whose rheostats were not automatic but operated by hand are all right, but the risk of burn-outs and the fact of one plain, perfectly understood rule in the underwriters' book compel us to drop their use for "would-be" automatic ones. An automatic rheostat means one which will open the armature circuit automatically whenever the current ceases to flow from any cause whatever, and makes it impossible to start again without first having all the resistance in circuit. Lately this has come to include overloads also, which means another contrivance similar to a circuit breaker on each rheostat. The principal specifications for a good automatic starting rheostat should be something like this: It should be thoroughly fireproof, the different steps of resistance should be properly proportioned to avoid injurious sparking at the switching segments and allowing too great a difference of current to flow in the armature before it is up to speed; the switching segments should be comparatively large and massive; the contact arm should be easy to work and the contact piece itself should be the point of wear and tear, easily removable and cheap. The segments and the moving contact should be kept clean and free from all burned spots by the attendant, otherwise the rheostat will be out of order in a short time, and this is the owner's part to perform. The automatic part usually consists of a magnet holding the contact lever in the position where the resistance is all out, and when the circuit is opened, from any cause, this magnet releases the lever and a spring or gravity throws it back to the starting position. Another magnet or the same one performs a similar function when an overload comes on the motor. These magnets are connected in series with the field, in series with the armature, or across the feeder terminals. The two most common troubles are the failure of the automatic to work when it should, or it works when it should not, and the burning of the switching segments or contact. The minor troubles are the burning out of the resistance coils or magnet spools, breaking of springs, loosening of screws, overheated contacts, and many other little things that will get out of order. No one can appreciate all the troubles that will arise until he has the care of a hundred or more of them of varying sizes and diversity of manufacture for a few months. He will find all the troubles enumerated and more. Therefore a boom, financial and electrical, awaits the man who will design and manufacture for sale automatic starting rheostats that will run all sizes of motors equally well, and be without half of the troubles already mentioned.

And now a few words in regard to the requirements of the motor. The principal thing to consider is the kind of work it has to do, that is, whether it is to have a steady load all the time, or if it is to run a heavy load for a few hours and then at half load the balance of the time, or whether it is continually changing from almost no load to full or overload every few moments, and whether it is reversed very often and quickly. Then we must determine if possible from figures, comparison or otherwise, the real full load and average load in horse power. For the first class of work spoken of, get a motor whose rated capacity is about 10 per cent. more than the load expected

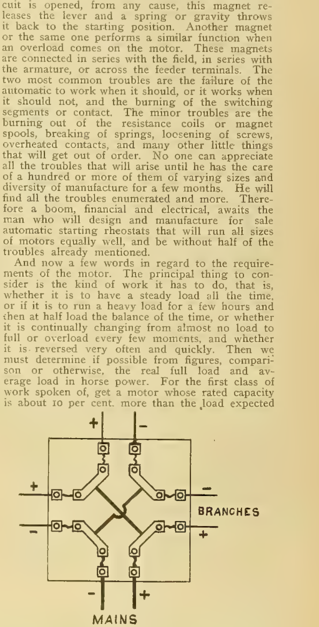

FIG. 2. ELECTRICAL SHOP TRANSMIISION.

to be put on it. For the second kind of duty spoken of, get one whose rating is about 15 per cent. more than the load. For the third class of duty, get a motor whose rating is 20 to 25 per cent. larger than the load to be handled. Of course the value of these ratings depends very largely on the style of motor and the manufacturer's method of design. The writer believes in putting in motors by this rating, even if it does cost a little more and a little is lost in efficiency, for the motors will be heavier, run slower, run cool without injurious heating, and the coils, brushes and commutators will last longer. The item of commutators is no small one, when one takes into consideration the price of a new one and the time of waiting for it to be put on. Another reason why large motors should be put in is that in large manufactories there is always room made to put in a few more machines to be driven. Although one may believe he has figured in everything possible at the beginning, somehow they always manage to put in more machinery requiring power, and all concerned are better satisfied if the motor already in is able to carry the load without working on an overload. This will hold true in nine cases out of every ten.

In conclusion, when the plant is once completed and has been running a few weeks, one will begin to see whether his calculations as regards the power required have been true, and small changes will need to be made to fit abnormal conditions that he could not foresee. A series of tests should be made on all points where there is a possible chance for betterment, such as the voltage, belt friction, line-shaft friction, etc. Apparatus can be arranged cheaply to test the amount of power consumed by each separate machine, so that one will know just what each machine consumes in doing its work and thereby add to the cost of the article the cost of the power required to produce it. Of course this means a little expense, but we must have our electrician around, and we must have something for him to do, so that both parties concerned will be prepared with the experience for future operations.

Robert Nichol of Millbank, S. D., contemplates putting in an electric light plant.

TELEPHONE, MAIN 1746.

EASTERN OFFICE: 108 TIMES BUILDING, NEW YORK.

Trade Supplied by Western News Co.

COPYRIGHT.—Not only the title but the *entire contents* of each number of the WESTERN ELECTRICIAN are copyrighted. This paper is entered at the Chicago postoffice as mail matter of the second class.

SUBSCRIPTION, in advance, postage prepaid, $3.00 for a full year of 52 numbers; in clubs of four or more, $2.50, with free extra copy for eight subscriptions; foreign countries, $5.00 a year; single copies, 10 cents. When change of address is requested, the old address as well as the new should be given.

CORRESPONDENCE relating to electricity or any of its practical applications is cordially invited, and the co-operation of all electrical thinkers and workers earnestly desired. Clear, concise, well written articles are especially welcome; and communications, views, news items, local newspaper clippings, or any information likely to interest electricians, will be thankfully received and cheerfully acknowledged.

ADVERTISING.—THE WESTERN ELECTRICIAN—**the only general electrical paper published in the West**—thoroughly covers a territory *exclusively its own*. THIS IS A CLAIM WHICH CAN BE MADE BY NO OTHER ELECTRICAL JOURNAL IN THE UNITED STATES. Electrical merchants and manufacturers *desiring western trade* will appreciate the UNEQUALED VALUE of this journal as an advertising medium in its special field. Advertising rates are moderate, and will be furnished on application.

HIGH WATER MARK

CIRCULATION, 20,000.

State of Illinois, County of Cook—ss:

Thomas Jansen, being duly sworn, deposes and says that he is a resident of the city of Chicago, in the county of Cook and state of Illinois, and that he is the foreman of the printing department of the Electrician Publishing company, the publishers of the Western Electrician; that he was present at and superintended the printing of No. 24 of Vol. 20 of the Western Electrician, issued on June 12, 1897, and that there were printed by actual count 20,000 complete copies of said Western Electrician of the volume and number above specified. And further this affiant sayeth not.

THOMAS JANSEN.

Subscribed and sworn to before me this 27th day of July, 1897.
Chicago, July 27, 1897. IRA B. JONES, Notary Public.

One interesting feature of Mr. Dimick's paper on "Electrical Shop Transmission," given in this issue of the Western Electrician, is his assertion that, after exhaustive trial, he has yet to find an automatic starting rheostat for motors that is entirely reliable and that can be safely counted as "automatic" in emergency. His experience is probably no different from that of other engineers of motor-driven plants, and yet it is to be noted that manufacturers of these devices, as stated elsewhere in this number, have again reduced their prices, which have now reached a point which seems to prohibit the turning out of a first-class product at a fair profit. The competition seems to have brought out the motto, "Not how good, but how cheap." This is not a healthy state of affairs for any branch of the electrical industry.

There seems to be no reasonable ground for objection to the new Department of Electricity which has been created by the City Council of Chicago. The new law takes the general electrical interests of the city government out of the Fire Department, where they did not belong, and puts them in charge of a distinct branch of the municipal administration on a plane of equality with the other great departments of the city government, such as fire, police, public works, and the like. This is a just recognition of the importance of the electrical development in Chicago; in this city, at least, the industry has discarded its swaddling-clothes. The actual operation of the department will show little change from that of the old bureau, only there will be greater freedom of initiative in planning and supervising the work to be done. Undoubtedly the men now in charge of affairs will be retained with new titles; and on all accounts the change seems a desirable one. We congratulate Mr. Ellicott and his associates.

Experience proves that the best possible construction of overhead wires is at times severely tested, and where inferior work is done the loss occasioned by wind, snow and sleet oftentimes cripples operating companies. Chicago was a storm center during the early part of the week, and in many parts of the city wires were down, poles were snapped off like pipe-stems and telegraphic, telephonic, railway, light and power service suspended temporarily. Aside from the danger from falling wires the inconvenience to the public is very great, and the company that passes through such an ordeal without subjecting its patrons to delay and discomfort deserves recognition and remembrance. It is, of course, sometimes impossible to withstand the fury of the elements, but in such cases allowance must be made. The storm just passed proved exceptionally trying upon the electrical companies of the city, and much more so upon the corporations whose wires extended beyond the city limits, as they were there exposed much more than in the city.

Advocates of governmental ownership of the telegraph must experience considerable pain these days because of the attitude of the Postoffice Department upon the subject of deficiency. It is the firm conviction of those who would make the telegraph system a governmental institution that the benefits of this modern method of communication should be placed at the disposal of backwoodsmen as well as city chaps. Of course the former may not, and probably will not, need it, at any rate they do not seem to be suffering because they are deprived of it, but the modern socialist insists upon giving it to them whether they want it or not and without regard to expense. That can be met along with other deficiencies. But the present administration does not appear to fancy the policy of increasing the deficiency in the Postoffice Department each year, and accordingly the word has been passed to cut down expenses. This, of course, can only be done at the expense of the service, but it is deemed unwise to continue the present course. Existing conditions, it would seem, preclude the possibility, therefore, of the government telegraph scheme receiving serious attention for some time to come.

Joliet has granted the local street-railway company a 50-year extension of the term of its franchises, under the Allen law passed by the last Illinois Legislature. The extension ordinance contains no compensation clause, and the action of the council has consequently aroused much unfavorable comment. It recalls the experience of the same city in conferring valuable privileges under similar conditions. It is claimed that not long ago the aldermen got up some speculative gas and telephone ordinances and put them through the council despite popular protest. There was no compensating feature in these ordinances. They were in the name of a "prominent citizen." This prominent citizen, however, seems to have political ambitions, and he did not relish the criticism that his action brought upon him. Consequently he took the public into his confidence and gave to the city, for library and hospital purposes, the $40,000 which he said he had realized from the sale of the ordinances. No attempt was made to construct plants under the authority conferred by them. It is hardly to be expected, however, that the street-railway company will follow the example of the "prominent citizen" alluded to.

With great persistency, middle-class Englishmen cling to the idea that it is the fault of the British workingmen, with their demand for shorter hours and their trade-union restrictions of shop output, that is causing the steady loss of trade to the manufacturers of Great Britain. The additional explanation, so patent to observers of other nationalities, that the trouble is largely with the manufacturers themselves, who are conspicuously trade egotists, entertaining the delusion that an English tool or machine or method of doing business of 30 years ago is better than one of any other country of to-day—this reason for the existing state of affairs is overlooked with dogged pertinacity.

As to the cause of the decline of the British export trade in machinery, the English are blind because they will not see. It is too much to admit national inferiority in any degree or particular, and with great haste and unanimity they fasten all the blame on the poor mechanic. The latter, no doubt, is unreasonable and perhaps blind to his own best interests in stubborn insistence on requirements about piece work, apprentices, hours of labor and the use of machines that seriously cramp the employer in competition. Still it should not lie in the pot to call the kettle black, and the manufacturer is certainly just as stubbornly English in refusing to learn from competitors who, in many lines, do better work, who adapt themselves more quickly to changed conditions of demand, and who are alert to inform themselves of the latest advances in industrial development and to make practical use of their knowledge. The English are fine machine builders, but they are encumbered by some foolish prejudices which handicap their great strength as an industrial people.

These reflections occur to one on reading a letter to the London Times by a Mr. R. Percy Sellon. This gentleman reviews the situation to combat the "unsound economic doctrines on the part of British trade unions." He restates the old indictment against the workmen, with a touch of the customary British buncombe about "the country on whom rested the blessings of free trade, industrial experience, world-wide commercial relations and unparalleled imperial and colonial possessions." But, considering the electrical manufacturing business, which was started on a level footing in all the great nations about twenty years ago, he finds that "both American and continental electrical manufacturers are underselling British-made goods in the neutral markets of the world, * * * and are to-day threatening, particularly in the respects of electric traction and power plant, to introduce ruinous competition in our home market itself." As we have pointed out, the Englishman wrapped himself in the egotistic delusion of unquestioned superiority and lagged behind the times. Now he wonders how it has come to pass that his international rivals are getting the business that he thinks should be his. Mr. Sellon states that "the capital invested in the electrical plant manufacturing industry in Great Britain has been estimated at not exceeding £4,000,000 to £5,000,000, in Germany at £10,000,000 to £12,000,000, and in the United States at £25,000,000 to £30,000,000. The output of manufactured electrical goods must be substantially in proportion." The writer thinks that the explanation of this disparity "undoubtedly lies in the conditions on which labor is obtainable." He overlooks the fatal and prejudiced conservatism of the manufacturing interest in England. The interest of his letter to Americans lies in the fact and in the statements of fact which we have quoted.

Death of O. B. Shallenberger.

O. B. Shallenberger is dead. At about 8 o'clock on the evening of January 24th, after an illness of several weeks, he passed tranquilly away.

Oliver Blackburn Shallenberger was born at Rochester, Pa., in 1860. At the age of 17 he entered the United States Naval Academy as a cadet, and from the start he took a leading position in his class, displaying even then that remarkable judgment which was such a large factor in his success. About that time Prof. N. M. Terry had begun to develop that excellent course in physics which has added so much to the reputation of the Naval Academy, and Mr. Shallenberger had no sooner entered upon that study than he began to take a special interest in the branch of electricity. His inclination from the first was toward original and experimental work. Mr. Shallenberger's course at the Naval Academy was contemporary with that of Duncan, Sprague, Hasson, Wilkes and several others whose names are well known among electricians. After the graduation in 1881, he made a cruise in the Mediterranean, returned to the United States in 1883 and resigned from the naval service the following year in order to give his whole attention to the science of electricity.

In 1884 he became connected with the Union Switch and Signal company of Pittsburg, as assistant in its newly organized electric-light department. His ability soon became apparent, and the following summer he was selected to take charge of the setting up and operation of the Gaulard & Gibbs apparatus, imported from Europe by Mr. Westinghouse, at which time his personal acquaintance with alternating currents began. After Stanley's experiments at Great Barrington, Mass., and other experiments conducted at Pittsburg by Mr. Shallenberger, the alternating-current system was adopted, the Westinghouse company was organized and Mr. Shallenberger was appointed chief electrician.

Mr. Shallenberger was one of the earliest to apply the theories then known about alternating currents to practical operation. It is said that he was the first one in America to succeed in coupling alternating-current generators in multiple. The system used for incandescent street lamps in series, with a shunt of high self-induction around each lamp, was one of his early inventions. Probably his most beautiful conceptions are exhibited in his electric-measuring instruments.

In 1891 Mr. Shallenberger was obliged to go to Colorado Springs on account of ill health, where he has since spent his winters, returning East to his home and laboratory in Rochester only during the summer months. During this visit last year Mr. Shallenberger organized the Colorado Electric Power company. He was the president of the company and acted as consulting engineer for the Westinghouse Electric and Manufacturing company.

It may truly be said that with the name of Shallenberger left out the history of practical electricity cannot be written. In view of what he accomplished in the short space of 38 years, the query is suggested what further inventions and discoveries might still have come from such a rare and enviable intellect, had he been spared and health given him. His death will be considered a personal loss by all who have been associated with him, and little less by the fraternity generally.

Topics of Interest to Central-station Men.[1]

By F. B. Badt.

When I got to Milwaukee yesterday, I found to my surprise that my name was on the programme for an address on the subject of "Topics of Interest to Central-station Men," although, as a matter of fact, I had simply asked for the privilege of saying a few words extemporaneously, to get acquainted with you, as this is my first appearance before this body.

For the last four years I have advocated the 220-volt direct-current system, and tried to get lamp manufacturers to furnish 220-volt lamps. At first they all declared that it could not be done, the thing was not practicable, it would not pay them, and they wanted to know how many lamps we could order, and many other similar questions were asked; in short, we had almost to coerce them into making us 220-volt lamps, but I find to-day, looking over the electrical papers, and I feel very good over it, that many manufacturers advertise 220-volt lamps as a specialty. In other words, the 220-volt lamp has become a commercial article.

The advantages of the direct-current 220-volt system are many. You all know that the Edison three-wire system which was recommended by Mr. Dow yesterday, expires, if my memory does not fail me, in the spring of 1901; and it was one of the main reasons of getting a direct 220-volt system, to avoid infringing on the Edison three-wire patent. Of course a straight 220-volt system is really simpler than the Edison three-wire system, necessitating only one dynamo, doing away with the neutral wire, with balancing devices to keep the two sides of the three-wire system at proper voltages, etc. Now, setting aside the patent question entirely, a 220-volt system is much more easily managed than a three-wire system. It costs less to install it, and it costs less to maintain it, if proper caution is used. We have to-day, as I stated before, 220-volt incandescent lamps, and within the last few months an arc lamp has been developed, not by one company, but by a number of companies, an enclosed arc lamp which will burn singly across 220 volts. You all know that a 220-volt direct-current motor has many advantages over a 120-volt motor, so we may say that in the 220-volt direct-current system we have a good system for small central stations where moderate distances are to be met, say three-fourths of a mile radius from the station. The 220-volt arc lamp is probably known to many of you. It is a lamp which at nominal 2,000 candle power uses 2½ amperes at about 160 volts in the arc. The arc is three-fourths of an inch long. Of course the advantage of such a lamp over running two or three lamps in series is evident. You can supply a customer with one lamp without making that lamp depend upon somebody else's lamp, and do away with all series connections. You have a lamp which practically casts no shadow. I think that such a combination of 220-volt lamps, 220-volt arcs and 220-volt motors, presents a very simple system, and a system which I think properly operated will likewise earn money.

For isolated plants the 220-volt system will, of course, only be used where there is a good deal of motor service. Now take the elevator service which Mr. Dow mentioned as probably the severest service that can be had; the 220-volt arc has again the great advantage that great fluctuations in the power circuit will not be noticeable in the arc. You take an arc of 160 volts difference of potential, three-quarters of an inch long, and it will practically not be affected by a variation in the power circuit of, say, 50 volts. Now there again is an advantage even in an Edison three-wire system of the 220-volt arc against two 100-volt arcs. In the Edison three-wire system of course the fluctuations on each side will

O. B. SHALLENBERGER

be greater than the fluctuations of electromotive force on the outside wires. The balancing requires some attention, and often it happens that one side has more electromotive force than the other. Now if the electromotive force of the outside wire is kept fairly steady, you get, of course, less variations there than on either side, and a 220-volt arc will give better satisfaction.

The enclosed arc lamp itself has made great strides during the last few months toward perfection. Our friends on the other side of the water have declared time and again, and have proven it to us mathematically, that the enclosed arc is no good; that the open arc is of greater efficiency, and has many advantages over the enclosed arc; but in spite of those theoretical demonstrations, the enclosed arc is the lamp of to-day in the United States, and the open arc for constant-potential circuits is getting out of vogue entirely. It is a back number and illustrates where theory and practice do not coincide. The American is, if anything, practical, and if the great public here decides that the enclosed arc is the thing they want, it is the thing they must have in spite of theory and efficiency or anything else. I think that it will not be very long when we will have an enclosed arc of 500 volts to be connected directly across the wires of a railway circuit. Now, there again such an arc will have great advantages over the old method of running from five to 10 lamps in series, one lamp depending on the other, making the mechanism more complicated on account of cut-outs, extra resistance, etc.; and again, an arc of, say, 450 volts difference of potential, will stand great fluctuations. Now the fluctuations in the railway circuit may be 100 volts or more, and while an arc of 450 volts will stand that, five or 10 lamps in series will be seriously affected by such fluctuations. I think the solution of the question of a good practical lamp —never mind the efficiency—for railway circuits will be found in the enclosed arc lamp burning across 500 volts.

There is another little matter that I should like to mention in connection with the enclosed arc lamps, and that is the gas-cap, as it is usually called; that is to say, the cover for the inside cylinder through which the upper carbon passes. That gas-cap has got to have an opening, of course, through which the carbon passes. Now most of the enclosed arc lamps use what is commercially called a half-inch carbon. I have calipered a hundred of them and find that they vary from .025 inch below to .025 inch above the standard half-inch. You can easily see that one of the requirements of an enclosed arc lamp is to have the carbon fit as tightly through the hole as possible, to prevent the outside air getting into the cylinder. Now if the carbon is a little too large it will stick; again, if the carbon is too small, too much air will follow into the opening and the lamp won't last the guaranteed lifetime, 100, 150, or 170 hours, whatever it may be.

Now I have also found that the different manufacturers of enclosed arc lamps—I think there are about 20 in the United States now—have not adopted the same diameter for the opening of the gas-cap. The diameters vary from exactly half an inch to about .018 inch above half an inch. Now taking that in connection with the variations in the diameters of carbons, and you can see that a man who has a few hundred enclosed arc lamps, or less, and buys carbons indiscriminately without ascertaining the diameter, may have considerable trouble; and I would suggest that this association take up the subject of standardizing the diameter of the hole in the gas-cap and urge the manufacturers of enclosed arc lamps to adopt one standard. If that is adopted, then, of course, the carbon manufacturers could be compelled to furnish carbons within certain limits.

Of course it is impossible to have all carbons absolutely of the same diameter, because there is more of less shrinkage in the baking, but we could get so near to that standard that all the trouble that they exist now would be avoided. All this refers to the direct-current system, of course.

Now, as to the alternating system, my opinion is that the single-phase system will eventually be the system. It recommends itself for its simplicity, and I think it will not be long now before we have any number of different makes of single-phase motors in the market. We have now, of course, incandescent lamps operated on alternating currents; we have alternating arc lamps; we have finally gotten a few alternating enclosed arc lamps that are good and give a life of about 100 hours with one trimming of 12-inch carbons, and if we have the single-phase motor, I think we will have the system for stations that cannot avail themselves of the advantages of the direct-current system; in other words, where conditions are such that you have to cover large areas and have to use high-tension primaries and low-tension secondaries.

Mr. Dow yesterday mentioned one objection to alternating systems, namely, that each customer had to have a transformer for the motor capacity of the dwelling or whatever it might be, and he cited that as a great disadvantage of the alternating system as against the direct-current system. Now, I think that a good deal of that could be avoided in the alternating system by using larger transformers for a number of customers. Of course you could not do it economically with 50-volt lamps; you might not be able to do it economically with 110-volt lamps; but why not use 220-volt lamps? There again, I think, is a new field for the 220-volt lamp. Use large transformers, take one transformer, if possible, for a block, and then wire the block on the 220-volt system and use group distribution, so that you get efficiency out of your transformer, and that will avoid the necessity of using a large number of small transformers, which, of course, means a good deal of money invested, low efficiency, etc.

Before I close I should like to draw your attention to something that is not exactly electrical, but in which we are all interested, and that is the steam engine. You probably are aware of the fact that the best type of modern stationary steam engine only yields us power equivalent to, say, about 13 per cent. of the energy which we find in good steam coal; in other words, there is 87 per cent. left for improvement. Compare, for instance, with this the dynamo, where manufacturers guarantee 95 and 96 per cent. efficiency, and you see that we have not progressed very much, as far as efficiency goes, in steam engines for a century. Now, the heat engine of the future will have a better efficiency, of course. It will do away entirely with boilers. It will be a heat engine that burns the fuel (no explosions), either powdered coaldust or oil, in the engine. I am not guessing when I say that I am going to see an engine which is now on exhibition on the other side of the water, and I know that a number of American capitalists are over there now trying to buy the patents. That will be the steam engine of the future. It will be an engine without boilers, gentlemen, and no explosions, as in the gas engine, but burning fuel in the engine and utilizing it for power. Now you can all figure out for yourselves what a revolution in steam engineering such an engine would produce.

One of our great street-railway magnates in Chicago has made the ridiculous statement that his franchises will last forever, no matter what the city government may do, or the laws may be. They may last as long as the present power is any good, but just as soon as we can do away with tracks in the streets and employ modern means of transportation these franchises are worth a nickel. The American city of the future, in my estimation, is to be a city without street-car tracks, with streets well paved with asphaltum or something similar, and motor cycles and motor buses passing in all directions on those pavements, and I think that the new engine will help us to realize this ideal. If we have the engine, as described before, we can make a locomotive that will do all that I have just stated

[1] Address delivered before the Southwestern Electrical and Gas Association, Milwaukee, January 26, 1898.

Electrically Driven Printing Establishment.

One of the largest and most complete electrically driven printing plants in the West is the new one of the Germania Publishing company, Milwaukee, Wis. This plant is operated entirely by electricity, all presses, book-binding machinery, elevators, ventilating fans and all other machinery of the plant being equipped with individual motors designed and built by the Northern Electrical Manufacturing company of Madison, Wis., which is

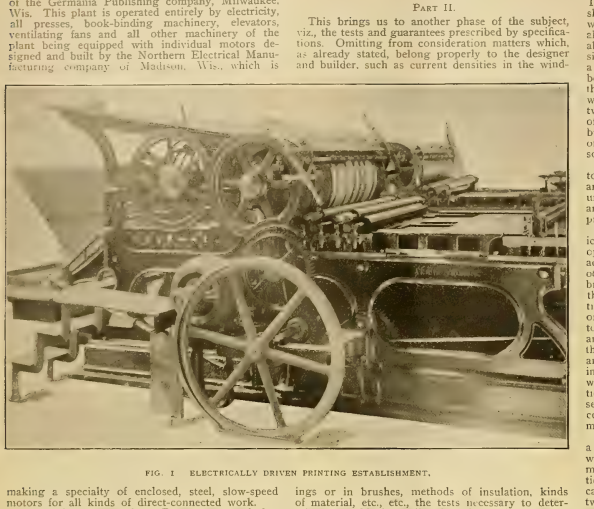

FIG. 1 ELECTRICALLY DRIVEN PRINTING ESTABLISHMENT.

making a specialty of enclosed, steel, slow-speed motors for all kinds of direct-connected work.

Fig. 1 shows one of 10 Potter two-revolution printing presses, each of which is driven by a "Northern" motor fastened directly to the frame of the press and driving the press by means of one enclosed gear of sufficient size to admit of very easy operation of the press. The motors are designed to run at a variety of speeds and to reverse at will. The system of control is such that a small lever at each side of the press, located near the feeding table, convenient for the hand of the operator, admits of complete control of the motor from either side of the press, the operator not being required to move one step from any position of work to reach his lever to change the speed, stop or reverse the machinery.

In Fig. 2 is shown one of the large Seymour inserter presses operated by a "Northern" motor geared to main drive shaft of the press, the variation of speed being effected through a controller located in front of the machine. A side rear view of this press, showing a device perfected by the Northern company for elevating and setting the large rolls of paper in their place, is given in Fig. 3. The paper hoist is operated by a motor-driven mechanism, an inverted "Northern" motor being suspended from ceiling.

These presses and equipments are used in printing the daily and weekly issues of seven of the leading German new-papers published in the West: Germania, Milwaukee; Deutsche Warte, Chicago; Deutsches Volksblatt, Buffalo; Haus- und Bauern freund, Milwaukee; Erholungsstunden, Chicago; Germania und Abend Post, Milwaukee, and Germania und Sonntags Post, Milwaukee. The Germania company point with much pride to the fact that it has now been in operation a year with its new electric plant, and has not had a single press disabled nor a single issue of its papers delayed in any way, so exacting is newspaper.

There are three elevators in this building, two of which are operated electrically by two direct-connected "Northern" motors.

A "Northern" direct-connected generator, driven by an upright engine, is placed in the basement of the Germania building, is shown in Fig. 4. The Northern company now has upon the market 20 different sizes of generators, in belted and direct-connected types, up to and including 200-kilowatts, making a line of direct-current motors and generators one of the most complete to be found upon the American market.

Oconto wire is used throughout the plant. It was furnished by the Crocker Electric company.

Carbons Wanted.

The Electrical Department of the city of Chicago is in the market for 1,000,000 carbons for arc lamps. Solid carbons, five-eighths inch in diameter and 13 inches long, are needed. The city electrician, Edward P. Ellicott, can give further information.

The Relations between the Customer, Consulting Engineer and the Electrical Manufacturer.

By S. Dana Greene.

Part II.

This brings us to another phase of the subject, viz., the tests and guarantees prescribed by specifications. Omitting from consideration matters which, as already stated, belong properly to the designer and builder, such as current densities in the windings or in brushes, methods of insulation, kinds of material, etc., etc., the tests necessary to determine a machine's quality (and hence its value to the purchaser) are few in number and can be enumerated under the headings of efficiency, heating, regulation, sparking and insulation. If the requirements under these five headings were formulated under some general rules, and if the methods of tests to determine results were uniform, the work of the consulting engineer and the manufacturer would be vastly lessened. Such, unfortunately, is not the case, and specifications on these points vary widely both as to requirements and as to the method of test. It seems practically impossible for the various manufacturers and consulting engineers to standardize these requirements and tests by any concerted action, and the only other solution of the difficulty is for some scientific, non partisan organization to undertake the work. The American Institute of Electrical Engineers is just such a body, and it would render a great service to the entire electrical business if it would consider the matter. Without attempting in any way to suggest what action it should take, it seems proper to call attention to some of the points which most frequently give rise to misunderstandings and disputes.

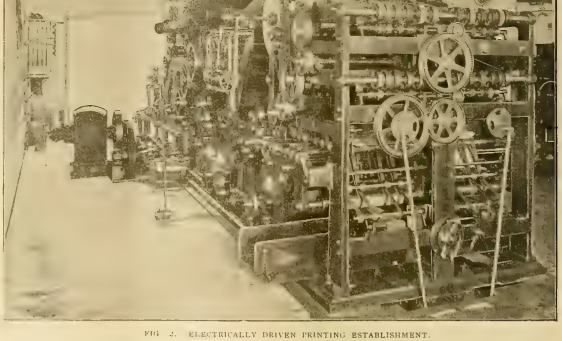

FIG. 2. ELECTRICALLY DRIVEN PRINTING ESTABLISHMENT.

1. Efficiency.—The proper distinction between electrical and commercial efficiency is not made. The latter is what interests the purchaser and it should always be specified. A clear statement of what losses must be included to determine it, and also a general statement of what constitute reasonable and proper commercial efficiencies in well-designed machines, would be of great service. Such a statement should show the necessary difference between carbon and copper brushes, and between the voltages most commonly used in direct-current work, viz., 125, 250 and 500 volts, as well as between machines of various sizes. The formulation of such information on alternators is more difficult, but all manufacturers have certain standard lines of these machines, and it is quite possible to make some intelligent general rules.

Electrical manufacturers are sometimes required to guarantee the combined efficiency of generator and engine (or other prime mover). This is clearly unfair and shifts the direct responsibility of guarantee from the maker of the prime mover, where it properly belongs.

2. Heating.—For all ordinary conditions of service, the safe heating limits for continuous full-load operation can be determined with a fair degree of accuracy. The commutator heats more than any other part of the machine, particularly with carbon brushes, a fact which is often ignored. Sometimes the heating is measured by thermometer, sometimes by increase in resistance. There should be one uniform method followed. Overload guarantees (ranging from 25 per cent. to 100 per cent.) are sometimes required for a period within which the ultimate temperature of the machine is reached, and the necessary capacity of the machine is thus increased as certainly as though a larger machine were specified. It would seem that the time duration of overload tests should bear some relation to service conditions. If the service requires a 50 per cent. overload for eight hours or more, a larger machine is evidently necessary.

3. Regulation.—Specifications frequently call for a straight line compounding curve, a condition which is practically impossible until we discover a magnetic material which has a straight line saturation curve. Another common requirement in the case of lighting generators is that a drop of, say, two per cent. in speed shall not affect the electromotive force more than two volts, which is also an impossible condition, even with a separately excited generator. A reasonable margin in either case, having due regard to the service for which the generator is intended, should always be allowed.

4. Sparking.—Modern design and the use of carbon brushes have greatly reduced the trouble from sparking, but machines are sometimes called upon to stand excessive overloads without sparking, which can be accomplished only by using a larger machine or by the distortion of design, which is bad practice. Any good machine, with carbon brushes, should be able to stand a variation from no load to full load without movement of brushes and without noticeable sparking; it should also stand a reasonable overload, say, 25 per cent., without injurious sparking.

5. Insulation.—This is a cause of frequent trouble and annoyance. The common practice is to specify an insulation resistance of so many megohms, regardless of the size of the machine and the voltage and conditions of service. Considering the

fact that this resistance varies inversely as the area of surface to be insulated, and considering the enormous variations in size, shape, voltage and service requirements of different machines, it is evident that such a test is impracticable and means little or nothing. Insulation resistance is largely a question of dryness, and if an armature be baked for a sufficient length of time, almost any resistance within reason can be obtained. I have known a large 400 kilowatt lighting armature to measure a

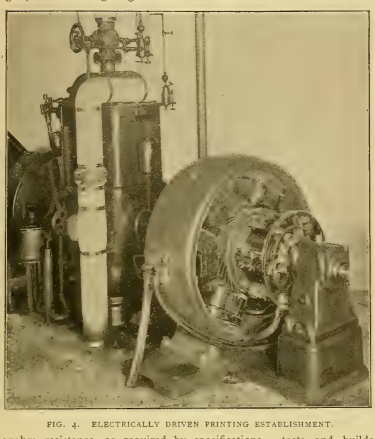

FIG. 4. ELECTRICALLY DRIVEN PRINTING ESTABLISHMENT.

megohm resistance, as required by specifications, after several days' baking (which, by the way, permanently injures the structural strength of the insulating material) and yet it showed practically no resistance when it reached its destination, because it had been in the rain and dampness for a week or more, and the large surface naturally afforded an excellent lodging place for moisture. A day's run in a weak field, with the armature short-circuited, quickly brought the insulation up again.

The only proper way to insure good insulation, with reference both to the material used and the method of construction employed, is by a high-potential test applied when the machine is reasonably dry. This test should be intelligently gauged by the voltage of the machine and the service required. Thus a high-potential test of 1,000 volts is ample to detect any insulation weakness in a 125-volt lighting generator, while a 5,000-volt test is ample for a 1,000-volt alternator, allowing proper factor of safety in each case. Recent careful investigations have developed the fact that the only correct way in which to determine the proper high-potential test for any given machine is to consider jointly the time duration of test, the current frequency and the voltage of machine. As the latter rises, the margin between it and the test voltage necessarily decreases on account of the liability to permanent injury of the insulation when subjected to excessive voltages. Because 5,000 volts is found to be a proper test voltage for a 1,000-volt machine, it by no means follows that 50,000 volts is proper for a 10,000-volt machine, or that the apparent factor of safety should be the same as the voltage rises. There should be a careful formulation of proper high-potential tests for different classes of apparatus, based upon scientific investigation and tests, and it is believed that it would not be a matter of any great difficulty to formulate such a schedule.

It is earnestly to be hoped that the Institute will consider that these questions come properly within its sphere of action, and that it will take action in a matter of so much moment to all concerned. It should be remembered that where special conditions are imposed which lead to deviation of design or to the manufacture of special apparatus, the purchaser, no less than the manufacturer, is bound to suffer, and it is the purchaser who pays the bills, directly or indirectly. If the purchaser finds himself involved in unexpected expenditures, the consulting engineer, too, comes in for his share of blame and dissatisfaction.

We come finally to the commercial requirements which have gradually found their way into specifications, and which are sometimes onerous and unfair. Perhaps the most important of these is the question of shipments. It is not uncommon for shipment to be specified by a certain date, under a forfeiture of so many dollars a day for each day's delay thereafter, and the award of the contract is often largely affected by such promises. The manufacturer starts the work in his shops, and if the time is short he is apt to work overtime. About the time the apparatus is ready for shipment, and without any previous warning, word comes to withhold shipment because the purchaser is not ready to receive it. There were recently 15 carloads of apparatus lying in the yards of one of our manufacturing establishments, besides a number of large machines stored in the shipping and testing departments, which had been made on time contracts and held at the last moment by request of the customer. It is difficult for one not in this end of the business to realize the resulting demoralization throughout the shops, and it is a condition which could easily be remedied by the exercise of more foresight on the part of the purchaser and his engineer. In all cases where a penalty for delay in shipment is imposed, it is fair and reasonable to ask that a similar bonus should be awarded if shipment is made in advance of promised date, or if the purchaser is unable, through no fault of the manufacturer, to receive the apparatus on that date. It is sometimes required that the consulting engineer shall have full access to the shops at all times while the apparatus is in production. Such permission is impracticable if proper shop administration and discipline are maintained, and these visits should be made at certain specified stages of the work. It is, of course, always proper for an engineer to be present when the apparatus is finally tested.

A clause is commonly found in specifications providing that the consulting engineer shall be sole judge of the true intent and meaning of the specifications; and in case of any dispute thereunder his decision shall be final and binding. It is true that this clause is common in architects and builders' contracts, but it is doubtful whether it could be enforced at law, in case of a dispute as to facts, and it certainly seems fair that in case of such a dispute, where the two parties honestly disagree, provision should be made for a third, disinterested party to act as arbiter.

While there are many contracts executed which involve one or more of the provisions (technical or commercial) mentioned above as liable to cause trouble, and where no trouble is experienced, due to the common sense and good judgment of both engineer and manufacturer, still the cases where trouble does arise are not infrequent, and the best

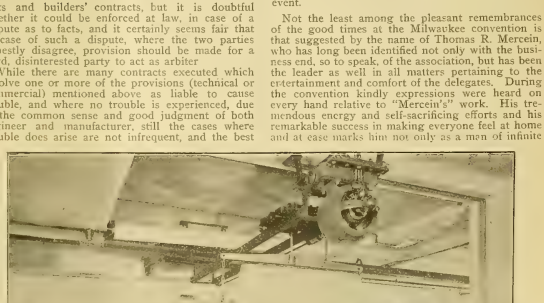

FIG. 3. ELECTRICALLY DRIVEN PRINTING ESTABLISHMENT.

specification is one so fair and so clear that no dispute or misunderstanding can arise, except with malicious intent, and which requires no arbiter to interpret its true intent and meaning.

In conclusion, let us hope that the customer, the consulting engineer and the manufacturer will, in the future, consult each other more freely and frankly, by personal interview or by correspondence; and that all of them will unite in indorsing any intelligent attempt to standardize such tests and technical requirements of electrical apparatus as are matters of common usage in our daily business intercourse.

DISCUSSION.

Lieut. Greene's paper was discussed by Max Osterberg, Gano S. Dunn, C. O. Mailloux, H. B. Coho, C. E. Emery and F. B. Crocker. The following resolution was duly presented and adopted:

"Resolved, That in view of the excellent suggestions and recommendations on standardizing apparatus embodied in Mr. S. D. Greene's paper, the society hereby expresses its approval of efforts in that direction, and invites the American Institute of Electrical Engineers to consider some comprehensive plan for such standardization of American apparatus for electric light and power."

Convention Echoes.

One of those who drifted into Milwaukee during the recent Northwestern Electrical association convention to have a glimpse of the boys was General Manager S. M. Hamill of the Brush company. Mr. Hamill now spends a large portion of his time in and about New York and Schenectady, and it was a pleasant surprise to see his face at a meeting so far west. He only remained a day, but even that short time was sufficient for him to have the opportunity of reviving a host of old acquaintances.

Meysenburg & Badt have already received many compliments upon the excellent showing they made at the Milwaukee meeting of the Northwestern Electrical association. Their display of Helios enclosed 200-hour arc lamps for 110 and 220 volts on direct-current circuits attracted considerable attention, and they have already received several inquiries. These lamps take five and three amperes at 110 volts and 2½ amperes at 220 volts. A 100-hour alternating enclosed arc lamp at 115 volts received its share of attention. It may be mentioned, too, that the exhibit of K. & W. specialties has stimulated trade in this line throughout the Northwest, especially in Hardy incandescent lamps, composite dynamo brushes, spark arresters, commutator compounds and open arc lamps. Mr. Badt says that his experience at Milwaukee was entirely satisfactory, as it enlarged his acquaintance among central-station men of that section and placed him in the way of doing considerable business. One sale of considerable importance was credited to the trip, and several deals that are still pending were further results of the event.

Not the least among the pleasant remembrances of the good times at the Milwaukee convention is that suggested by the name of Thomas R. Mercein, who has long been identified not only with the business end, so to speak, of the association, but has been the leader as well in all matters pertaining to the entertainment and comfort of the delegates. During the convention kindly expressions were heard on every hand relative to "Mercein's" work. His tremendous energy and self-sacrificing efforts and his remarkable success in making everyone feel at home and at ease marks him not only as a man of infinite tact but as a prince of entertainers. Mr. Mercein has several times essayed to resign the secretaryship, but has each time so ignominiously failed in his effort to escape that his many warm friends have persuaded him to give up trying and yield to the inevitable. It would be difficult to find a more accomplished toastmaster, and it is safe to say that the pleasant tones of the "silver-tongued" secretary are still ringing in the ears of many who visited the '98 meeting of the Northwestern Electrical association convention.

A. L. Severance of the Pfister Hotel acquitted himself most creditably during the recent North-

western Electrical association convention through his unceasing efforts to further the pleasures and comforts of the delegates, not only during the three-days period of the convention, but even before that time. When it was decided that the convention would again be held at the Pfister Hotel, and this decision, it must be stated, was secured practically through Mr. Severance's energetic efforts and strong personal following, his first step was to send to every possible convention visitor a token of the hotel's good-will and earnest desire to further the interests and comfort of all to be present. During the convention period Mr. Severance was constantly on hand, and particularly the night of the banquet, when he saw that the difficult task of seating people at tables holding large numbers was carried out without a hitch. Mr. Severance, as is well known, has been for years in the hotel business, and was formerly connected with the Cadallic Hotel, Detroit. His experience with the traveling electrical public proved valuable during the convention, and it is safe to say that under his management the Pfister Hotel has bright prospects. It may also be stated that during his management the hotel's patronage has wonderfully increased.

A meeting has been held of the committee of the Northwestern Electrical association having in charge the subject of holding a mid-summer convention of that association. The suggestion of naming a date for the summer meeting to immediately follow the date of the meeting of the National association at Chicago was discussed, and Joseph M. Hill of the committee was delegated to confer with Samuel Insull, president of the National Electric Light association, on the matter. In this connection it is interesting to note that at a meeting of representatives of electrical interests of St. Louis at the Planters' Hotel on January 24th, the following committee was selected to organize a club for the purpose of securing as large an attendance as possible to the conventions of the National Electric Light association and the Northwestern Electrical association, providing that the meeting of the Northwestern Electrical association should immediately follow the meeting of the National Electric Light association in Chicago: A. C. Garrison, representing the Columbia Incandescent Lamp company; E. H. Abadie, representing Wagner Electric Manufacturing company; John C. Murphy, representing Fort Wayne Electric corporation; Joseph Franklin, representing Commercial Electrical Supply company; W. R. Mason, representing Walker company; H. A. Wagner, representing Missouri Edison company; Frederick W. Schlosser, representing Laclede Gas Light company; H. M. Humphrey, representing Bryan & Humphrey, consulting engineers; H. F. Broughton, contractor; C. Pattison, representing Westinghouse Electric and Manufacturing company; Richard McCulloch, representing Citizens' Street Railroad company; George D. Rosenthal, representing General Electric company. The plan for the proposed convention of the Northwestern Electrical association, three days of which are to be on board steamer and two days at Duluth and Superior, was received with favor, and those at the meeting agreed that they would make every effort through their agents and in other ways to make it large and make an organization as possible for the benefit of both associations. A. C. Garrison was elected chairman of the committee, and J. L. Murphy, who is a member of the committee, has written to Mr. Hill that he hopes to get representative of the Missouri and Texas lighting and traction companies to attend the meeting of the Northwestern association.

The city fathers of Gainesville, Ill., have closed a contract with the electric light company for lighting the streets.

Brown Emergency Device.

From the early days of steam engineering it has been apparent that a very quick closing valve which could be controlled from a distance would prevent a large part of the accidents to which steam machinery is subject, and in modern practice, which demands the use of very high pressures and high speed in steam and electric power plants, such a valve becomes more and more a necessity.

In case of the bursting of a large steam pipe, either in stationary or marine practice, it is usually impossible to get at the boiler valve to shut off the steam, until the boilers have emptied themselves through the fractured pipe, which, of course, makes it impossible to render any assistance to those who may have been overcome by the escaping steam or prevent the damage usually attending such accidents.

Another very serious class of accidents which have become common of late is the bursting of flywheels of large engines, due to increase of speed, which may have been caused by some very slight disorder of the governing gear or other cause. These accidents are often as destructive to life and property as the bursting of boilers.

The valve herewith illustrated, with its attendant auxiliary means of control, is the invention of G. W. Brown, and consists of a simple disk screw valve to which has been added an emergency piston which operates entirely independent of the screw and in no way interferes with its action, and which can be controlled from a distance, by automatic or manual means, to cause it to close itself by steam pressure instantly.

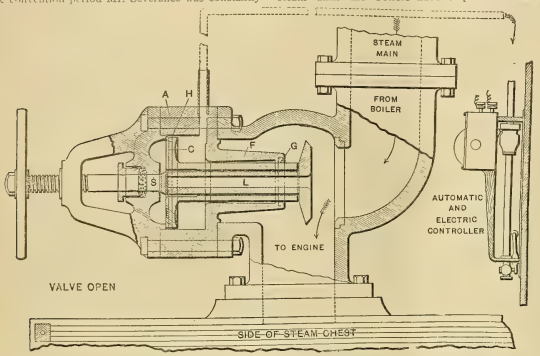

FIG. 1. BROWN EMERGENCY DEVICE.

On the common form of valve body is bolted or cleated a cylinder A; upon this cylinder is attached the usual bonnet or cover which carries the screw and hand-wheel (Fig. 1). In the cylinder is a piston, C, provided with a loose-fitting ring, H, around which steam is permitted to leak. The rod, F, also loosely fits a ring, G, and the screw plug S presses against the valve stem but is not fastened to it, covering or closing the passage L when the main valve is open, also when closed by the hand-wheel, as in Figs. 1 and 2.

When closing the valve by the hand-wheel, the spaces M and N being filled with steam, the valve simply acts as a screw valve, the pressure on the underside of the valve disk keeping the valve stem forced against the end of the screw, S.

To close the valve instantly, as in Fig 3, it is only necessary to open the vent, or relief pipe, E, by automatic or manual means, which takes the pressure off the under side of the piston, allowing the pressure on the top to force the valve to its seat. The piston having a much larger area than the valve, it has a large surplus of power to overcome any resistance or steam pressure against it.

As long as the screw remains out, the steam passing through the hollow stem L maintains boiler pressure on the top of the piston and holds the valve shut, but it can be opened instantly by closing the vent, or relief pipe, and turning the screw in to close the passage, L, then turning the screw back.

The vent, or relief pipe, is a small iron or brass pipe which may be extended to any part of the engine or boiler room, or outside of the same if desirable, and be provided with small screw or lever valves at convenient points, the opening of any one of which, by hand or other means, will cause the main valve to close by the emergency piston. The same principle is applied to the gate type of valve as well as to the globe and angle type, but through somewhat different methods.

To guard the engine automatically against running away and the consequent bursting of the flywheel, the relief pipe is extended to a controller which is provided with a small lever valve at the end of the relief-pipe connection, a tiny weight sliding upon the same and which in falling opens such relief valve, a small governor (driven by a small band connection with the engine shaft) controlling the weight. This governor is adjusted to drop the weight to open the relief valve and cause the throttle valve to close, when the overspeed of the engine reaches the predetermined danger point, and which when once adjusted to such speed requires no further attention. The bearings of the governor run on fiber graphite and require no oiling.

To give control of the engine from a distance and guard against accident to operatives and machinery in mills, factories, etc., the different floors or rooms are provided with electric push-buttons connected with an electric device operating through an electro-magnet in the controller. The pressing of any of these buttons operates the controller, causing the engine to stop, the same as in the automatic action. These push-buttons are of peculiar design, enclosed in small iron boxes and so arranged that they cannot be reached without ringing a small alarm bell, which prevents tampering by the inquisitive, and also furnishes a means of testing the electric circuit without closing the main valve.

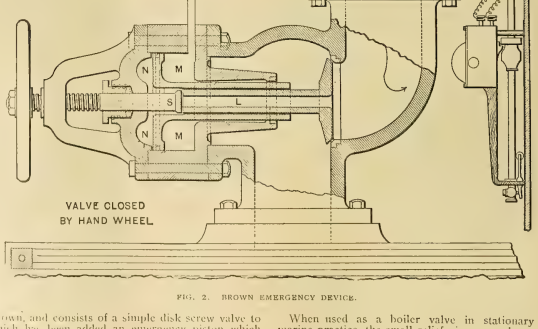

FIG. 2. BROWN EMERGENCY DEVICE.

When used as a boiler valve in stationary or marine practice, the small relief pipe runs along the steam main and enters it at some convenient point. Should the main steam pipe burst, the fall of pressure in the relief pipe would cause the valve or valves with which it is connected to close. It may also be operated electrically and manually from distant points of safety in a ship or building. When used as a throttle valve on marine engines it is further provided with an easy lever adjunct, which does not interfere with the screw or emergency action.

The Electro-steam Appliance company of 320 Broadway, New York, controls the manufacture and sale of this apparatus and owns the patents covering the invention.

Cartwright Enclosed Air-tight Fuse.

The Cartwright enclosed air-tight fuse is manufactured by the Shawmut Fuse Wire company of Boston under license from the Goodhart Electric company. In this device the fuse is so constructed that the wire melts within the central section of the tube, and the heated air and gases formed thereby, forcing themselves to the outer or end sections, blow out the arc. This fuse can be used on any pressure less than 2,200 volts. It will not maintain an arc between its terminals when short-circuited on the mains of a 2,200-volt composite alternating dynamo.

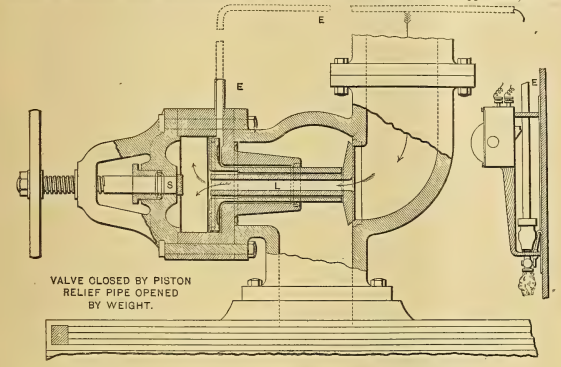

FIG. 3. BROWN EMERGENCY DEVICE.

The cut-out consists of two parts, the base and tube. The base is made of the best quality of Monson slate; the tube is made of black or gray fiber. Fig. 1 depicts the cut-out complete. Fig. 2 shows the fuse with the central part of the case cut away to show the fuse wire in the central air-space and also the filling at each end, while Fig. 3 represents a 50-ampere fuse cut open after it had been short-circuited on a 500-volt circuit of 450 kilowatts capacity and had opened the circuit without noise or flash.

Owing to the peculiar construction of this enclosed safety fuse, a tube or case three inches long will open the circuit, where other devices require more than twice that length, operated under the same conditions and with a fuse of the same carrying capacity. This fuse has a definite length, cannot come in contact with any foreign substance, and it will open the circuit in a predetermined time on a given current in amperes. Each fuse is marked with the number of amperes it will carry indefinitely; it will melt on a 25 per cent. increase of current.

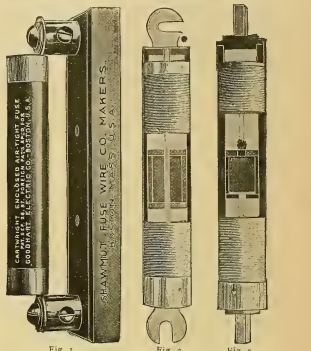

Fig. 1. Fig. 2. Fig. 3.

CARTWRIGHT ENCLOSED AIR-TIGHT FUSE.

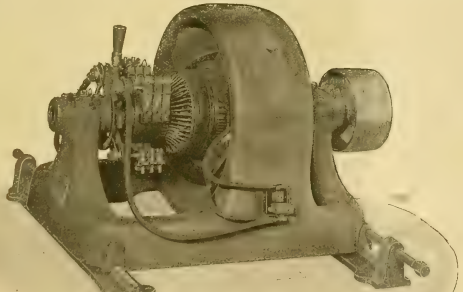
No More Steam Roads for Connecticut.

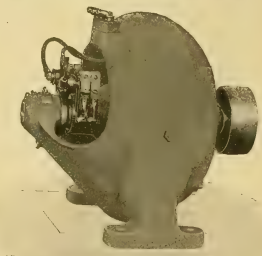
The annual report of the Connecticut railroad commissioners shows that there are 385 miles of electric railroad in the state, an increase of about 32 miles over last year. The 29 companies have $9,770,440 of stock issued. Their bonded debt is $7,092,800 and floating debt $1,071,421. They carried last year about 43,000 fewer passengers than they did in 1896. They paid in dividends $265,623, as compared with $221,119 in 1896. The commissioners say that no more steam roads are likely to be built in Connecticut.

New Dynamos for Moderate Speed.

The General Electric company announces a line of new and improved slow and moderate-speed belt-driven generators for both lighting and power purposes. The features of excellence in the older styles have all been retained, and while the new line is somewhat different in appearance, it embodies all the improvements suggested by experience with the older types.

These machines are of the four-pole type in the larger sizes. Fig. 1 illustrates the design. The construction allows of economical distribution of the magnetic material, while by shortening the magnetic circuits the exciting current is reduced and the efficiency increased. Reduction in speed implies increase of weight if the same output and efficiency are to be obtained, but low speeds with small weight per kilowatt are possible in these machines, owing to the economy in material effected by the adoption of the four-pole type. As the frames are of the highest quality of iron and the pole-pieces of special soft steel, these generators are lighter than even others of the same output but higher speed. The floor space occupied is small; the frame is strong, rigid and graceful, and the dimensions are as small as possible consistent with stability





FIGS. 1 AND 2. NEW DYNAMOS FOR MODERATE SPEED.

The pole-pieces are detachable from the frame, and thus the field coils are removable without disturbing the armature. The armature is built up of japanned sheet-iron laminations assembled on a cast-iron spider. Air ducts separate the laminations into groups and provide for thorough circulation through the windings, core and spider. The windings are copper wire coils, formed and insulated before assembling on the core. In some of the larger sizes copper-bar windings are used. By means of a projecting spider, the windings are bound down solidly and additional radiating surface provided. This method of construction insures perfectly insulated coils and renders failure of insulation, due to abrasion, practically impossible. The armature insulation is similar to that used on the General Electric railway motor armatures. It is tough, impervious to moisture, and, unless exposed to extraordinary overload, practically indestructible. It offers a high resistance to puncture, rendering injury by lightning impossible. The commutator is built up of special hard-drawn copper and mica of the finest quality. The brush-holder boxes which hold the carbon brushes are connected to the stud by a solid shank, insuring correct brush setting and firm and accurate contact with the commutator. A flexible conductor permanently attached to the brush forms perfect connection to the brush holder. Adjustments for pressure are made by a thumb nut and pressure spring. The pillow blocks are cast with the bed-plate, and the bearings are self-aligning and self-oiling.

These generators are sparkless, and the brushes, being of carbon, require no shifting in changing from no load to overload. The only wear on the commutator is that due to friction, and the use of carbon brushes reduces this to a minimum. The rise in temperature in any part of the machine, except the commutator, will not, it is claimed, exceed 45° Centigrade, after continuous full-load run of 10 hours, while the temperature rise of the commutator under the same conditions will not exceed 55° C.

The four-pole machines of the slow-speed type are built in capacities from 6.5 kilowatts to 75 kilowatts; of the moderate-speed type from nine kilowatts to 85 kilowatts. They are wound for 125, 250 and 500 volts. Many of them can be adapted for direct coupling to engines by mounting the machine on an extension of the engine bed, and connecting the armature to the engine shaft through a coupling.

The smaller sizes of the slow and moderate-speed generators now being built by the General Electric company are of the bipolar type, and, while embodying the same style of construction as the four-pole machines, differ greatly in appearance, as may be seen by reference to Fig. 2. They are known as L. B. (ironclad bipolar) machines, and, as will be noticed, have a field frame completely surrounding, and protecting from mechanical injury both field spools and armature. The small size of these generators, their compactness, and the small floor space occupied render them peculiarly suitable for small

isolated plants, and being adapted for direct driving, they make neat sets for small yacht and launch plants. The slow-speed I. B. generators range in capacity from three-fourths kilowatt to 4½ kilowatts; the moderate-speed from 1½ kilowatts to 7½ kilowatts. All are wound for 125, 250 and 500 volts.

Simple Measuring Instruments.

The cut shows the general appearance of a line of low-priced ammeters and voltmeters made by the Cherry Electric Works of 25 and 27 Third avenue, New York. Each instrument reads to 10 amperes or 10 volts. These instruments are so inexpensive that they may be thought toys, but the manufacturers declare that they are practical instruments, scientifically constructed, and useful, as far as available, to the experienced electrician as well as to the student and amateur. They are furnished in hardwood cases and are of attractive appearance.

Indiana Mutual Telephone Association.

The annual meeting of the Indiana Mutual Telephone association, which was held at the Bates House, Indianapolis, January 19th, confirmed the impression that the independent movement is gaining ground daily, and is making great strides, particularly in that state. The morning session was in the nature of an "experience meeting," when managers of different exchanges told of the progress they were making and how they met competition. E. H. Andress of Lafayette, president of the association, declared that the independent telephone business throughout the state was on the increase, both in the number of subscribers to older exchanges, and in the number of new exchanges which were being put in. He said that in the beginning the home companies were regarded by competitors as short-lived, but the independent organizations had now become an important factor, and were really outgrowing the Central Union company in strength. This showing indicated that home companies should continue in the thick of the fight. It was the experience of all that where a home company and the Central Union are at war the people were inclined to the home organization.

George W. Beers of the Home Telephone company of Fort Wayne reported that that company had 1,400 subscribers and charged a rental of $36 a year for telephones in business houses and $24 for those in residences. Where a subscriber had both, the rate was $48 a year for the two. He said that the company had 700 miles of wire reaching other towns in Indiana and Ohio. This brought up the question of establishing long-distance service between independent companies. It was stated that many home companies had their local exchanges connected with smaller towns nearby, and this kind of service was becoming more common every day, and it is now reaching the point where the association expects to connect all of the central stations, so that in time the whole state may be reached through the offices of home companies.

A committee was appointed a year ago to confer with similar committees of independent associations in Pennsylvania and Ohio. In its report it showed that the independent enterprises were carried on in these three states to a greater extent than in others, there being at present 250 independent exchanges, with more than 100,000 subscribers, and capital invested exceeding $5,000,000. The report said that the demand upon home companies is now for more extended long distance service. That this might be accomplished, it was stated that in the three states mentioned, Ohio, Pennsylvania and Indiana, organizations are forming. To further this work, committees from the three states had been appointed. That from Indiana consists of E. H. Andress, George W. Beers and Hugh Daugherty. The committees had conferred with the Western Union and Postal Telegraph companies, with the object of forming an alliance of some kind whereby the long-distance lines might be established. But the possibilities were so remote, the committee said, that about the only way to obtain the desired result was to incorporate the independent exchanges of the state into one company, with sufficient capital to build the connecting line. It was recommended in the committee's report that this movement be taken up at once and developed as rapidly as possible.

In the afternoon an executive session was held, and the following named officers were elected for the ensuing year: President, E. H. Andress of Lafayette; vice president, J. S. Stone of [illegible]; secretary and treasurer, A. E. Reynolds of Crawfordsville; assistant secretary, W. H. [illegible] of Bluffton; executive committee, E. H. Andress, J. S. Stone, A. E. Reynolds, George W. Beers of Fort Wayne, C. M. Zion of Lebanon, Elliott Shirt of Noblesville, A. E. [illegible] of Crawfordsville.

Southern Telephone Notes.

[Special [illegible] correspondence of the [illegible]]

The telephone [illegible] in Orlando, [illegible] some time ago [illegible]. There are 87 subscribers [illegible]. The system [illegible] a line to Winter Park, [illegible] miles distant, and the [illegible] which will, it is expected, in the near future be extended to Maitland, Altamonte and Sanford, the latter town being [illegible] miles from Orlando. The instruments of the Phoenix Interior Telephone company are used in this system.

J. A. Sutton has resigned as manager of the Bell telephone office at Winston, N. C., and his successor has not as yet been appointed.

A resolution has been introduced in the Norfolk (Va.) Council asking the members of the Legislature from Norfolk to support the bill permitting that city to regulate telephone tolls.

A telephone line will soon be built between Raleigh and Chapel Hill, N. C.

A charter has been granted to the Lexington (Va.) Telephone company, recently organized with a capital stock of $5,000.

The Rockbridge, Alum, Longdale and Lexington Telephone company has been granted a charter, with a capital stock of $5,000.

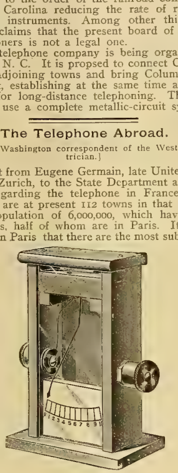
The Southern Bell Telephone company has filed objections to the order of the railroad commission in North Carolina reducing the rate of rental of telephone instruments. Among other things the company claims that the present board of railroad commissioners is not a legal one.

A new telephone company is being organized in Charlotte, N. C. It is propsed to connect Charlotte with the adjoining towns and bring Columbia into the circuit, establishing at the same time a rate of 15 cents for long-distance telephoning. The company will use a complete metallic-circuit system.

The Telephone Abroad.

[From the Washington correspondent of the Western Electrician.]

A report from Eugene Germain, late United States consul at Zurich, to the State Department at Washington, regarding the telephone in France, shows that there are at present 112 towns in that country, with a population of 6,000,000, which have 18,191 subscribers, half of whom are in Paris. It is not, however, in Paris that there are the most subscribers



SIMPLE MEASURING INSTRUMENTS.

in proportion to the number of inhabitants, for at Cannes the proportions is 1 to 120; 1 in 198 at Fourmies; 1 in 215 in Mentone, and 1 in 222 at Tourcoing, as against 1 in 253 in Paris. In France the telephone is little used in comparison with neighboring countries, like Germany and Switzerland, for while the number of communications in France last year was only 74,000,000, the total for Germany, excluding Bavaria and Wurtemburg, was over 424,000,000. Switzerland, with a population barely a tenth of that of France, had at the end of last year over 1,000 miles of telephone lines, with 29,533 subscribers and about 15,000,000 communications.

While the cost of the telephone in Switzerland is more than covered by the receipts, the conditions are different in France, although the subscription price is much higher than in the other countries, being $80 per annum in Paris, and from $40 to $60 in provincial towns, to say nothing of each subscriber having to contribute toward getting into the system. In Switzerland, in addition to the charge of getting an instrument put in and connected, the charge is $80 per annum, and five centimes (one cent) for each conversation of three minutes' duration. The government of Switzerland operates the telephone system.

Telephone News from the Northwest.

[From the Minneapolis correspondent of the Western Electrician.]

At the recent annual meeting of the Mutual Telephone company of Des Moines, Ia., there were reported in operation 950 instruments, and the plant represented an expenditure of $53,000. The receipts for the next year were estimated at $23,000 and the expenses $12,000.

The council of Bloomfield, Ia., has granted a franchise for a telephone exchange. It will have to be voted on by the people before it becomes effective.

The Wisconsin Telephone company is an applicant for a franchise at Marshfield, Wis.

The council of La Crosse, Wis., recently tested a police telephone system manufactured by the American Electric Telephone company. It consists of an automatic device, with an arrangement by which a red light can be shown at the box to notify the officer that he is wanted in case there is a telephone call to headquarters requesting an officer. This [illegible] great deal of time and increases the efficiency of the force. It is said if the city of La Crosse puts the system in it will be the first city in the country.

The council of Denison, Ia., recently granted the Iowa Telephone company a franchise in accordance with a vote of the people. But the mayor is dissatisfied with the rates proposed by the company and wants the council to pass on them. The mayor will explain the rates prevailing in other towns, and is prepared to make a strong case against the company.

The people of the town of Lincoln, near Alma, Wis., want telephone connection between Alma and Cream P. O. From there the farmers expect to build a line of their own up the valley.

The Northwestern Telephone Exchange company is preparing to connect the Grand Forks, N. D., exchange with the Crookston, Minn., system.

A. T. Presson will establish a telephone exchange in New Richmond, Wis., in the spring.

The Seattle, Wash., Telephone company's list has now reached 1,500 subscribers.

Telephone War in Iowa.

According to a dispatch from Des Moines, Iowa, January 26th, the Mutual Telephone company, which is the Bell Telephone company's rival there, claims that the big express companies will discontinue the Bell service. The war now being waged in Iowa is said to be the hardest ever experienced by the Bell company. A toll line with a metallic circuit will be built to Oskaloosa early in the spring, and will connect with the Mutual exchanges in Dubuque and other cities in the eastern part of the state.

American Street Railway Association.

[Special dispatch to the Western Electrician.]

Boston, January 25.—The executive committee of the American Street Railway association met here to-day. Considerable business of a routine character was transacted and the plans for the next meeting examined. The time and place of the annual convention of the association were fixed. Mechanics' Hall, Boston, was selected as the place and September 6th the date for the meeting.

CORRESPONDENCE.

New York Notes.

New York, January 25.—The contract for the electrical equipment of the Manhattan elevated railroad system doesn't seem to be getting signed with the glad precipitancy that one might suppose. The directors have taken no action in the matter, so far as known, and Major J. W. Hinkley, president of the Walker company, now claims that officials of his company have been misquoted when they have been made to say that contracts with the Manhattan company were as good as signed. This was not the fact, he said. No contracts had even been drawn up. Major Hinkley proceeded to explain that in such an important matter as the equipment of the elevated road with electricity much consideration was necessary, and that the directors of the road would be certain to go into every possible detail, a programme involving the consumption of much time and labor before they would be ready to take decisive steps. The Walker company was working on its plans and specifications, he said, but it would take some time to finish them before they could be presented to the directors of the Manhattan company; how long, Major Hinkley could not say. President Gould of the Manhattan company has written to the Rapid Transit Commission to state what extensions his company will build, if allowed to do so, but he does not say a word about electricity. In answer the commissioners ask for more information, but are as dumb as oysters about the electrical equipment. Some people profess to think that the Manhattan company is not sincere in its promises—and there you are.

The subject announced for the meeting of the Institute to-morrow night is a discussion of the "Standardizing of Generators, Motors and Transformers." It is proposed to discuss the question from the technical point of view, in its relations to the designer, the manufacturer, the consulting engineer and the user. Consideration will also be given to the policy on the part of the Institute in undertaking to bring about such a result.

February 10th is the date now set for the completion of all work connected with the trolley-car service on the Brooklyn bridge. The cars crossing the bridge will carry a sign on the dashboard reading: "Direct to New York."

Assemblyman Cain of Brooklyn has introduced in the Legislature the bill of last year providing for a commission to consist of the attorney-general, the controller and the state engineer to regulate telephone charges. The rate in New York city is to be $85 a year, and from this it runs down to $27 a year in places of less than 8,000 inhabitants.

At the annual meeting of the American Society of Civil Engineers, held in this city last week, the election of officers resulted as follows: President, Alphonse Fteley, New York; vice-presidents, Edward P. North, New York, and Frederic P. Stearns, Boston; treasurer, John Thompson, New York; directors, S. L. F. Deyo of New York, John Kennedy of Montreal, Henry Manley of Boston, John J. McVean of Grand Rapids, George Y. Wisner

of Detroit and Charles C. Schneider of Pencoyd, Pa.

Brooklyn's first experiment with an underground trolley railway will probably be on the little road running on Montague street, from Court street to Wall street ferry. This is at present operated by cable, but the Brooklyn Heights company, in whose system it is included, contemplates an early change to the underground trolley. The change will cost, it is said, about $100,000. M. S.

PERSONAL

Henry Charles Fischer is about to resign the controllership of the Central Telegraph Office, in London, which he has occupied ever since the telegraphs were taken over by the state. He is a German by birth, but has lived in London for 40 years.

Frank A. Rogers has resigned the position of general manager of the Card Electric company of Mansfield, O. Mr. Rogers was with the Brush company for a period of 14 years and afterward with the Short Electric Railway company. He has a wide acquaintance in the electrical trade.

Cyrus Robinson, formerly with the Ridgway (Pa.) Dynamo and Engine company, is now the engineer and vice-president of the Portland Manufacturing company of Portland, Oregon. This company intends to manufacture electrical equipment for mines —a branch with which Mr. Robinson is especially familiar.

W. R. Garton has severed his connection with the Central Electric company of Chicago and will soon open an office in this city. Mr. Garton, who was in charge of the railway department of the Central company for three years and a half, will hereafter devote his time to his personal interests as well as the representation of eastern manufacturers.

President Gibbs of the Marsden company, who was formerly president of the Electric Storage Battery company of Philadelphia, has been in Chicago several days to further the interests of the corporation he represents. He says the $1,000,000 required to equip new plants and provide working capital has been obtained. A trial of the Marsden cellulose as a packing for war vessels was recently made at Portsmouth, England, before government officials, and it is claimed that it proved a great success.

Mr. F. S. Terry has removed, with his family, to Newark, N. J., where he will take an important position with the Weston Electrical Instrument company. For 14 years Mr. Terry has been one of the leading figures among the electrical business men of Chicago. He has seen a remarkable expansion of this industry in this city and has been active in every concerted movement of electrical men. As president of the Electrical Supply company and later the Ansonia Electric company until 1893, and as manager of the Sunbeam Lamp company after that date, Mr. Terry became well known to members of the electrical fraternity all over the country. He was one of the organizers of the National Electric Light association, and for several years he was treasurer of the old Chicago Electric Club. His shrewd judgment and business experience have always been recognized by his associates and friends in the West, who, while wishing him success in his new undertaking, will still regret his departure from Chicago. However, Mr. Terry will still retain an interest in the Sunbeam company, so that his business ties with the western metropolis will not be entirely severed.

ELECTRIC LIGHTING.

A strong effort is being made to have Orlando, Florida, lighted by electricity, and it seems probable that within a short time such a plant for this purpose may be erected by private enterprise.

The contract for the wiring, tubing and switchboard for the United States postoffice building at Washington, D. C., has been awarded to the Southern Electric company of Baltimore, Md., at $20,650.

The superintendent of city lighting at Richmond, Va., advertised for bids for lighting the city electrically, but so far has not received any proposals, and the time has accordingly been extended to February 1st.

ELECTRIC RAILWAYS.

A London paper states that the work on the Jungfrau railway is being pushed forward in spite of the severe weather which prevails in Switzerland. In Lauterbrunnen water power to the extent of 2,400 horse power is now available, and half of this is being utilized for the motors employed in the boring of the Eiger shaft or tunnel.

It is stated that Judge Wheeler of the United States Circuit Court of New York has handed down a decision sustaining the validity of the electric railway motor-suspension patent controlled by the General Electric and Westinghouse companies and ordering an injunction against the Union Railway company of that city and the Walker company of Cleveland.

The Congressional bill looking to the extension of the Lexington and Soldiers' Home railroad and its amalgamation with the Belt Line railroad, and the purchase or lease of the Maryland and Washington railroad has been reported back to the Senate favorably. The bill for the extension of the lines of the Capital Traction company has been reported back with some slight amendments as to the route to be traversed in the line of extension.

It is reported in Appleton, Wis., that the Chicago and Northwestern Railway company has secured an option on the line of the Appleton Electric Street Railway company. A. L. Smith, president of the local railway company, is said to have admitted the truth of the report, but denies the further story that the Northwestern is planning to compete with the Inter-urban Electric company, which now has a line in the Fox River valley. The line will be 65 miles in length, if built, and will include the following-named cities as routes: Depere, Wrightstown, South Kaukauna, Appleton, Neenah, Menasha, Oshkosh, and Fond du Lac, besides many small manufacturing villages along the Fox River.

The war that has been waged by the Brunswick Traction company against the Philadelphia Traction company for the right of way through the towns of Somerville and Raritan resulted in a victory for the Philadelphia company, to which a franchise was granted January 24th by the Somerville town commissioners to build its road through the town. The road will cut out the Brunswick company, which has already built seven miles of its proposed route connecting the towns of Raritan and Somerville with New Brunswick. The company is required to deposit $17,000 as a guarantee fund. The company will pay a yearly rental to the town for 10 years averaging $250 per year, after which the town will receive three per cent. of the gross receipts of the company.

Earnings of the National Railway company of St. Louis for the year 1897 were 8.45 per cent. applicable to the 6 per cent. bonds of the company. These earnings stand against 9.22 in 1896, 8.05 in 1895, 8.85 in 1894, and 9.08 in 1893. The annual meeting of the company was held in Chicago on January 25th. While the properties are located in St. Louis, the controlling interest in the stock is in Chicago. The election of directors resulted in the choice of W. T. Baker, E. Buckingham, T. J. Lefens, G. T. Smith, D. G. Hamilton, E. G. Foreman and C. L. Raymond. The past business of the company was altogether satisfactory to the shareholders. The company pays six per cent. dividends. The business of the year ran about as with other street railroad corporations, that is, the last four months were good and the first eight relatively poor. The current operating expenses were 59.9 per cent. of the gross receipts—61.6 per cent. for the cable lines and 59.1 for the electric lines. The total car-miles run was 12,010,683, and the total passengers carried, 29,350,513. The total cost of carrying each passenger was .5 cents. By cable, 4.22 cents; by electricity, 4.27 cents. The gross receipts were $1,467,975.78.

ELECTRICAL SECURITIES.

Columbia Construction company stockholders are to be given the privilege of subscribing for the $4,000,000 Chicago Northwestern "L" bonds it was recently decided to issue.

The New Orleans Traction company reports gross earnings for December of $107,026, a decrease of $1,995 as compared with the same month of the previous year, and net $45,399, an increase of $8,457. For the year ended December 31st the gross earnings were $1,237,250, a decrease of $85,756 as compared with the corresponding period of the previous year, and net $399,869, decrease of $184,284.

MISCELLANEOUS.

The State Department has been informed that the project of establishing an electric lighting plant in Belize, British Honduras, has been disapproved by the secretary for the colonies in London.

The contract for the motive power for the electric light and power plant of the United States postoffice building at Washington, D. C., has been awarded to the McKay-Howard Engineering company of Baltimore, Md., at $17,585. The contract calls for four Buckeye tandem compound engines and four Three-Bay dynamos.

The January meeting of the Engineering Association of the South was held on January 13th at the residence of Mr. Hunter McDonald in Nashville, Tenn. President Walker occupied the chair, and several new members were elected. Dr. William L. Dudley of Vanderbilt University delivered an address on "Improved Methods of Coke Making."

TRADE NEWS.

The Western Electric company has placed in stock a large supply of Victor split insulators. This insulator makes an effectual break insulator for overhead line wires and for guy wires.

There seems to be no limit to the reduction in the price of automatic rheostats. A few years ago an automatic rheostat for a one horse power motor was considered cheap at $25. Last year the price was reduced to $5, and now comes a reduction to $4.50 by a leading manufacturer of rheostats. It may well be doubted whether there is a reasonable manufacturing profit in making such an article at such a price.

Charles Martin of Detroit claims to have built the largest independent-telephone switchboard in the world. Mr. Martin, who has succeeded to the business of W. R. Cole of 14 and 16 Macomb street, Detroit, is prepared to furnish complete equipments for independent exchanges.

Lieut. E. J. Spencer, the western agent of the Safety Insulated Wire and Cable company, has just closed a contract by which his company supplies all the electrical conductors—inside and outside wire and underground cable—for the Trans-Mississippi and International Exposition at Omaha. Lieut. Spencer's office is at 24 Laclede building, St. Louis.

Under date of January 17th the New York Tribune printed this dispatch from Schenectady: "The General Electric company is preparing plans for one of the largest iron foundries ever constructed in this country, to be built in this city. It will be 500 feet long and 130 feet wide. The officials of the company also announce that they are considering the advisability of removing the branch lamp works at Harrison, N. J., to this city. The Harrison works new employ about 1,200 hands, but if removed to this city the works will be enlarged and the force increased to 1,800."

The Ames Iron Works of Oswego, N. Y., announce that they have opened a Chicago office, at 1452 Monadnock building, in charge of Mr. George K. Orrell. About two years ago this concern gave up its Chicago office, and in fact quite a number of its distributing offices in the West, on account of the fact that business conditions did not warrant keeping them open. But because of the decided improvement in business, and the large amount of inquiries for the company's product, it has decided to open this office again at once. The Ames automatic and throttle engines need no introduction, their points of excellence are thoroughly understood by the electrical trade. The Ames Iron Works also manufacture upright and horizontal boilers of any size.

Engine users will undoubtedly be pleased as well as interested by the news that the Armington & Sims company of Providence, R. I., has purchased the entire plant of the old Armington & Sims Engine company, and will continue the manufacture of this celebrated and standard make of steam engines. The officers of the new corporation are: President, Julius Palmer; secretary and treasurer, James C. Church; general manager, Fred N. Bushnell. The board of directors is one of the strongest, financially, that is identified with the business in Providence. The company is capitalized for $150,000, paid in full. Julius Palmer, its president, is one of the leading business men of Providence, being the president of the Old National Bank of that city. Fred N. Bushnell, the general manager, is peculiarly well fitted for this position. He has a technical education in mechanics, together with the practical experience of passing from tending a lathe in the shop to superintendent of large manufacturing installations. He has also acted in the capacity of advising engineer.

In announcing two lines of transformers in its January bulletin, the Wagner Electric Manufacturing company of St. Louis makes this interesting statement: "The manufacturers of transformers has two distinct classes of central stations to supply—those furnishing an all-day service and those furnishing only a night service. The former requires an equipment of transformers with a high all-day efficiency, while the latter can operate quite satisfactorily with transformers somewhat lower in efficiency. To meet the demands of both classes, this company will hereafter build two distinct lines of transformers in all sizes up and including the 150 lighter—the type G, extra high efficiency, and the type F, slightly lower in efficiency. The type G, which is fully described in our bulletin No. 9, is designed to afford a degree of economy in transformer service in excess of that hereto possible with transformers built by this or any other company. It furthermore embodies many decided mechanical improvements over all other transformers in the market. In bringing out this line it was our desire to produce something far superior to anything our competitors had to offer, or would be likely to have for some years to come, and the results achieved up to the present time indicate that our full expectations have been realized. We appreciate, however, that not every transformer buyer can install the high efficiency line, nor do we recommend this line for night-service stations, and to provide an improved type for his trade the type F has been brought out. This type will at once supersede the type D, which has been our standard for several years past. The type F corresponds in all electrical considerations to the type D, differing from the type D only in that it embodies all the mechanical improvements of the type G."

BUSINESS.

The Upton midget long-burning arc lamp is already a very popular specialty. The small size, light weight and tasteful appearance of the lamp make it a very desirable arc lamp for inside work, while its positive and steady action and general reliability make it a popular lamp for all places where a low

burning arc lamp is required. The Electric Appliance company, Chicago, will be glad to send its latest circular on this specialty on application.

The Deane pumping machinery is so well known that every engineer or power-station manager should have the company's catalogue. The latest issue and the supplements may be had by addressing the Deane Steam Pump company of Holyoke, Mass.

The Electric Storage Battery company of Philadelphia has issued a new catalogue which sets forth the advantages of employing accumulators, illustrating several prominent plants, and gives complete tables of the dimensions, capacity, weight, cost, etc., of each type of element.

The Eddy Electric Manufacturing company of Windsor, Conn., has been enjoying a prosperous season of late, having been obliged to run its large manufacturing plant 16 hours per day for a long time, in order to keep abreast of the orders which have been pouring in upon it. The Eddy motor and dynamo was one of the first manufactured, and the type is very well known. General Manager M. E. Baird is at present on the Pacific coast, where he has important business.

The Jewell Belting company of Hartford, Conn., has been selling some very large belts of late to central stations and isolated power plants. It reports that the outlook for business has not been as good for a long time as it is at present. Secretary C. E. Newton has been for some time at Knoxville, Tenn., where the large tannery interests of this concern are located. Mr. Newton is arranging for large additions to the tannery, in order to meet the increase in trade which has been apparent in their business of late.

The Western Electric company's 12-inch desk fan for 1898 is said to require less current to operate it than is used by a 16 candle power incandescent lamp. This economy over fan motors of the past three or four years shows a great improvement in mechanical detail as well as electrical design. The Western Electric company will soon issue a 32-page fan-motor catalogue, listing direct and alternating-current fan motors, also battery fan motors; and those interested in fan motors will do well to write for a copy of this pamphlet.

The Monarch Manufacturing company of Waterbury, Conn., finds that the call for its engine stop and split-loom device has become so great that it is considering the advisability of locating an office at Chicago to handle its trade for that section of the country. The device has particular advantages for use in electric light and power stations. The testimonials whic hthe concern shows in regard to this apparatus are numerous and from some of the leading manufacturers of the country. The company's new catalogue has been issued, and gives a very good description of this product.

The Hart & Hegeman Manufacturing company of Hartford, Conn., reports that the call for the Hart flush switches has been so large of late that it has compelled it to add materially to its force, in order to keep up with orders. The Hart switch has a porcelain base that surrounds all mechanism and contacts. The metal ears are provided for attachment to the wall or box, and it has the great advantage that all connections are made in front, thus avoiding the necessity of leaving slack wire behind the switch. It is adapted to fit narrow recesses, and will fit boxes usually provided for push patent switches.

The Pelton Water Wheel company reports a large run of business for the last two months of 1897. Among the more important shipments may be mentioned the following: Wheels, governors and accessories covering a 2,000 horse power plant for the Rafael paper mills, Mexico; six wheels for various other locations in Mexico; a 1,200 horse power wheel, with governors and accessories, for an electric transmission plant for Petropolis, Brazil, this being a duplicate of the former plant; an electric power transmission plant for Frujillo, Brazil; seven wheels with governors, pipe lines and accessories, to operate tea and coffee plantations in Java; three wheels for the Ruby mines in India; two 500 horse power wheels for operating mills in Tasmania, Australia; three 1,000 horse power wheels, with governors and accessories, direct-connected to Stanley generators, for the Yuba Power company, Marysville, Cal.; one 200 horse power wheel for operating the mill of the Dexter Gold Mining company, Tuscarora, Nevada; nine wheels for various mining operations in California. A large number of orders is in hand, making the outlook for the present year very encouraging.

ILLUSTRATED ELECTRICAL PATENT RECORD.

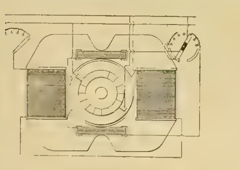
Issued January 18, 1898.

597,418. Regulation of Dynamo-electric Machinery. Frederic A. Johnson, Binghamton, N. Y. Application filed April 14, 1897.

The method of producing and varying the magnetic flux in a dynamo-electric machine consists in creating a magnetomotive force in a magnetic circuit composed at one or more points of several branches, generating, in one or more of the branches, a second magnetomotive force, and varying the second magnetomotive force at will to vary the total flux through the machine, while maintaining a strong flux through those branches of the magnetic circuit which furnish the field for the coils under commutation.

597,419. Regulation of Dynamo-electric Machinery. Frederic A. Johnson, Binghamton, N. Y. Application filed April 24, 1897.

A polar face excited from two separate necks, coils on the necks for furnishing the excitation, and switches for separately varying the currents in the coils.



NO. 597,418.

597,424. Electric Arc Lamp. Adolphe Mougin, Paris, France. Application filed February 13, 1897. Patented in France February 11, 1895; in Germany February 28, 1895; in Belgium August 7, 1895, and in England August 23, 1895.

Means are provided for obtaining the automatic formation of a short-circuit, whereby the motor for feeding the carbons, which is situated in the circuit of derivation, is instantly stopped when the carbons are used up, the same comprising a rod and spring insulated from the lamp and connected with the brushes of the motor, the rod upon being raised by the lower carbon-holder, as soon as the latter reaches the limit of its upward movement, coming in contact with the spring and causing the current, instead of passing through the motor to reach the lamp, to pass through the circuit of smaller resistance closed by the contact of the rod with the spring.

597,432. Electric Car Brake. Constant F. de Redon, New York, N. Y. Application filed September 22, 1896.

The magnet carried by the car and at each side of the latter is combined with a pivoted brake arm carried from the end of each magnet and turning inward in line with the length of the magnet, and a brake shoe for contact with the rail carried by each of the brake arm.

597,433. Electro-magnetic Railway Car Brake. Constant F. de Redon, New York, N. Y. Application filed April 22, 1897.

There is the electro-magnet at each side of the car, the pole piece extending from one end thereof and the brake arm pivotally secured to the pole piece, combined with the brake shoe carried by the brake arm and the pole piece extending from the other end of the magnet toward the brake arm.

597,467. Trolley Car [illegible] Hall, New York, N. [illegible] Application [illegible] February 1, 1897.

The attachment [illegible] provided with a circular head [illegible] to either end of the car, a shaft [illegible] through the head, a revoluble disk mounted [illegible] to the head, a spool mounted on the shaft [illegible] springs mounted at each side of the disk, one end of one of the springs being secured to the spool and the other to the disk, and one end of the other spring being secured to the disk and the other to the head [illegible] devices for locking the disks to the head so as to prevent the revolution thereof, and devices connected with the spool for releasing the locking devices and operatively engaging the disk, and the disk and the spool being adapted to revolve in the same direction.

597,472. Electro-mechanical Switch-operating Mechanism. Charles W. Squires, Springfield, Mass. Application filed April 9, 1897.

A device is employed for throwing the tongue, a car-wheel operated lever, a shiftable pawl to have a thrust imparted thereto by the lever and to shift the switch-throwing device, an electro-magnet and its armature engaged with the pawl, a catch device for automatically engaging the lever when depressed, and a part through which the catch is engaged with the armature.

597,476. Electric Furnace. Thomas L. Willson, New York, N. Y. Application filed November 15, 1895.

The furnace chamber has a hearth, an upright movable carbon pencil, an upright chamber adapted to wholly inclose the pencil in its movements, and a feeding flue discharging into the lower part of the upright chamber at one side thereof, whereby material dumped through the flue falls into the furnace chamber against the side of the carbon pencil, and an outlet flue leading from the furnace.

597,516. Electric Trolley Device. Gustaf Valley, Johnstown, Pa. Application filed March 8, 1897.

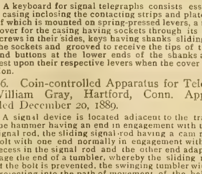
A trolley comprising a suitable base portion and a tilting standard pivoted thereto and upheld by yielding members is arranged with a pair of arms pivoted to the standard, a second pair of arms pivoted to the base portion, a contact-carrying arm pivoted to the upper ends of both of the pairs of arms, and compression springs secured between the pairs of arms and adapted to impart upward pressure to the contact-carrying arm.

597,536. Signal Telegraph. Claudius V. Boughton, Buffalo, N. Y. Application filed December 19, 1895.

A keyboard for signal telegraphs consists essentially of a casing inclosing the contacting strips and plates, one set of which is mounted on spring-pressed levers, a removable cover for the casing having sockets through its body with screws in their sides, keys having shanks sliding through the sockets and grooved to receive the tips of the screws, and buttons at the lower ends of the shanks adapted to rest upon their respective levers when the cover is in position.

597,556. Coin-controlled Apparatus for Telephones. William Gray, Hartford, Conn. Application filed December 20, 1889.

A signal device is located adjacent to the transmitter, the hammer having an end in engagement with the sliding signal rod, the sliding signal-rod having a cam recess, the bolt with one end normally in engagement with the cam recess in the signal rod and the other end adapted to engage the end of a tumbler, whereby the sliding movement of the bolt is prevented, the swinging tumbler with one end projecting into the path of movement of the bolt and the other projecting into a coin-channel, and the coin-channel carrier governor mounted in the frame, a brake-lever fulcrumed to the support and actuated by a spring to bear on the governor, and a link connecting the free portion of the frame and the lever to release the latter to the action of the spring.



NO. 597,432.

597,587. Telegraphic Signal. James Nicolson, Buenos Ayres, Argentina. Application filed February 26, 1897.

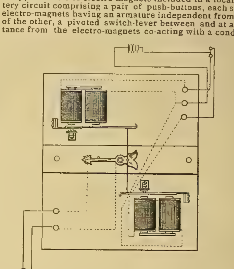
Telegraph signals having an uneven number of elementary motions for the vowels and accented vowels of the alphabet, and an even number of such motions for the consonants of the alphabet.

597,601. Electric Arc Lamp. Emanuel Blaser, California, Mo. Application filed July 15, 1897.

An improved arc lamp, including a support, a frame pivoted to swing vertically therein, a carbon carrier and a

597,642. Electric Switch. Everett M. French, Stoughton, Mass. Application filed September 16, 1897.

Claim is made for the combination with a suitable base of opposite sets of electro-magnets included in a local battery circuit comprising a pair of push-buttons, each set of electro-magnets having an armature independent from that of the other, a pivoted switch-lever between and at a distance from the electro-magnets co-acting with a conducting contact, and a main-line circuit including illuminating devices connected to the pivoted switch-lever and the conducting contact, and a cord extending in opposite directions from the end of the switch-lever farthest from the conducting contact and attached to the free ends of the opposite armatures, whereby the illuminating devices in the main-line circuit may be controlled by the push-buttons in the local battery circuit for illuminating and extinguishing purposes without carrying the heavy main-line wires into a building.



NO. 597,642.

597,650. Electric Lock and System of Electric Locking for Securing Additional Safety in Railroad Signaling. James F. W. Morris and George Mumford, London, England. Application filed October 16, 1896.

In a signal-receiving instrument for use on railways, the combination of a locking bolt for the handle of the instrument, a catch for the bolt, an electro-magnet excited by a current from an adjacent station for releasing the catch, and a gravity latch for supporting the catch when so released.

597,680. Keyboard Telegraphic Transmitter. Samuel Price, Paterson, N. J. Application filed June 17, 1897.

A keyboard transmitter is provided with means for transmitting electrical impulses in the nature of a Morse code over a telegraph line, in combination with propelling mechanism adapted to enable the operator to store up the prepared record in advance of its transmission and at any desired speed, together with additional propelling mechanism for causing the transmitted impulses to be sent at a substantially constant speed.

597,693. Trolley Wheel. Harry B. Sawyer, Chicago, Ill. Application filed June 19, 1897.

The removable bracket for trolley poles described consists of arms secured to the socket, in combination with a sleeve designed to be attached to the trolley pole and having upon its upper end an annular collar, and having secured near its lower end an adjustable collar in combination with a withdrawable spring-controlled stop-pin.

Western Electrician.
EVERY SATURDAY.
Vol. XXII. CHICAGO, FEBRUARY 5, 1898. No. 6

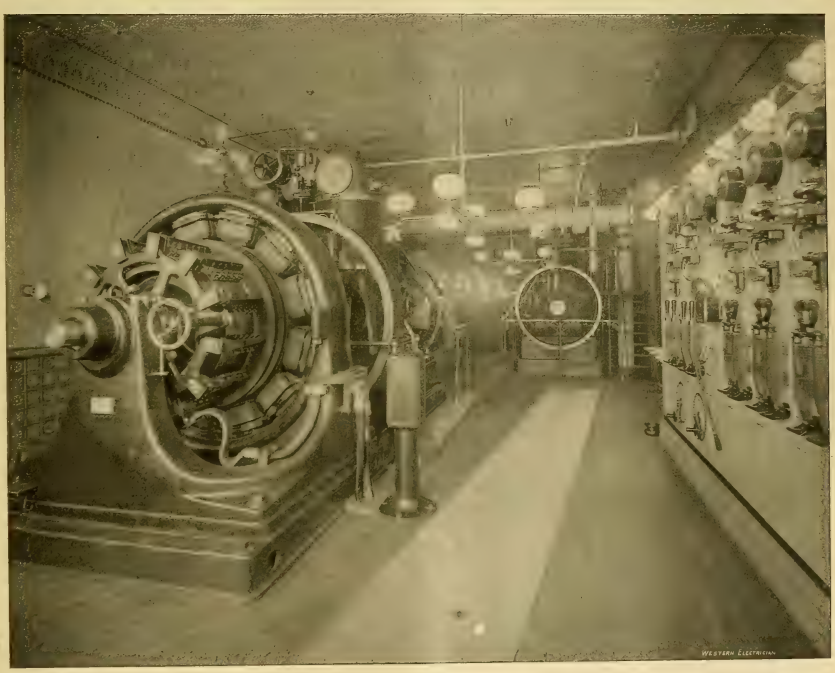
Modern Direct-connected Isolated Plant.

It is only when one compares the compact direct-connected isolated plants of the present day with the installations that preceded them and were operated under similar conditions that one fully appreciates the advancement that has been made in this class of work as well as in central-station practice. It is a noticeable fact that more attention is given to details nowadays, and that while economy may be practiced in the allotment of space for a generating plant, the arrangement and surroundings of the machines are much more favorable for efficiency in operation than formerly. An example that emphasizes these points is presented in the isolated plant of the Western Wheel Works of Chicago, which forms the subject of illustration on this page. This institution is one of the largest and most successful bicycle manufacturers in the country, and for the successful operation of these works modern methods and machinery are required. The present electrical plant has only recently been installed, but it has already demonstrated the wisdom of the management in the selection. It replaced an equipment that did excellent service for years, and which at the time was considered a fair example of the state of the art. The demand for larger capacity and modern design made the present plant necessary.

The original installation comprised two standard Mather dynamos driven by an Atlas engine belted to counter-shafting. This plant was illustrated in the Western Electrician, May 28, 1892, and reference to that issue indicates plainly the marked changes that have been made in this field. In place of separate dynamos and engines with counter-shafting and belting which was the accepted practice seven years ago, there are now direct-connected units occupying much less space and giving far higher efficiency.

As indicated in the picture on this page, the plant comprises two units. Westinghouse 125-volt generators of 275 kilowatts capacity, operated at 250 revolutions per minute, and Westinghouse compound engines with cylinders 18 and 30 inches in diameter and 16 inch stroke of piston are direct-connected by means of flexible spring coupling, forming the well-known Westinghouse Kodak type of connection. While the engines are designed for less than 400 horse power each, they have delivered as high as 500 horse power for weeks at a time without injury and with perfect success. The floor space occupied by each complete outfit is only 19 feet six inches long by seven feet 10 inches wide. The generators are compound wound for three per cent loss. The current is carried to the handsomely equipped switchboard of Italian marble shown in the cut, which contains two generator panels of 2,200-ampere capacity and five feeder panels of 1,500-ampere capacity. The current is distributed through the works and is used for lighting and operating motors. There are 3,000 lights connected up at the present time and 21 motors, including one 80 horse power, two 65, one 50, one 40, two 35, three 30, two 25, three 20, four 10 and two 5. The machines which formerly supplied current for light and power to the entire factory are now utilized as motors for driving shafting and form a comparatively small part of the present equipment.

The apparatus for the new plant and the engineering and construction work in connection with the equipment were furnished by the Chicago offices of the Westinghouse Electric and Manufacturing company and Westinghouse, Church, Kerr & Co. George D. Van Tassel, the engineer for the Western Wheel works, who has been in charge of the electrical plant since it was first installed, is very well pleased with the present equipment.



MODERN DIRECT-CONNECTED ISOLATED PLANT

Commissioner of Patents.

Charles H. Duell of Syracuse, the newly-appointed commissioner of patents, is vice-president of the Peckham Truck company of New York. Mr. Hatch of that company is quoted by the New York Tribune as speaking of his friend in these terms: "I have known Mr. Duell for 30 years, but almost wholly in a business way. He is a son of R. Holland Duell, who was a very prominent man in his day. R. Holland Duell was a member of Congress for three terms and was appointed commissioner of patents in September, 1875, and served as such until December, 1876, when he resigned. You can see readily from where Charles H. Duell derived his tendency toward the patent side of law. After his graduation from Hamilton College he came to this city and entered a law office. After being admitted to the bar he had an office for a number of years at No. 229 Broadway, but at length his inclination, as he had married a Syracuse woman, and the feeling that he could do better in a section of the state where he possessed greater family influence, led him to remove to Syracuse, where he has since remained. I regard him as easily at the head of the patent lawyers of the western part of the state, and one of the very best in the country. He entered into partnership with us about eight years ago on the patent side of our business. Mr. Duell has been married some 20 years and has children."

Efficiency Tests on the Englewood and Chicago Electric Storage-battery Road.

Since June 20, 1897, Chicago's storage-battery road has been attracting widespread attention by its successful operation. During the summer over 20 motor cars were operated, often with trailers, and thousands of people were carried each day between Sixty-third street and the cemeteries at Morgan Park, as well as to Blue Island. When the winter schedule of nine cars was instituted, it was decided by Mr. G. Herbert Condict, then general manager, to make a complete test of the road and of its model power house, to determine the most economical methods of operation. Three tests of the power house were conducted under actual operating conditions, no effort being made to obtain results better than might be expected in everyday service. As there has been no small amount of inquiry in regard to the cost of operating a storage-battery system, Mr. Condict has been prevailed upon to make the figures public, and the following abstract has been made of the very complete report of the work.

The tests were put in charge of Mr. George A. Damon, who was ably assisted by Prof. T. P. Sayler and a corps of students from the Armour Institute of Technology.

The details of the equipment of this road have been described completely in the Western Electrician of August 7, 1897, and the Engineering News of January 6, 1898.

I. Power-house Tests.

The boiler plant consists of three Heine water-tube boilers rated at 200 boiler horse power each, fitted with Roney mechanical stokers. The engines are triple expansion, condensing, of the Willans central-valve type, and were made by the M. C. Bullock Manufacturing company of Chicago. The plant at present contains two of these engines. Each engine has two lines of tandem cylinders, and is rated at 200 horse power at a speed of 380 revolutions per minute.

The engines are directly connected by means of the "Arnold system" to four six-pole, shunt-wound Walker power generators, rated at 190 kilowatts each when running at 380 turns per minute. In the system used to connect the generators each dynamo armature is carried on a hollow quill, through which extends a solid shaft with suitable mechanical connections so arranged at present that either engine can operate any number of the four generators at will. The generators are designed to deliver their rated output at a voltage varying between 160 and 190 volts.

Each engine exhausts into a jet condenser, made by the Worthington company, from which the condensed steam and heated injection water is raised by means of the air pump about 35 feet to the top of a Worthington cooling tower, in the bottom of which it collects ready to be again used in the condenser. The blast of air which evaporates a small part of the water, and the cool that remaining in the tower, is furnished by a fan operated by a Siemens & Halske motor taking current from behind the switchboard. The water lost by evaporation and otherwise in the system is replaced from either of two sources; the city mains or an artesian well, the latter fitted with a direct-plunger type pump.

The boiler-feed pumps are of the duplex compound type, made by the Worthington company, and ordinarily take their supply from the well of the cooling tower, pumping it through a closed feed-water heater in the exhaust line of the pumps and thence through the economizer to a common feed-water header above the boilers.

The hot flue gases from the boilers pass from the uptakes into a brick smoke flue extending the entire length of the boiler room. In a brickwork extension of this flue, located between the power house proper and the stack, is installed a Green economizer with passages and dampers so arranged that the economizer pipes may be made to intercept the hot flue gases. The economizer consists of eight rows of 24 pipes each, making a total of 192 pipes.

The stack is self-supporting and is constructed of steel. It is 150 feet high and seven feet in diameter.

Lack of space will not permit giving a complete description of the scheme of the tests nor of the precautions adopted by Mr. Damon to secure accurate observations on the coal and water consumed, as well as the output of the engines and generators.

All scales, steam gauges, thermometers, indicator springs, electrical and other instruments used were either the standard apparatus of the Armour Institute or were carefully calibrated.

The first test was with the plant running with two boilers, two engines and three generators. The second test was with practically the same load carried by one boiler, one engine and two generators, while the last test was made under practically the same conditions as the second test, with the exception that the three-voltage method of charging the batteries was abandoned. In this test but one generator was used and the batteries were charged in successive sets, all at a common potential, the voltage being raised as the batteries became charged in such a way that the load upon the generator was kept nearly constant.

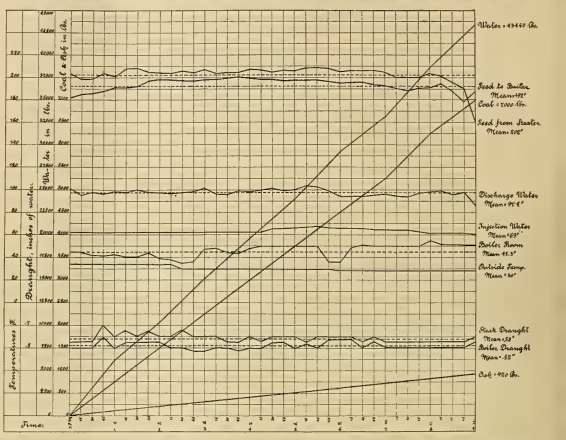


FIG. 1. EFFICIENCY TESTS OF THE ENGLEWOOD AND CHICAGO ELECTRIC STORAGE-BATTERY ROAD.—GRAPHICAL LOG OF BOILER TEST, NOVEMBER 26, 1897.

The coal used was from Fairmount, W. Va., and cost, delivered at the power house, $1.90 per ton. An average of five determinations of its calorific value by the Berthier method gave 10,145 British thermal units per pound. The average of six analyses gives the following result:

Moisture	6.326	per cent.
Volatiles and combustibles	32.903	"
Fixed carbon	48.126	"
Sulphur	2.700	"
Ash	10.030	"

Eight indicators were necessary to obtain the horse power developed by each engine. A typical record of one set of cards is shown by the following table:

Card No. 7—Taken 3:15 p. m. on November 26, 1897.

		M. E. P.	Horse Power.
High-pressure cylinder,	North Line	59.85	31.14
do.	South Line	71.2	37.16
Intermediate receiver,	North Line	15.6	6.96
do.	South Line	15.8	7.01
Intermediate cylinder,	North Line	21.8	28.19
do.	South Line	26.7	30.55
Low-pressure receiver,	North Line	5.85	6.25
do.	South Line	5.73	6.25
Low-pressure cylinder,	North Line	8.18	21.90
do.	South Line	8.81	26.81
Transfer chamber,	North Line	4.92	14 88
do.	South Line	5.12	16.46
Horse power,	North Line	112.45	
do.	South Line		120.27
Total horse power		232.72	
Revolutions per minute		373.3	
Gauge pressure		182.0	
Vacuum		26.5	
Kilowatt output		139.4	
Electrical horse power		186.9	
Efficiency		80 %	

Cards were taken every half hour during each test. The results of the cards taken during the test of November 26th are shown in the following table:

Time.	Card.	I. H. P.	B. H. P.	Efficiency per cent.
After test.	1	25.08	.....	Friction
After test.	2	32.36	.....	Friction
After test.	3	32.36	.....	Friction
3:15 p. m.	7	232.72	186.9	79.96
3:45	8	226.58	177.4	78.29
4:45	9	214.25	168.4	78.6
5:15	10	217.5	171.4	78.85
5:45	11	218.6	172.2	78.77
6:15	12	222.12	176.9	79.64
6:45	13	209.83	164.4	78.35
7:15	14	215.50	176.4	81.83
7:45	15	224.66	182.1	81.05
8:15	16	227.49	180.3	79.25
8:45	17	208.04	162.5	77.88
9:15	18	202.15	156.8	77.56
11:15	21	246.24	196.5	79.8
11:45	22	237.88	193.3	80.

Average indicated horse power, 217.
Average electrical horse power, 172.
Average all-day efficiency, 79.3 per cent.

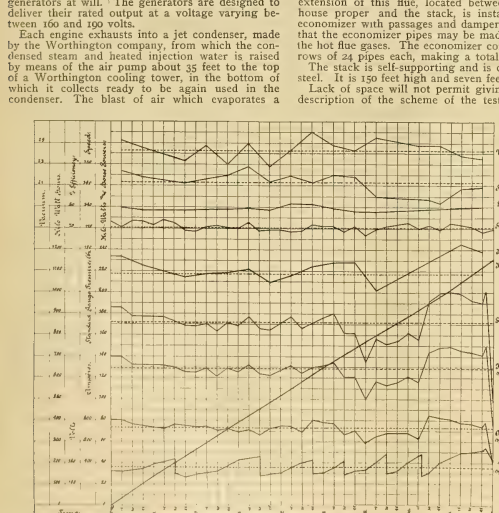

FIG. 2 EFFICIENCY TEST ON THE ENGLEWOOD AND CHICAGO ELECTRIC STORAGE-BATTERY ROAD.—GRAPHICAL LOG OF POWER-HOUSE TEST, NOVEMBER 26, 1897.

A typical graphical log of the boiler tests is shown by Fig. 1, which gives a comprehensive record of the data obtained on the last test made November 26, 1897, while the data obtained on the engines and generator during the same time are plotted in Fig. 2. These logs, taken in connection with Tables I. and II. of results give a complete record of the power-house performance on that day.

TABLE I.

RESULTS OF BOILER TESTS.

ITEMS.	Units.

Rate of Evaporation.		
Water evaporated from and at 212 deg. Fahr. per square foot htg. surface pr. hr.	lbs.	3.66
Water evaporated per hour from 100 deg. Fahr. into steam of 70 pounds gauge pressure—		
Per square foot grate surface	lbs.	98.46
Per square foot water htg. surface	lbs.	3 13
Commercial Horse Power.		
On basis of 30 lbs. water per hour evaporated from 100 deg. Fahr. into steam of 70 lbs. gauge pressure equals 34½ lbs from and at 212 deg.	H. P.	149
Horse power, builders' rating at 7 square feet of heating surface per horse power		200
Per cent. developed below rating	%	29 5
Efficiency.		
Percentage of total calorific power utilized	%	62 86

The coal, containing 10,145 British thermal units per pound, had a theoretical evaporative power of

$$\frac{10{,}145}{965.7}$$

or 10.5 pounds of water per pound. The evaporation from and at 212 degrees actually obtained per pound of dry coal was 6.6 pounds. Therefore the efficiency of the boiler and furnace was

$$\frac{6.6}{10.5}$$

or 62.86 per cent. This low efficiency is to be explained in part by the fact that the boiler was 26 per cent. underloaded. The equivalent evaporation per pound of combustible was 8.22, so that the efficiency of the boiler alone becomes

$$\frac{8.22}{10.5}$$

or 78.3 per cent. The boiler then loses by radiation, convection, and through the escaping gases 21.7 per cent. of the original heat units, while the furnace is to be charged with 15.44 per cent. of the lost heat, and 62.86 per cent. appears in the steam.

The economizer did not give satisfactory results on the test shown. This is not the fault of the economizer, however, but is due rather to the unfavorable conditions under which it was installed and is operated. Several large cracks in the brickwork flue leading from the uptakes of the boilers to the economizer on the outside of the power house allow air to infiltrate to such an extent that the flue gases are cooled fully 100 degrees before reaching the economizer. In spite of this fact, however, the economizer upon some of the other tests effected an economy of seven per cent., as figured from the gain in temperature of the feed-water. A graphical log of the boiler test made November 5th is shown in Fig. 3, which indicates a rise of 75.7° F. in the feed-water due to the action of the

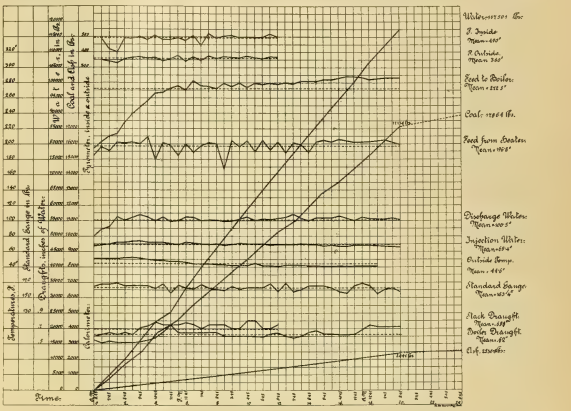

FIG. 3. EFFICIENCY TESTS ON THE ENGLEWOOD AND CHICAGO ELECTRIC STORAGE-BATTERY ROAD.—GRAPHICAL LOG OF BOILER TEST, NOVEMBER 5, 1897.

economizer. This log also shows the amount of coal required for banking the fires over night. Upon this test, however, a larger amount of coal was burned in the boilers, and thus a greater amount of flue gases passed about the economizer pipes. During the latter part of the test on November 26th the economizer was cut out of service.

The pumps used 14.36 per cent. of the water evaporated by the boilers. The feed-water, however, was heated by the pump exhaust from a temperature of 97.4 degrees Fahrenheit to a temperature of 202 degrees Fahrenheit, resulting in a theoretical gain of

$$\frac{100\ (202-97.4)}{1{,}196.5+32-97.4}$$

or 9.25 per cent. The actual amount of fuel, then, vacuum was but 24.25 inches. The engines were also overloaded during the entire run and were operated at 363 instead of 380 revolutions per minute. The difference in the power developed by the two lines of cylinders is due to an improper adjustment of the cut-off on the north line. With a few changes there is no doubt but that a material improvement can be made in the duty of the engines.

The indicator cards taken with one engine operating one generator, running on open circuit, show a friction load of 32.26 indicated horse power. This is but 14.86 per cent. of the average 217 indicated horse power, and is a very satisfactory figure.

The average efficiency between the horse power developed in the cylinders and the electrical power delivered on the switchboard is shown to be 79.27 per cent., which is also satisfactory.

The commercial efficiency of the generator (including the leads to the switchboard) at this load is

$$\frac{79.27}{85.14}$$

or 93.1 per cent., which is all that can be expected

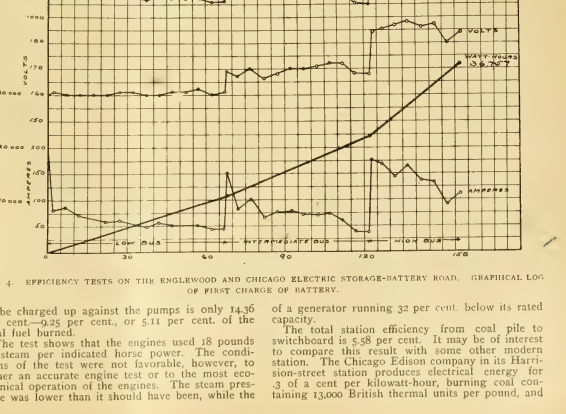

FIG. 4. EFFICIENCY TESTS ON THE ENGLEWOOD AND CHICAGO ELECTRIC STORAGE-BATTERY ROAD. GRAPHICAL LOG OF FIRST CHARGE OF BATTERY.

to be charged up against the pumps is only 14.36 per cent.—9.25 per cent., or 5.11 per cent. of the total fuel burned.

The test shows that the engines used 18 pounds of steam per indicated horse power. The conditions of the test were not favorable, however, to either an accurate engine test or to the most economical operation of the engines. The steam pressure was lower than it should have been, while the

of a generator running 32 per cent. below its rated capacity.

The total station efficiency from coal pile to switchboard is 5.58 per cent. It may be of interest to compare this result with some other modern station. The Chicago Edison company in its Harrison-street station produces electrical energy for .3 of a cent per kilowatt-hour, burning coal containing 13,000 British thermal units per pound, and

trosting delivered $1.05 per ton. The efficiency of that station, therefore, is

$$\frac{1.05\times1,000\times3.43\times100}{.003\times2,000\times13,000}$$

or 4.61 per cent. This indicates that the net efficiency of the plant tested is 20 per cent. better than that of the Edison station. The Edison station has an output of over 3,000 horse power, while the Englewood station has a maximum capacity of 500 horse power, which makes the comparison more striking.

The cost of fuel for a net kilowatt-hour on the switchboard is shown in the following table:

Average miles each trip		16.56		13.50

switchboard is shown to be .611 cent. This high price is to be explained, then, not by the inefficiency of the station, but by the fact that a high price is paid for a poor coal. With a more advantageous arrangement in the purchase of coal there is no reason why this station should not develop a kilowatt-hour for less than .3 cent.

II. DATA ON BATTERIES OBTAINED AT TIME OF POWER-HOUSE TESTS.

Two complete power-house tests made on November 5 and November 26, 1897, showed the amount of coal required to deliver a kilowatt-hour upon the switchboard. At the same time a complete log of the operation of the battery-charging pit was kept, which shows the history of each battery for the entire time of the test. In the test made November 5th the batteries were charged by the "three-voltage" method, but on November 26th the station was operated with one generator, and but one voltage was used to charge the batteries. During the latter part of this test the tracks became covered with ice, due to a sleet-storm, and it became necessary to change the batteries every half trip, which will account for the shorter time of charging indicated upon the latter part of the power-station log of the test, and also the smaller average number of miles per trip shown November 26th. The data obtained at the charging tables was checked up with the conductors' reports. These reports show the number of the car, the time occupied by each trip, the length of the run, and the number of the battery used. Table III. shows a summary of this information for the two days. This table shows the battery mileage for each day from the time of starting the road in the morning until the last trip at night. The cars are started out in the morning before the power plant begins to operate, using batteries charged the night before. No record of the energy used by these first trips was obtained, but the power required to charge an equal number of batteries for use the next morning after the test, appears in the result, so that no error results from this omission.

This table shows the actual number of miles which the batteries ran the cars on the two days. In addition to this, batteries were used to operate the auxiliary motors of the plant. These motors are upon the transfer carriage used to handle the batteries in the charging pits and upon the transfer carriage used to move the cars in the car barn. No record was obtained of the power used by these motors. A recording wattmeter was secured to operate in this auxiliary circuit, but unfortunately it was injured in transportation and could not be used. An effort was made to obtain an average value of the power used for each operation, by means of readings made at intervals of two seconds upon standard volt and ampere meters, but owing to the sudden fluctuations the data obtained was unsatisfactory. However, as the power used in the operation of handling the batteries and the cars in the barn may properly be charged to the operation of the cars, the total amount of energy delivered to the charging tables divided by the actual car mileage will give the total power required per car-mile. With the data at hand, however, this entire energy cannot be exactly divided into the amount used in the barn and the amount used on the road. The former amount will be a very small proportion of the latter, but this proportion will increase as the average length of battery trips decreases.

The power delivered to the switchboard and the amount of coal required upon November 5th is shown in the records of the test made that day. The power delivered upon November 26th was obtained for nine hours from the records of the test made from 3 p. m. to 12 p. m., and for the remainder of the day from the charts of the recording ammeter. The readings of this ammeter were carefully compared with the readings upon a standard ammeter, and found to be correct. These ampere readings were multiplied by the value of the average voltage found upon the test made that day, and the resulting watts added to those obtained during the test.

The following table shows a summary of the results of the two day's run:

	Nov. 5th	Nov. 26th
Date of test		
State of weather	Rainy	Rainy and cold
Kilowatt-hours delivered to switchboard	2,638.	2,895.
Kilowatt-hours used by cooling tower motor	151.	174.
Net kilowatt-hours delivered to charging bus-bars	2,487	2,721
Total number of car-miles	1,821.8	1,668.4
Kilowatt-hours on switchboard per car-mile	1.37	1.63
Pounds coal per net kilowatt-hour	6.9	6.44
Pounds coal per car-mile	9.43	9.50
Cost coal per ton	$1 90	$1.90
Cost coal per net kilowatt-hour	.0065	.00611
Cost coal per car-mile	.00897	.00900

It will be noticed that although the cost of a kilowatt-hour upon the switchboard was less in the second test, the cost of fuel per car-mile the same day was something more than in the test November 5th. This result is due to the fact that the kilowatt-hours required per car-mile were greater in the second case. The difference in the amount of energy required per car-mile is to be explained by the presence of a coating of ice upon the rails during the latter part of the day (November 26th). It is unfortunate that a freezing sleet-storm should have occurred at this time, though the results of the test indicate to a certain extent the amount of power required to operate the road under adverse conditions. Owing to the storm, the results of the two tests do not furnish a fair basis for a comparison of economy of the two different methods of charging the batteries.

The coal used upon both tests contained 10,145 British thermal units per pound and cost $1.90

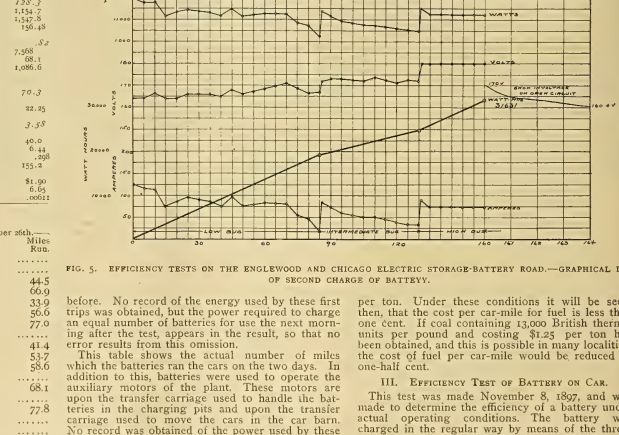

FIG. 5. EFFICIENCY TESTS ON THE ENGLEWOOD AND CHICAGO ELECTRIC STORAGE-BATTERY ROAD.—GRAPHICAL LOG OF SECOND CHARGE OF BATTEYY.

per ton. Under these conditions it will be seen, then, that the cost per car-mile for fuel is less than one cent. If coal containing 13,000 British thermal units per pound and costing $1.25 per ton had been obtained, and this is possible in many localities, the cost of fuel per car-mile would be reduced to one-half cent.

III. EFFICIENCY TEST OF BATTERY ON CAR.

This test was made November 8, 1897, and was made to determine the efficiency of a battery under actual operating conditions. The battery was charged in the regular way by means of the three-voltage method. It was then discharged while making a round trip, and was then placed upon the charging table and again charged, thus giving two charges and one discharge to determine the efficiency. The battery used was one which had operated at that time over 8,000 miles, and was taken for the purpose of this test immediately after it had made a trip similar to the one upon which it was tested.

The current and voltage upon the two charges were obtained by means of standard Armour Institute instruments, and readings were taken every five minutes. The data is shown plotted graphically in Figs. 4 and 5, in which the abscissæ represent time in minutes.

The observations made upon the car while the battery was discharging consisted in taking voltage and ampere readings every five seconds, while the car was in motion, the time between stops and the length and location of each stop, and a continuous record of the speed.

The voltmeter was a standard Weston instrument from the Armour Institute, and was connected across diagonal corners of the battery tray. Each set of batteries consists of 72 cells, arranged in four groups of 18 each. Each cell contains nine plates—four positive and five negative. The negative plates are of the "chloride" type. The positive plates are of the "Manchester" type. The batteries were furnished by the electric Storage Battery company of Philadelphia. Each plate is 14⅜ inches long

and 7¾ inches wide. The negative plates are one-fourth inch and the positive plates are five-sixteenths inch thick. The outside dimensions of the hard rubber containing jar are 5¼ by 8½ by 17¾ inches deep. The weight of the lead elements of each cell is 75 pounds, of the jar five pounds and of the electrolyte 20 pounds, making a total weight for each cell of 100 pounds. Each group of 18 cells is provided with separate contact plates, which are connected by means of cables to the controller. The controller has five points and allows the following combinations:

1. The four sets of batteries in parallel.
2. Batteries in series parallel in sets of two.
3. Batteries in series with resistance.
4. Batteries in series without resistance.
5. Same as No. 4 with field of motor shunted.

The voltmeter was so connected that it gave the voltage at the battery terminals for each combination. The car tested was 20 feet long in the body, 30 feet long over the platforms, and had a seating capacity of 28 passengers. The car weighed 13½ tons with the batteries, the batteries and trays adding about four tons to the usual weight of a car of that size.

The motor upon the car was a 50 horse power Walker four-pole series motor. The entire current used at any one time passed through the armature, so that the ammeter was inserted in the positive brush leads. The ammeter used was of the round-pattern Weston type, and had been found to be correct by comparison with an Armour Institute standard. Five observers were used to obtain the ammeter and voltmeter readings; one called the time every five seconds, two read the instruments, and the other two kept the records. At times of starting the instruments were read oftener than at five-second intervals. A trial trip was made with another battery to get the observers acquainted with their positions, and as the fluctuations in the current were not violent nor many, it is believed that the results represent very nearly the actual facts.

The duration of the stops and the time the car was in motion between stops was obtained by means of a stop watch.

The record of speed was obtained by means of a Boyer speed recorder belted, by means of a flexible belt, to the car axle. By means of pressing lightly upon the recording pencil a dot was made in the speed curve every five seconds.

The record of the speed recorder has been transferred to a larger scale and is shown in Fig 6. The same diagram has been used to show the kilowatt-hour and elapsed-time curves. No attempt was made to indicate upon this diagram the ampere or voltmeter readings, as this information is given upon a larger scale in the acceleration tests.

The test may be divided into four parts as follows:

	Distance, Miles.	Time, Min. Sec.	No. of stops.	Av. speed miles per hour.
1. Power house to Blue Island	5.9	28.20	12	12.5
2. Blue Island to power house	5.91	29.55	19	11.8
3. Power house to Sixty-third St.	5.3	27.40	13	11.5
4. Sixty-third St. to power house	5.3	27.50	13	11.5
	22.44	113.45	57	11.84

Length of one back-up, stop 18..... .04 mile

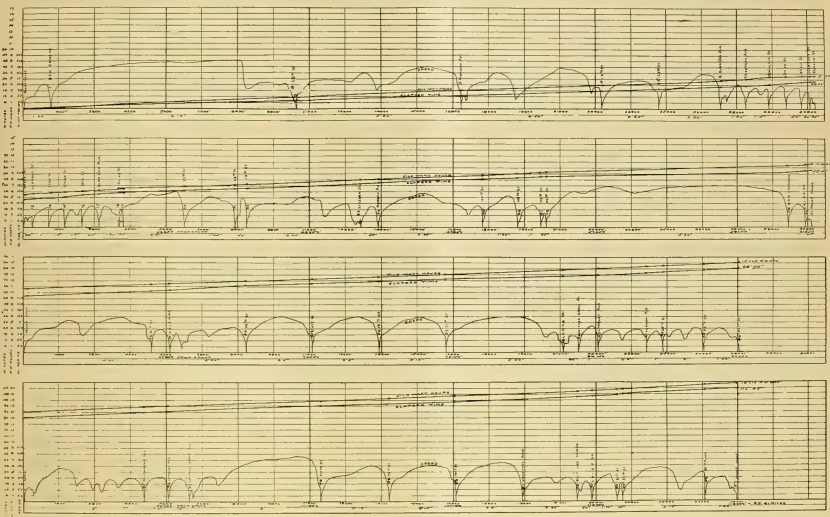

FIG. 6. EFFICIENCY TESTS ON THE ENGLEWOOD AND CHICAGO ELECTRIC STORAGE-BATTERY ROAD. GRAPHICAL LOG OF BATTERY DISCHARGE AND SPEED OF CAR.

In making the stops an effort was made to approximate actual service and in every way reproduce the conditions of an actual trip. No regular passengers were carried, however, the load consisting of nine observers, the motorman and conductor. The motorman was instructed to follow his usual custom of coasting where possible. The track was dry for the first two parts of the test, but during the last two parts it was raining and the tracks were wet. The energy taken from the battery was as follows:

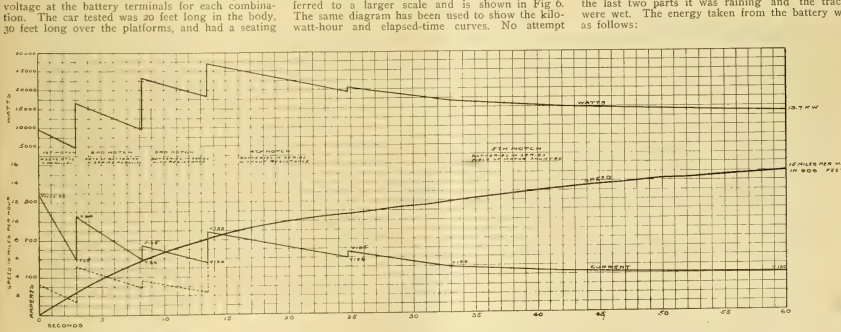

FIG. 7. EFFICIENCY TESTS ON THE ENGLEWOOD AND CHICAGO ELECTRIC STORAGE-BATTERY ROAD.—GRAPHICAL LOG OF ACCELERATION TESTS.

	Distance. Miles.	Watt-hours	K. W. hours per car-mile.
1. Power house to Blue Island	5.9	5,533.1	.920

EASTERN OFFICE: 108 TIMES BUILDING, NEW YORK.

Trade Supplied by Western News Co.

COPYRIGHT.—Not only the title but the *entire contents* of each number of the WESTERN ELECTRICIAN are copyrighted. This paper is entered at the Chicago postoffice as mail matter of the second class.

SUBSCRIPTION, in advance, postage prepaid, $3.00 for a full year of 52 numbers; in clubs of four or more, $2.50, with free extra copy for eight subscriptions; foreign countries, $5.00 a year; single copies, 10 cents. When change of address is requested, the old address as well as the new should be given.

CORRESPONDENCE relating to electricity or any of its practical applications is cordially invited, and the co-operation of all electrical thinkers and workers earnestly desired. Clear, concise, well written articles are especially welcome, and communications, views, new ideas, local newspaper clippings, or any information likely to interest electricians, will be thankfully received and cheerfully acknowledged.

ADVERTISING.—THE WESTERN ELECTRICIAN—**the only general electrical paper published in the West**—thoroughly covers a territory *exclusively its own*. THIS IS A CLAIM WHICH CAN BE MADE BY NO OTHER ELECTRICAL JOURNAL IN THE UNITED STATES. Electrical merchants and manufacturers *desiring western trade* will appreciate the EXCEPTIONAL VALUE of this journal as an advertising medium in its special field. Advertising rates are moderate, and will be furnished on application.

Boston is the storm center this week, and the good people of the Hub are going through a pretty hard siege according to the accounts that reach the outside world. The Chicago Tribune on Wednesday contained an announcement that "all telegraph wires connecting Boston with the outside world were disabled by the storm," and the further explanatory line that its account of the storm, which was dated at Boston, was received "by long-distance telephone." The electrical interests generally were badly crippled. There were some interesting features which serve to illustrate the condition of affairs throughout the East. A dispatch from New York says that owing to the storm and the condition of the telegraph lines all business between Boston and New York was practically suspended. "Every message from Wall street to Boston had first to be cabled to London and then sent back to Boston. This method of communication was both tedious and expensive, and in the majority of cases Boston business was practically suspended." It seems rather strange that our eastern friends did not avail themselves of the long-distance telephone lines.

Corporation laws are generally obnoxious, as is all other class legislation, and it sometimes happens that when these statutes cannot be evaded easily the big corporations ignore them until they are enforced by officials. This was the case in Kentucky, and now the Franklin County grand jury has made a report filing 121 indictments against the chief corporations doing business in the state for failing to report to the secretary of state in order that a franchise tax may be assessed against them by the State Board of Valuation and Assessment. The penalty for such failure is $1,000 and $50 a day in addition for each day the corporations have failed. Not one of the corporations indicted has reported since 1893, or since the corporation law went into effect, it is said. Prominent among the companies named are the principal electric corporations throughout the state, including the Western Union Telegraph company, the Louisville street-railway companies and similar companies in Covington, Newport, Lexington, Frankfort, Paducah and Owensboro, electric-light companies in Ashland, Frankfort, Paris, Lexington, Carlisle, Owingsville, Owensboro, Richmond, Maysville, Hopkinsville, Paducah and Hardrodsburg; and the telephone companies in all parts rodsburg, and the telephone companies in all parts be tested when the matter is taken into court.

Fighting fire with fire is the plan suggested by Mr. Doherty of Madison as a solution of the question of municipal ownership of electric-lighting plants. He calls attention to the fact that much of the trouble experienced by central-station managers who have street-lighting contracts is brought about by those who propose to operate municipal plants in conjunction with city waterworks. It has been contended that when cities engage in electric lighting part of the actual cost of operation is charged to other departments. In Chicago it is now admitted that the Fire Department carried a goodly portion of the expense, while in smaller towns the waterworks usually bear this burden. It is almost impossible for an outsider to separate the items of cost, and those directing the plants have no desire to do so. As a result the public is misled and false statements of expense are circulated. Mr. Doherty's remedy is to show that, according to the admissions of city officials, the waterworks are not operated as economically as they could be. In support of this view central-station companies are advised to propose leasing the waterworks wherever trouble of this kind arises, and thereby show that they can effect a saving in this service in keeping with that which the advocates of municipal-lighting plants claim is possible by their plan. The suggestion is worthy of serious consideration.

We have already alluded to the contemptible trick to which the publisher of an eastern electrical journal resorted in circulating among advertisers a fac-simile letter purporting to be addressed to him by a manufacturing concern in which serious reflections were made upon the other electrical publications of the country. It only remains to be added that investigation of the matter revealed the fact that the circulars issued by W. J. Johnston—who, of course, was at the bottom of this scheme —were entirely false and malicious, and even misrepresented the agent of the company whose services were enlisted. The president of the manufacturing company mentioned has repudiated the statements of his subordinate, and in a letter to the Western Electrician expresses his regret that such unauthorized use should be made of the company's name and his disapproval of the entire proceeding. It is significant, too, that as soon as the matter was brought to the attention of the company, Mr. Johnston was peremptorily ordered to withdraw the offensive document from circulation. A complete statement of the facts in the case over the signatures of presidents of the other electrical publishing companies is now being circulated. It tells the story of the last of Johnston's tricks in a straightforward, dignified manner, and thoroughly exposes the disreputable Johnston methods of which this is a fair specimen. It is a severe arraignment, but is well deserved.

It is proposed to make the forthcoming electrical exhibition at New York more than a mere display of commercial apparatus, such as generally constitutes an industrial show. The management, with the co-operation of the New York Electrical society and a committee of eminent electrical engineers, has undertaken an educational feature that promises excellent results. This determination cannot fail to enlist the active support of every person interested in electrical advancement, and it ensures, moreover, a standing and consideration for the enterprise that it could not otherwise command. The work of preparation for the event is certainly in competent hands, and no doubt the expectations of the fraternity and the public generally will be fully realized. The service which the New York Electrical society will render in this instance will be in keeping with its admirable record as a public-spirited association. It has already done much to entitle it to consideration and respect, and has placed the electrical fraternity of the country as well as the city of New York under lasting obligations for promoting and encouraging scientific work and engaging the attention of the general public to the advancement made in this field.

Whatever views may be entertained upon the advisability of permitting overhead trolley wires to be placed in crowded city streets, especially in the downtown business district, there is unanimity of opinion upon the advantages gained through the extension of the electric lines into the suburban districts. It is hardly necessary at this late day to direct attention to the benefits bestowed upon the mass of workers who are no longer compelled to live in overcrowded and otherwise unsuitable quarters, huddled together without regard to comfort, convenience or decency, but are now enabled to secure homes away from the noise, dirt and confusion of the city. The competition of the trolley has made the steam roads improve their suburban service and reduce the fare charged upon their lines. This has been particularly noticeable throughout New England and the Atlantic states and in Chicago. The subject has attracted the attention of steam-railroad men and has brought forth much discussion. The New York, New Haven and Hartford Railroad company has suffered greatly from competition of trolley lines, and has bitterly contested every point with the electric system, but it has finally resulted in victory for the newcomer.

In the West the Chicago and Northwestern company has earned the distinction of being the most active fighter of electric lines. Last summer finding that the Evanston trolley line was making inroads on its revenue from suburban traffic, it made material reductions in its fares and improved its service. Later an electric line, with the aid of a "bus" service, introduced cheap fares between Aurora and Geneva, and the Northwestern was compelled to reduce rates and increase the number of trains. The latest move of the steam road is the greatest concession yet made to the electric system. The Northwestern announces that it has purchased a parallel line which, when completed, will extend from Appleton to Fond du Lac, Wis. The company has also an option on the Appleton electric street-railway line which is to be built to Fond du Lac on the south and DePere on the north, and if it buys the road it will abandon many trains between Green Bay and Fond du Lac and handle the business by the electric line. The Fox Valley towns will all sooner or later be connected with the electric lines. There is already a road from Aurora to Carpentersville, finely equipped and doing business. The Appleton line is said to be projected to link such towns as DePere, Wrightstown, Little Rapids, South Kaukauna, Combined Locks, Little Chute, Kimberly, Appleton, Neenah, Oshkosh and Fond du Lac. The Appleton plant is an old one and has only recently emerged from the hands of a receiver, but the Northwestern people have determined that they must meet the conditions and furnish the service demanded or see the suburban business pass into other hands. The experience of the steam railroads between St. Paul and Minneapolis is still remembered.

Telephone News from the Northwest.

[From the Minneapolis correspondent of the Western Electrician.]

The Northwestern Telephone Exchange company is increasing the number of wires between Minneapolis and Litchfield to relieve the rush on the present wires.

Madison Lake, Minn., wants telephone connection with neighboring towns.

The Dakota Central Telephone company will extend its lines to Watertown, S. D., in the spring.

At the annual meeting of the telephone company at Rush City, Minn., it was decided to reinforce the line from Danewood to Grass Lake and make it permanent.

A local telephone company has been formed at Litchfield, Minn., to cover the county. A local telephone exchange is in prospect for Graveville, Minn.

The long-distance company's wires between Sioux Falls, S. D., Sioux City, Ia., and Yankton, S. D., are now in operation.

The application of the Minnesota Central Telephone company of Willmar, Minn., for admittance to Minneapolis, which is backed by the independent telephone companies of the Northwest, is being warmly seconded by a number of the newspapers of Minneapolis and the smaller places. The jobbers of Minneapolis are anxious to have the connection made, for it will open to them a field which they have been unable to reach heretofore save by telegraph.

Hulburd & Johnson of Morris, Minn., are arranging to put in a local telephone exchange at Morris, Minn.

The Rocky Mountain Bell Telephone company will extend its lines from Missoula, Mont., to Wallace, Idaho, and will make connection between Great Falls and Augusta.

A telephone company has been formed at Ellendale, N. D., to put in a system to cover Dickey County.

A telephone company has been formed at Manitowoc, Wis., to run a line from Manitowoc, Wis., to Brillion, via Cato.

The independent telephone companies of Northeastern Iowa propose an anti-Bell alliance at La Crosse, Wis., by which several hundred towns in Iowa and Southern Minnesota shall be connected at a uniform rate of 15 cents per message, whether the distance be 10 miles or 200. The deal will probably go through.

The Northwestern Telephone Exchange company has now connection between Minneapolis and Sioux City, Ia., and by way of Albert Lea to several hundred towns in eastern, central and western Iowa. The company has built about 1,000 miles of line this season.

People of Lowry, Minn., want telephone connection with Alexandria, Minn., and are forming a company for the purpose.

Nolan & Hebden will build a telephone line from Minocqua, Wis., to their summer resort on Squirrel Lake in the spring.

E. M. Walsh of the independent telephone company of Fisher, Minn., says his lines will be extended to Grand Forks and Crookston, Minn., in the spring.

The Chequamagon Bay Telephone company of Ashland, Wis., has arranged for a telephone concert to be give February 19th, for its patrons. The Boston Opera company will give an entertainment in Eau Claire and the music will be transmitted to Ashland. This company has recently awarded contracts for constructing telephone exchanges in Ashland, Bayfield, Washburn, Iron River, Ironwood, Bessemer and Hurley. Long-distance lines will be extended to Duluth and Superior, with branches to other points.

O. F. Burlingame has been appointed manager of the Eau Claire Telephone company's exchange at Eau Claire, Wis.

The Eastern Wisconsin Telephone company has been incorporated at Elkhart Lake, Wis., to operate a telephone system in Sheboygan County.

The Northwestern Telephone Exchange company will string another wire between Fargo, N. D., and the Twin Cities, as the present wire cannot handle the business.

The American Telephone and Telegraph company has connected with Burlington, Ia.

H. L. Sumption and Irving Todd, Jr., have been granted a franchise for a telephone exchange at Hastings, Minn.

The Mississippi Valley Telephone company has finally been granted the privilege of stringing its wires through Fort Madison, Ia., to connect its Burlington and Keokuk exchanges.

The Madison (Wis.) Journal is authority for the statement that there are over 60 telephone companies operating in the state of Wisconsin.

The report of the condition of the Southwestern Wisconsin Telephone company of Dodgeville, Wis., shows receipts and earnings of $1,040 and disbursements of $644. Repairs, improvements and extensions have been made to the extent of $1.777 There was $950 realized from sales of stock

---

Manufacturers of telephone apparatus will be interested in the following announcement by T. J. Corrigan of Monticello, Ark.: "We are contemplating putting in a telephone system here, also a country line. We have a franchise for the town and I think that I can get about 50 subscribers if I get a country line. This is a great cotton town and does lots of business, and it is really necessary to have telephones."

Effect of Long-distance Telephony on Railroad Travel.

In a recent issue of the Western Electrician was noted the statement of President Callaway of the Lake Shore railroad admitting that the growing use of the long-distance telephone was cutting into the passenger business of his road. Since then the subject has been taken up by the New York Tribune, which has interviewed a number of prominent steam railroad men and others.

Chauncey M. Depew is quoted as follows: "There is no doubt that the long-distance telephone is affecting short-distance railroad travel to a considerable extent. By short-distance travel I mean that within 100 miles or less of the cities. One reason is that manufacturers who used to communicate with their stores and offices in the cities by messengers or by some member of the firm or corporation going to and fro frequently, now find that they can do business as well and with a saving in time by using the telephone. Then the country merchant who used to go to town once a week to replenish his stock finds that he can replenish it daily, if need be, by using the telephone, according to the demands of his business. Thus he does not have to carry so large a stock, but lets the wholesaler carry it for him. His wife knows this, and so he no longer has a good excuse for going to town often. These I look on as the regular sources of railroad travel that are cut off by the long-distance telephone. Now for the irregular sources. Social communications over short distances are now performed to a large extent by means of the telephone. The shopping business is another important factor. Take people living within 25 or 30 miles of a good-sized city; they mostly have telephones in their houses, and instead of going in for shopping purposes at short intervals they call up the stores by telephone, and only go shopping in person occasionally. Then if we take places like Syracuse, Rochester, Utica, Albany and their outlying districts, we find that a good deal of business is done by telephone, and much railroad travel for short distances is saved to the people. All these things taken together show that a large amount of business is thus cut off from the railroads. But the increase of population is making up for the loss thus occasioned. In other words, the telephone keeps the factories at the little places, while the main offices are in the larger ones. It is so with all inventions; at first they seem to be injurious to certain interests, but ultimately they prove of advantage all around."

All railroad men, however, do not agree with Mr. Depew and Mr. Callaway. At the office of the Erie railroad in Cortlandt street, the inquirer was referred by President E. B. Thomas to D. I. Roberts, the general passenger agent of the company, as the man best qualified to give information on the subject. Mr. Roberts, when seen, expressed surprise at Mr. Callaway's statement, and said that there was nothing in the experience of the Erie people to justify it. "This matter was first called to my attention three or four weeks ago," Mr. Roberts went on, "and I said then that I did not think it possible for the telephone to have affected the business of the railroads to any extent. I was amused as well as surprised when I read what Mr. Callaway is quoted as saying, and I do not see where he gets the evidence for such a statement. Certainly the passenger business is not languishing with us." Mr. Roberts called for the records showing the business of the company to western points for November, 1897, and made a comparison with that done during the same month in the previous year, showing that the number of passengers carried to Chicago and other points west of Buffalo and Pittsburg was more than 1,000 larger in 1897. "Even if there had been a falling off," he continued, "I do not see how any one could positively say that it was due to the increasing use of the long-distance telephone. Undoubtedly there are cases where a man talks over the wire and so saves a railroad trip, but they are too few to make any difference in railroad receipts that is worth considering. Long-distance telephoning is too costly, for one thing, and business men do not care to trust important matters to a telephone. They can never be absolutely certain that they are talking with the right man anyway, although it is possible to recognize a man's voice over a long distance. Now it costs $9, I believe, for a five-minutes' conversation with Chicago. For a man to go to Chicago would cost $50 at least, to say nothing of his time. That amount would give him 25 or 30 minutes' talk on the telephone. But when a man goes to Chicago on business it is likely to be of sufficient importance so that he has to see 10 or a dozen men, and if he should call each of them upon the 'phone he would soon pay more than his railroad fare. I don't know of men doing this. Of course, there is a saving of time in telephoning, for one can get an immediate answer, and I can easily see how the telephone might interfere with the use of the telegraph. But in the city important business matters are not done by telephone; it is only details that are looked after in that way, and details at a distance can be arranged by mail. I know that for my part I would not give an important order or transact any important business over the telephone. One might be talking with the right man, but there could be no absolute certainty of it, and there is too much danger of other people hearing what is said."

When Samuel Sloan, president of the Delaware Lackawanna and Western railroad, was called on at his office, in Exchange Place, he said that he had seen Mr. Callaway's statement, but he did not care to say anything about it. So far as he was aware, the business of his company had not been affected by the use of the telephone. His view of the matter was that all improvements of that kind had a tendency to increase business, and the railroads were pretty sure to get their share of the increase. W. F. Holwill, the general passenger agent of this company, was also seen. He said that it was a surprise to him to read what Mr. Callaway had said, or was reported to have said, and that nothing of the kind had been suggested by the experience of the Lackawanna road. Instead of falling off, their passenger business showed a gratifying increase, but if there had been a decline he was unable to see how anyone could attribute it to one specific cause, like the competition of the telephone.

Another railroad man said that in his opinion a great many railroad journeys were saved by men making use of the 'phone, and as an illustration cited this instance: "A friend of mine, who is in the insurance business in a western city, had some important business to transact with a company in Hartford. Sitting at the desk he simply called up the man he wanted on the wire, and in 15 or 20 minutes the business was all cleaned up. He saved his railroad and hotel bills; he saved his time; he saved all wear and tear, and even if the cost of using the 'phone had been more than all his expenses, there would have been a saving all around. I believe there are tens of thousands of such cases every day, and the aggregate must tell largely on the receipts of the railroad companies.

A well-known insurance man, when the subject was suggested to him, cogitated a moment, and then said: "I never thought of the matter before, but now that I do think of it, I feel sure that a good deal of money is thus saved that would otherwise go to the railroads. Whether it is enough to affect railroad earnings appreciably, of course I can't tell. I recall several instances in point. Last winter, for example, I wished to engage a man for an important place in our business, and it was necessary to look up his references in Boston. Formerly I should have made a trip to Boston for the purpose, and spent a good share of a day in visiting different men. Instead of that, I sent a boy to call up the men I wanted to see on the telephone, one after another, and not more than half an hour of my own time was taken in doing the entire business. In a telephone conversation, especially with the long-distance 'phone, one talks right to the point, and there is no chaff or story-telling or anything of that kind. If I had gone to Boston, it would have cost me three or four times as much as the telephone charges, counting hotel expenses as well as railroad fares. But if the use of the telephone had cost more than the fares there would still have been economy in it, for the saving of time was a very important element. It would certainly have taken me away from my business for an entire day. The matter might have been attended to by correspondence, but it was too slow a method, and, besides, in a personal interview one thing suggests another and a subject may be gone into thoroughly. Then we have an agency in Philadelphia, and, now that I come to consider it, I remember that we do not see the manager of it half as often as we used to. But he calls us up on the telephone frequently, and we do business that way, and he only comes over here once or twice a year. The saving in carfares on this account is considerable. I suppose there are thousands and thousands of similar cases in this and other cities, and the aggregate amount of money thus withheld from the railroads must be large."

A business man having large interests in this city also showed surprise when asked whether in his experience the long-distance telephone had any important influence on railroad travel, and then remarked: "It is an interesting matter, surely, but this is the first time I have known it to be put in that way. In my own business, of course, we make very large use of the telephone within the city limits. Without it we would not be able to do as much business as we do, at least without enlarging our force. Telephoning out of town does not come in there at all. But I am connected with a large company, which I do not care to name, which has four factories in two different states. One of them is three hours distant from New York, another five hours, another six hours, and the last eight hours distant. It is important that the city office should be in close communication with the factories, and after every meeting of the executive committee of the directors the factories are called up on the 'phone and instructions given to the managers. Without this means of communication a good deal of traveling would be necessary, though no doubt part of the business would be done by telegraph and mail. Without making an accurate estimate, I should say that at least $4,000 or $5,000 was saved in railroad fares every year, while the cost of using the telephone cannot be more than $1,000 or $1,500. But the chief saving is the matter of time. Suppose it were necessary for the president of this corporation to visit the four factories at frequent intervals; the time it would take would be a serious matter, for when a man gets a salary of $25,000 a year, it is easy to see that his time is valuable. From my observation, though,

it would seem that the long-distance telephone is not used nearly as much as it might be. In the case of the company I am speaking of it required a good deal of persuasion to get them to put one in, for they thought it would be only a toy and not of practical value. After trying it they soon saw the value of it."

It might be supposed that the use of the telephone would have a considerable effect in curtailing travel to the city by men engaged in business in towns near and remote who are in the habit of purchasing goods in New York, but inquiry shows that this is not the case. A question put to a representative of one of the largest dry-goods houses in the city brought out this response: "Of course, we make a good deal of use of the telephone in our business, but most of it is right here in New York. We send 50,000 messages a year over the 'phone, and the proportion of them that go outside is very small. I cannot say just how much it is, but the outside messages include all those to Jersey City, Hoboken, Elizabeth and other near places that are almost a part of the city. While we have a long-distance telephone in every one of our 13 departments, they are little used in receiving orders from customers some distance away. I do not suppose there is more than one such order a day on the average. Suppose a man in a town 300 or 400 miles away wanted to give an order to this house. The chances are that he would want something from several departments; if so, he would have to call up each one separately, and the expense would soon more than equal his railroad fare and hotel bill. Besides, when a merchant of that kind is making his purchases he usually wants to deal with several houses in different lines, all of which he can do in a single day by coming here himself. And then, when he comes in person, he has a chance to look at a variety of samples and get new ideas, to say nothing of the good time which he always counts on in New York. I know that in some parts of the West a great deal of business is carried on by telephone, as for example, between Denver and Leadville, and in such cases money that would go in railroad fares is kept from the railroads possibly in sufficiently large amounts to have some effect upon their earnings; but I see no reason to believe that it is so in the vicinity of New York, at least in the carrying on of the dry-goods business."

Legal Rights of Telephone Companies.

In the United States Court of Appeals at Richmond, Va., on February 1st, Judge Simonton handed down an opinion in the case of the city of Richmond against the Southern Bell Telephone and Telegraph company, involving the validity of the application to the telephone of the act of Congress of 1886, declaring that the streets of a city are post roads of the United States.

Judge Simonton holds that while the act specified

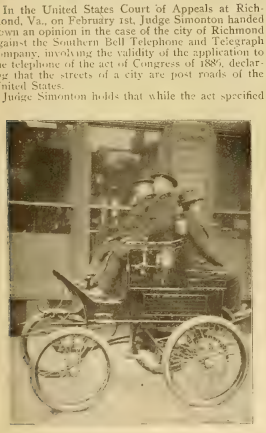

FIG. 1. NEW ELECTRICAL EQUIPMENT FOR VEHICLES.—SIPE & SIGLER ELECTRIC TRAP.

only telegraph companies are entitled to protection under it provisions a telephone line is to all intents the same thing and therefore entitled to the same privileges.

The Bell Telephone companies' charter had expired and the only ground of opposition might be revoked, but was disposed from interfering with the company's poles and wires. The object of the decision is to prevent the city from damaging the company's property, but the city retains the right to control the streets and the poles and wires in the

The contract for all the work in connection with the lighting of the Parliament and departmental buildings at Ottawa, Canada, has been placed with Ahearn & Soper of that city.

New Electrical Equipment for Vehicles.

To state that a company has been organized in Chicago to build and supply electrical motor equipments to carriage builders is to mark a really important point of departure in the new electrical carriage industry. The idea is to supply complete electro-mechanical equipments for the propulsion of vehicles and also to supply launch equipments to boat builders. This company—it is the Fischer Equipment company of 340 Dearborn street, by the way—has developed a complete line of apparatus for the motor, the usual form of steering device, wire-spoke wheels, ball bearings and rubber tires.

The battery cells and trays are shown in Fig 2. This type of battery is manufactured especially for the Fischer company by Sipe & Sigler of Cleveland, O., the manufacturers of the Willard storage battery. The Cleveland firm has just closed a contract, extending over a period of three years, with the Fischer Equipment company for Willard storage cells amounting, it is said, to no less than $238,000. The battery is claimed to be as light as possible

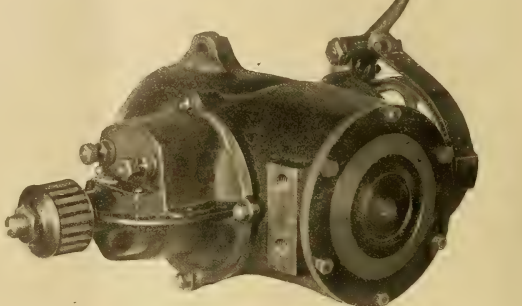

FIG. 3. NEW ELECTRICAL EQUIPMENT FOR VEHICLES.—MOTOR AND BRAKE.

work, and offers it to the carriage builders of the country, who can apply it to any suitable class of vehicle of their own design and finish. The Fischer company does not build electric carriages, but proposes to pilot any carriage manufacturer "into a successful issue with the electrically self-propelled vehicle." The idea seems to be a good one, and the company has thoroughly protected its special devices by patents. One electric trap or drag equipped with the Fischer company's apparatus has been in operation for some time. It was built by the Kimball Carriage Manufacturing company for Mr. Samuel Insull, the president of the Chicago

and to be practical and reliable. The cells are all incased individually in hard rubber shells, sealed at the top, so that they are clean and easily handled. For vehicle work each complement of cells is mounted in four trays, each trayful being connected up ready for use. The entire mechanical construction is designed expressly for transportation work, as is also the output and rating thereof, which are fully guaranteed. All parts of the battery are separated into interchangeable sections. The life of the battery is insured for four years for a percentage of the original cost.

In Fig. 3 is illustrated the commutator side of the

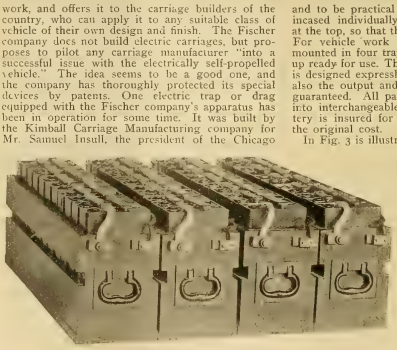

FIG. 2. NEW ELECTRICAL EQUIPMENT FOR VEHICLES. STORAGE BATTERIES.

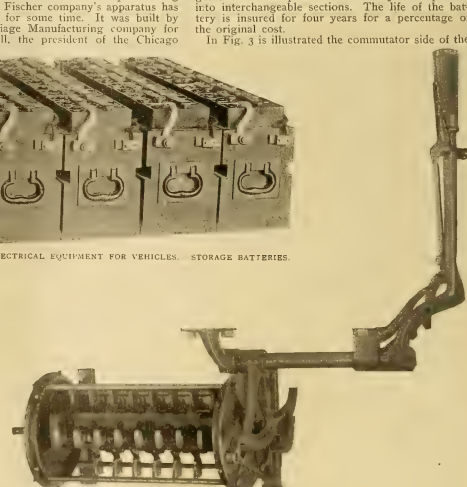

FIG. 4 NEW ELECTRICAL EQUIPMENT FOR VEHICLES CONTROLLER AND BRAKE HANDLE

Edison company. As shown in Fig. 1, this smart vehicle can carry four persons and is decidedly attractive in appearance. The mechanical operation may be judged by a general description of the type of apparatus employed.

The equipments offered by the Fischer company have been developed by C. E. Woods, an electrician who has spent much thought and labor on the problem of electric vehicle propulsion. He uses a special low-speed motor, storage cells of a special type and specially devised wireless controller, reversing switch, braking apparatus incorporated with the motor, the hand brake being shown at the right. This brake is practically a part of the motor and is operated by the same lever that operates the controller, making it impossible to apply the brake without first cutting current from the motor or to turn the current on without first releasing the brake. The motors are said to be the lightest on the market in proportion to capacity. They are completely enclosed and designed to run in any position necessary to attach them to boat or vehicle, the journal being so constructed as to keep the oil reservoir on the underside in any position.

They have self-oiling bearings, except when ball-bearings are demanded. The frames are of steel. The armature is of the iron-clad type, wound with removable coil windings. The journal heads and sockets are made from a special aluminum casting on such sizes as are used for vehicles and launches, which gives great strength and lightness combined, while the journal bearing itself is of brass. Either field-coil or armature can be removed without disturbing body of motor, by taking out bolts on each head, and the removable cover over the commutator permits of instant access to the brushes, which consist of only two sets. It is claimed that after three hours' run at maximum load the temperature of the motor will not rise more than 80° above that of the surrounding atmosphere. Two motors, as in Fig. 1, are recommended for the Fischer equipments, although a single-motor equipment can be supplied.

A side view of the controller and brake handle is given in Fig 4. This ingenious combination device

ARMORITE TROLLEY POLES.

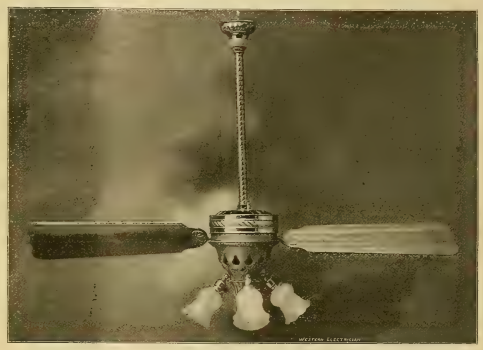
is used to start or stop the vehicle or to operate it at any of three speeds. No resistance is used, the batteries being grouped in series or parallel to obtain the electromotive force desired to vary the speed. It is noteworthy that in this controller there is not a single wire or screw connection of any kind used in the switching or moving parts; neither is there a brush contact of any kind. Knife-switch contacts are used, which clean themselves from corrosion or dirt, and so insure a uniform contact throughout the instrument, which is necessary when batteries are working in parallel. The circuit is instantaneously broken at eight different points, reducing the arcing to a minimum. The contacts are all of a carrying capacity equal to twice their rated value. The controller may be placed either under the seat or under the bottom of the vehicle. The controller and brake handle may be placed either on the right or left-hand side of the vehicle. The reversing switch is similar to the controller in construction.

The motors are arranged for single reduction, the pinion on the armature shaft meshing into a gear-wheel on the hub of each rear driving wheel. These equipments will climb a 10 per cent. grade with full load, it is said. For steep hill climbing a double-reduction gear is supplied. The batteries have a capacity of 30 miles' continuous run at three, six or 12 miles an hour.

The officers of the Fischer Equipment company are: President, S. M. Fischer; vice-president and general manager, C. E. Woods; secretary and treasurer, O. J. Friedman. Mr. Fischer, the president, has extensive business interests. He is president of the Wisconsin and Michigan Railroad company and also of Street's Western Stable Car Line and is interested in several other business enterprises. Mr. Friedman is a well-known Chicago business man.

Hunter Ceiling Fan.

The illustration shows the new direct-current ceiling fan of the Hunter Fan and Motor company of



HUNTER CEILING FAN.

Fulton, N. Y. The general excellence of this company's apparatus is well known. The motor has a short magnetic circuit, with powerful soft-steel fields and a toothed armature. The two bearings are submerged in oil and are spread far apart to prevent the armature from rubbing against the pole-pieces, as is often the case with a short single bearing after a little wear. The blades have a sweep of five feet, and at 192 revolutions per minute the motor is said to take less than one ampere. This small consumption of current is one of the noteworthy advantages of the apparatus. A two-speed switch is placed at the bottom of the fan. As shown in the picture, the fan can also be made to serve as an electrolier.

Armorite Trolley Poles.

Ever since the Armorite Interior Conduit company moved its plant to Pittsburg to obtain the greater facilities for the production of Armorite that were made necessary by the rapidly growing demand for that conduit, the company has forged ahead in a manner which must be very gratifying to those interested in it.

Recently the Armorite company brought out a specialty in the way of a wood-lined tubing for use in chemical works, salt mines and other places where a lined tubing is necessary. The production of this specialty has become a branch of the company's business.

But a more important departure in the line of Armorite manufacture is that of supplying poles for street railways. The accompanying cut gives an idea of one of the styles of poles that the Armorite Interior Conduit company is now manufacturing. Of course this is but one pattern, and blue prints can be furnished showing the variety of poles that the company is prepared to ship.

The Armorite Interior Conduit company produces these poles directly from its own tube works. In other words, purchasers secure them at "first hand" and directly from Pittsburg.

Rapid Drilling Machine for Manufacturers.

In the accompanying illustrations are shown a front view (Fig. 1) and a rear view (Fig. 2) of the manufacturers' rapid drilling machine made by the Pratt & Whitney company of Hartford, Conn. This machine has been designed to do very heavy drilling in steel bicycle-crank brackets, hubs, etc. The connection between the two rack pinion bearings and the table is such as to prevent the drill springing from the work. The oil pan surrounding the table permits the use of a large stream of oil to cool the drill and the work. The table has a vertical adjustment by means of a large screw, central with the spindle. The spindle is counterbalanced, has automatic feed and stop motion, and quick hand movement. It is driven by a large spur gear which

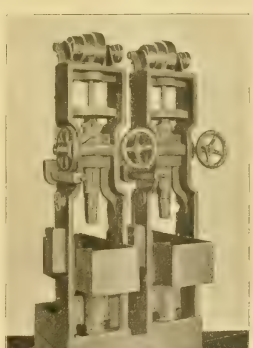


Fig. 1

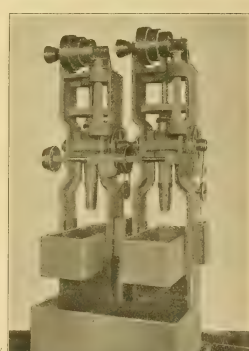

Fig. 2

RAPID DRILLING MACHINE FOR MANUFACTURERS.

slides on a long steel pinion driven through miter gears by the cone pulley. This is a better construction than the usual one in which the spindle is driven by a key over which it slides. The drill thrust is taken on a ball bearing containing three-fourths-inch balls. There are two feed racks on the spindle sleeve, one at the front, the other at the rear; they prevent the spindle springing to one side under a heavy pressure. The two rack pinions are geared together at the side of the frame and are driven by a large worm gear. The base can be made to take from one to four frames.

The machine will drill holes in diameter up to three inches; the number of Morse standard taper holes in the spindle is five. The dimensions of the table are 10 by 14 inches; vertical adjustment of table, 10 inches; greatest distance from end of spindle to table, 24 inches; feed movement of spindle, nine inches; diameter of spindle, 2¼ inches; number of grades on cone, 3; diameter of largest grade, 11¾ inches; width of belt, three inches; gear reduction from cone to spindle, 6 to 1.

The reputation of the Pratt & Whitney company for the production of high-class machine tools is international, and it is to be expected that this new drilling machine will form no exception to the characteristics of its output. The Chicago office of the company is at 42 and 44 South Clinton street. Mr. Charles E. Davis is the manager. The new machine is now on exhibition at that office.

Efficiency Tests on the Englewood and Chicago Electric Storage-battery Road.

[*Continued from page 79.*]

It is to be regretted that a profile of the road cannot accompany this report. The road, however, is practically level. The results of the last table would seem to indicate that in general the grade rose from the power house toward the two terminals.

The efficiency of the battery is shown as follows:

Kilowatt-hours, first charge..................36.757
Kilowatt-hours, discharge.....................19.715
Kilowatt-hours, second charge.................31.631

Efficiency, $\frac{\text{Discharge}}{\text{first charge}}$ .... 53.6 per cent.

Efficiency, $\frac{\text{Discharge}}{\text{second charge}}$ ....62.32 "

Efficiency average, 57.96 per cent.

The graphical log of the two charges is shown in Figs. 4 and 5, and it will be seen that they differ considerably. This is due to the fact that the charging of the battery was left to the regular operators of the plant, who used their judgment both as to the voltage and as to the time the battery should charge at each voltage. They also determined when the battery was fully charged. In the first charge there is no doubt but that the final voltage was too high, and in the second charge it would seem that the battery was charged too long, both of which conditions reduced the efficiency obtained. The result, however, shows the efficiency in actual service, but does not represent the possibilities of the battery.

The amount of the first charge was, of course, influenced by the immediate previous history of the battery, and for this reason the efficiency obtained by using the second charge as a basis is the more reliable. This test showed that the car used 1.41 kilowatt-hours per car-mile, as measured at the charging table, and .87 kilowatt-hour per car-mile was delivered from the batteries to the motor on the car.

IV. Acceleration Tests.

In the tests made upon a car in actual service no opportunity was afforded for accurate acceleration tests. These were made November 13, 1897, upon a straignt stretch of track along Vincennes road, extending south from the power house. In these tests the same instruments and observers as on the other car test were used, and readings were taken in much the same way, with the exception that in this test the observations were made at tne time of passing from one point to another of the controller. After the fifth point was reached the readings were taken at five second intervals. The time between points was obtained by means of a stop watch, and no effort was made to change the motorman's method of procedure in bringing the car up to speed. The average results of five trials are shown graphically in the curve, Fig. 7, which shows clearly the power delivered by the batteries at the different points of the controller and the energy required to accelerate the car.

The current curve shows a maximum of 320 amperes. It will be noticed, however, that at this time all four sets of batteries were in parallel, so that this total of 320 amperes indicates a total discharge rate of each cell of but 80 amperes. The dotted curve below the current curve indicates the actual discharge rate of the individual cell. At the fourth notch it coincides with the total current curve, and at this point indicates the highest discharge rate, which is seen to be 220 amperes, and this rapidly decreases until it reaches 100 amperes, which may be taken as a fair value of the current with the car in full motion. It is to be understood, of course, that the practice of coasting, in which the current is shut off, makes it impossible to obtain the power required per mile from this curve.

In conclusion it may be said that the foregoing tests do not demonstrate the best results that may be expected of accumulator traction, and were not made for that purpose. No excuse is to be offered for the fact that the road was not operating under ideal conditions while being tested, as the primary object of the test was to determine where improvements could be made. If this is kept in mind when comparing the results with those obtained upon the trolley systems of about the same size, it will be seen that the cost of fuel for accumulator traction of something less than one cent per car-mile, is very favorable to storage-battery traction. The improvements suggested by the test are now being made. The overhauling of the engines, the repair of the economizer flue and the securing of a better coal than was used on the test at a cheaper price, should bring the fuel cost per car-mile well within one-half cent. Figures upon the labor and maintenance factors in the cost per car-mile would be of interest in this connection, but are not covered by the figures of the test. The labor account will no doubt be as small as that of any nine-car road, while figures upon maintenance would be premature at this time. The batteries have operated from eight to fourteen thousand miles and are standing the service remarkably well, so that the maintenance account, up to the present, has been comparatively small.

Suspension of Railway Motors.

Following is the text of the decision of the United States Circuit Court in the case of the Sprague Electric Railway and Motor company against the Union Railway company and others upon the patent covering the suspension of motors upon street cars. The opinion was prepared by Justice Wheeler:

This suit is brought upon patent No. 324,892, dated August 25, 1885, and granted to Frank J. Sprague for an electric-railway motor consisting of a field-magnet journaled on the axle of the driving wheels at one end, and hung upon a spring from the truck or the car body, at the other, and carrying the armature shaft upon its pole-pieces parallel with the shaft of the driving wheels, and connected to them by gearing. The specification as to this arrangement says:

> The armature being carried rigidly by the field-magnet, these two parts must always maintain precisely the same relative position under every vertical or lateral movement of the wheels or of the car body; and as the field-magnet which carries the armature is itself centered by the axle of the wheels to which the armature shaft is geared, the engaging gears also must always maintain precisely the same relative position. At the same time the connection of the entire motor with the truck is through springs, so that its position is not affected by the movements of the truck on its springs.

The claims in question are:

> 2. The combination of a wheeled vehicle and an electro-dynamic motor mounted upon and propelling the same, the field-magnet of said motor being sleeved upon an axle of the vehicle at one end, and supported by flexible connections from the body of the vehicle at the other end, substantially as set forth.
>
> 6. The combination with a wheeled vehicle, supported upon its axles by springs, of an electro-dynamic motor flexibly supported from such vehicle, and centered upon the driving axle thereof, substantially as set forth.
>
> 9. The combination with a wheeled vehicle, of an electro-dynamic motor centered upon the driving axle thereof at one end, a spring support for that end of the motor from the truck or body of the vehicle, and relieving axle wholly or partly of dead weight, and a spring support for the other end of motor from the truck or body of vehicle, substantially as set forth.

This patent was before the Circuit Court of Appeals for the Eighth Circuit in Adams Electric Railway company versus Lindell Railway company, 77 Fed. Rep. 432, which was brought upon patent No. 300,827, dated June 24, 1884, and granted to A. Wellington Adams for improvements in electric motors, against structures made according to this patent as infringements. The position of Sprague's invention with reference to prior structures, inventions and patents is there well and comprehensively set forth by Judge Sanborn in the opinion of the court; and the decree dismissing the bill appears to have been affirmed because, in short, Sprague's invention was independent of Adams'. And if Sprague's patent was for merely hanging and centering one end of the motor of a carriage upon the axle of the driving wheels, and suspending the other by a spring from the body of the vehicle, or the truck, it would be shown from that case to be wholly lacking in novelty and void. He was not a pioneer here, and could have a valid patent for only what was new in his method of making the power of the electrical current turn the driving wheel. No one had before however, hung a field-magnet at one end upon the axle of the driving wheels, and at the other upon a spring from the body of the car, or the truck, and an armature axle upon the pole-pieces of the magnet, parallel with and geared to the axle of the driving wheels for driving a car by a current of electricity. This combination simplified greatly the required structures, improved their results, and came into immediate use. The invention of it seems to well support these claims of the patent.

The defendant's structures differ in some respects from those of the patent, but have all these parts working together in the same relation to each other for the same purpose, and producing the same result. They are altered by the addition of a joint in the motor, and of another spring to help carry it, but not by dispensing with any of the parts; they are improved upon but not departed from. The defendants' improvements are not made independent of and clear from Sprague's, but upon his; and his patent appears to be infringed by this taking of his invention to improve upon.

Decree for plaintiff.

Chicago Alley "L" Affairs.

Stockholders of the South Side Elevated Railroad company held their annual meeting January 27th. The election of directors and officers resulted as follows: President, Leslie Carter; vice-president, William Fleming; general manager, Marcellus Hopkins; secretary, John H. Glade; directors, George D. Boulton, T. J. Lefens, A. O. Slaughter, A. A. Carpenter, Byron L. Smith, William B. Walker, Joseph Leiter, C. J. Blair, Ebenezer Buckingham, William Fleming, Leslie Carter.

The net earnings for the 11 months ended December 31st were $121,943.19, or 1.18 per cent. on the capital of $10,323,800.

President Carter made a statement to shareholders in which he said: "The protective committee which had in charge the interests of the bondholders decided it would be best for the property to change its motive power from steam to electricity. We have not gotten on quite so rapidly as we expected in making the conversion, but have done the best we could. The track and equipment are completed, and the power house finished. One engine is installed, and three more will soon be placed. Out of the 120 coaches which are to be converted into motor coaches 75 have already been so converted, and the remainder are being changed at the rate of 10 per week. We adopted the Sprague system after two satisfactory tests, one at Schenectady, N. Y., and another on the Metropolitan elevated, where a train of five cars was very successfully operated for two months. Aside from the advantages of quickened acceleration, easiness on curves, and saving of time in switching, we believe the system will consume less current than other methods.

"The early part of 1897 was a poor period with us. Until October 18th we suffered decreases in traffic, largely due to the opening of the Wentworth avenue and Indiana avenue electric lines by the Chicago City Railway company."

On October 18th the use of the loop began, and from that time to the close of the year the daily average passengers carried was increased from 31,578 to 54,121. President Carter said that the cost of operating on the loop with steam had been unusually heavy, but inasmuch as the company had liberally advertised that its trains would operate over the loop and had gained thereby a large increase in traffic, it was thought good business to hold the patrons thus secured by giving improved service with steam until such time as electricity could be substituted. In the meantime the number of passenger coaches had been increased from 90 to 145. The number of car-miles run per month has increased from 320,000 to 500,000.

American Institute of Electrical Engineers.

The 121st meeting of the Institute, which was held at 12 West Thirty-first street, New York, on January 26th, was devoted to the discussion of the question of standardizing generators, motors and transformers. The discussion was opened by Mr. E. W. Rice, Jr., and was participated in by Messrs. Lozier, Kennelly, Wolcott, Hutchinson, Lieb, Dunn, Coho, Pattison, Henshaw, Steinmetz, Mailloux, Osterberg and Mosscrop. The appointment of a committee to consider the question was suggested and, subsequently, the whole matter was referred to the council for such action as it may deem proper.

At the meeting of the council in the afternoon the following-named associate members were elected: Charles R. Bangs, New York; M. C. Beebe, Madison, Wis.; Hugh Thomas Brown, Selma, Ala.; Edward P. Burch, Minneapolis, Minn.; Eben Clinch Crocker, Bridgeport, Conn.; Albert B. Elias, Thomas, W. Va.; Alexander Stanley Garfield, Paris, France; Chauncey Graham Hellick, Chicago, Ill.; Jacque L. Morgan, Kansas City, Mo.; Herman A. Prosser, Baltimore, Md.; John Joseph Swann, New York; C. Walton Swoope, Philadelphia, Pa.; Jin Tachihara, Schenectady, N. Y.

Tribute to Major Butterworth.

Patent attorneys and all who had business with the Patent Office at Washington entertained warm regard for the late Major Butterworth, and they will doubtless coincide with the views expressed by the acting commissioner, A. P. Greely, in the official announcement of the death of the late commissioner:

> We remember him as a kind, courteous, just and efficient officer—more as an affable, genial, and generous friend and companion than as a chief—an official who commanded the love and respect of all who came in contact with him.
>
> Major Butterworth's successful administration of the Patent Office from November 1, 1883, to March 23, 1885, is well remembered by those who had business with the office during that period, and the news of his selection by President McKinley to fill his old place of commissioner of patents was received with pleasure and satisfaction by all. His re-entrance into the office on April 13, 1897, was received with great satisfaction not only by the officials and employes of the office, but by the attorneys practicing before it. During his brief second term as commissioner he made many wholesome changes in the method of practice and had planned to put the office on a better basis and hoped by honest endeavors to broaden its scope and increase its usefulness.
>
> To honor the memory of our departed chief and friend, the employes of the Patent Office gathered together on the afternoon of the 17th inst., when suitable resolutions were adopted and brief remarks were made expressing the grief felt at his death and the loss to the office. A committee of employes of the office was appointed to decorate the church in which the funeral services were held.

New Cincinnati Edison Station.

Plans and specifications are now being issued for the building for the new generating plant of the Cincinnati Edison Electric company (of which John I. Beggs is general manager), at Plum and Charles streets, in that city. The structure will be 250 feet long and 100 feet wide. It will be built of brick and steel and is designed to be entirely fireproof. It will be divided into two sections by a longitudinal wall of masonry. The engine-room side will be one story high, while in the boiler-room division there will be two stories, the upper one being used for coal bunkers. Each side of the building will have a truss roof. The stack will be of iron, 16 feet in diameter and 200 feet high. The architects for the building are Elzner & Anderson of Cincinnati, and it is expected that the station will be finished by the end of July.

Nearly all the contracts for the machinery have been awarded. The initial equipment of engines will consist of four, supplied by the E. P. Allis company of Milwaukee. One will be of 600 horse power and three of 1,200 horse power each. All will be of the vertical, cross-compound, condensing type. The boilers (water-tube) come from William Sellers & Co. of Edgemoor, Del. There are six of them, of about 700 horse power each, some equipped with chain grates and the others with Hawley down-draft furnaces. The Southwark Foundry and Machine company of Philadelphia furnishes one Weiss condenser of 8,000 horse power capacity. This condenser is of a new design, brought out in Germany. A Green economizer of suitable size has been contracted for as part of the equipment. The dynamos for the direct-current Edison three-wire services are building by the General Electric company. Six machines, each of 200 kilowatts capacity, will be installed at present. They will be directly connected to the three larger engines and arrangement is made for extension by adding other generators as needed. Brush arc machines will be installed for the high-tension series circuits. The station is laid out for a capacity of 6,000 arc lights, but only a portion of the generating plant will be erected this year. The arc dynamos will be belt-driven from a shaft to which all the engines are connected. Bids are now being received for the switchboard and cooling towers. Sargent & Lundy of Chicago are the designing and consulting engineers.

Municipal Socialism.[1]

By Fred De Land.

Part I.

The mayor of Des Moines, a city having a population of 75,000, is the Hon. John MacVicar, who was recently elected president of the League of American Municipalities at the Columbus convention. Mr. MacVicar may yet play an important part in the political history of Iowa, for he possesses many of the attributes of the successful political leader, is a firm believer in the value of organized personal supervision in all campaign work and is ambitious to be re-elected the coming spring, not only because a second term may serve as a stepping stone to higher political honors, but because re-election would be a practical indorsement of his radical views that absolute power rests in the municipality to dictate at what rates and on what terms it may be served by corporations operating under a local franchise.

Naturally, the public-service corporations do not approve of such views, and are not in sympathy with his aims and his desires. But if he deals honestly with the taxpayer and does not degenerate into the demagogue; if he patiently and thoroughly analyzes the reasons that prompt his adherents to demand that certain changes in municipal expenditures be brought about, and then bases final action only on the facts as they are authoritatively recorded, his actions and his utterances may modify the plans of many an electric light, gas and street-railway manager in other cities. For there is little doubt that Mr. MacVicar is ambitious to play a more important part in the coming delusion of municipal socialism than Mr. Pingree ever dreamed of.

But to succeed he must be absolutely honest with himself as well as with the taxpayer. For in every city the heart of the voting element, like the heart of a woman, resembles a lithographer's stone—political destruction alone can efface what may have been written thereon in a moment of executive action. How is it possible for a man to deal honestly with the desires of his own heart when his mind is saturated with the pernicious and fallacious doctrines promulgated by the enthusiasts of the Arena-Parsons type, who believe that large semi-public service-supply corporations can easily be driven forth from a city and from a state whenever a few reformers so decide, unless the corporation submits to the whimsical demands of selfish dreamers. Mr. MacVicar may not know that one state and more than one hundred different cities have tried the experiment and that their citizens now mourn the loss of nearly every dollar invested in the game. Neither may he know that the leading property owners and manufacturers in a larger city than Des Moines are now bewailing the day that they subscribed to the delusive doctrines of a man who has saddled the city with a load that a decade of prosperous years cannot remove—a load that serves as a signboard to warn away investors.

So popular is Mr. MacVicar with a certain class of municipal socialists that his friends are questioning whether he, too, will cater to that unreasoning sentiment that impels the unthinking to blindly follow these self-elected reformers who rail at existing conditions and demand a change for partisan reasons only. Or does he already realize how capricious are the changing fancies of superficial and selfish reformers, and how unstable such support has usually proven to the politically ambitious? Enthusiastic as the advocates of municipal ownership may be in promoting the aims of an ambitious leader, let the thought once be impressed on their minds that the logical outcome of municipal socialism as practiced thus far has been personal inconvenience or personal financial loss to nearly every property holder or manufacturer in the city, either in direct taxation or in lessened values or in loss of profitable trade, and all enthusiasm will vanish.

Some of Mr. MacVicar's warmest friends already perceive how injuriously the city's commercial growth may be affected if word goes forth to capitalists that industrial corporations supplying semi-public service in Des Moines are not considered entitled to the legitimate returns that the public is always willing to grant investments in hazardous enterprises, even such returns as are properly referred to as "the manufacturer's profit." And these friends perceive how detrimental may be the reaction in sentiment when capitalists comprehend the true inwardness of the mayor's recent action in issuing an edict that the sum of $6.25 per month or $75 per year only shall hereafter be paid for each arc light of 2,000 candle power burning all night and every night in illuminating the streets of Des Moines, and that three-fourths of a cent per hour shall be paid for each 16 candle power lamp supplied for the use of the city.

For these friends know that the mayor was well aware that the average cost of producing an arc light in the largest and best municipal plants in the country was $85, not taking into question the matter of legitimate profits that naturally belong to a private corporation, or even certain local charges that a commercial company must always pay. Yet he deliberately set his seal of approval on an edict that virtually informs capitalists that rather than pay a reasonable profit to industrial corporations the citizens of Des Moines prefer either to deal unjustly where the capital is so invested that the company has no alternative but to accept the unreasonable offer, or else the citizens will lock up more than $100,000 in an experimental enterprise—that will prove an effectual barrier to the healthy growth of individual enterprises of like character.

The facts in the premises are as follows: For several years the city of Des Moines had paid the sum of $126 yearly for each arc lamp of 2,000 candle power used in street illumination. Soon after his election Mr. MacVicar started a movement to secure a more favorable contract for the city, and, to strengthen his claim for a reduction in rates, secured from various sources official data regarding prices paid by other cities for street illumination, and what the actual cost is where municipalities own and operate the lighting plant.

As there are three local lighting plants in Des Moines, several conferences were then held with a view to the city purchasing one of the three; but a prohibitory price having been placed on the property, negotiations ended and the mayor began to look elsewhere. Then the engineering firm of McCaskey & Holcomb made a proposition to build, and within six months from date the contract was signed for an acceptable modern lighting plant for a sum representing about two-thirds the actual cash investment in a local plant of similar capacity, as follows:

To build a lighting plant complete for supplying 500 arc lamps of 2,000 candle power and 1,000 incandescent lamps of 16 candle power, for the sum of $105,385; the city to furnish a suitable lot on which to erect the station; payment to be made as follows: $60,385 on completion of the plant; $25,000 one year after completion and $20,000 two years after completion, the engineering company to retain full possession of the plant until the final payment is made, and also to receive from the city the annual sum of $32,500, in equal monthly installments, for the period of two years, to compensate the engineering company for supplying 500 arc lights for all-night and every-night street illumination; this being at an average cost to the city per arc light of $65. The city also to carry during those two years not less than $20,000 of fire insurance on the station, and not less than $50,000 of tornado insurance on the entire plant.

The question of municipal ownership being submitted to the voters, at a special election, it was carried by a majority of 2,416 in a total vote of 5,176, and the proposition above outlined was accepted and the mayor authorized to sign and deliver the contract. At the previous regular election the total number of votes cast was 13,000, showing that less than one-half the usual number of voters felt sufficiently interested to cast a vote.

As the mayor was signing the contract a taxpayer endeavored to prevent his action, but being defeated, he then petitioned the courts for an injunction restraining the city from carrying out its contract. On January 17th Judge Bishop held the contract "to be invalid because it is different from that called for in the specifications and the published call for proposals."

But when the contract for lighting the streets at the old rate of $126 expired, the mayor issued an edict, based on the authority conferred in an ancient ordinance, that henceforth the city of Des Moines would only pay $75 per year for each arc lamp of 2,000 candle power used all night and every night for street illumination.

Admitting that $75 is a higher rate than the $65 which the engineering firm offers to supply the lights for, let us endeavor to ascertain whether the mayor was justified by the official records at his command in so arbitrarily fixing on $75 as a rate which the local lighting companies must accept.

The proposed cost of arc lighting in Des Moines, when the municipal plant is in operation, will be:

Contractor's charge, per arc lamp...........	$65.00
Insurance on plant, per arc lamp............	1.00
Sinking fund or depreciation, at five per cent., per arc lamp...........................	10.00
Total cost	$76.00

The last official report of the cost of street lighting in Detroit shows that the annual cost to the city of Detroit for each arc light of 2,000 candle power, burning all night and every night, was $89.42, while operating 1,600 arc lights out of a possible 2,000, the remaining 400 being held in reserve. This cost of $89.42 was the total of five items: Labor, $43.57; material, $20.62; depreciation, $1.85; interest, $18.28; taxes, $5.10. Depreciation is largely accounted for by maintaining the entire equipment in the best possible condition. But where complete replacement must ultimately follow, a depreciation charge of only four per cent. on first cost is entered. The total investment in Detroit is $714,843.76; a four per cent. interest charge on this equals $28,593.75; the assessed valuation is $427,500, calling for a charge of $7,981.43 for taxes.

The municipal plant in Allegheny City has been in service for several years and operates 1,100 arc lights of 2,000 candle power and nearly 9,000 16 candle power incandescent lamps. The cost per arc lamp per year is $74.32, divided as follows: Operating expenses, $53.55; interest charges at four per cent., $10.73; depreciation charges at three per cent., $8.04; taxes lost by city, $2. The cost of the arc plant was $259,258.43; of the arc and incandescent plants, $348,921, the city supplying the land. Included in the operating expenses per lamp, per year, were: Lamp trimming, $8; inspectors, $2; insurance, $1; coal, at $1 per ton, $10; supplies, $4.20; repairs to arc equipment, $5.50; office and miscellaneous, 30 cents; repairs outside, $5; labor at station, $7.50; salaries at office, $3.25; carbons, $5; total, $51.75.

Mr. Hunter, the gentleman in charge of the Allegheny plant, has publicly stated that, in his opinion, a fair price for commercial companies having overhead construction to charge for street lighting, where arc lamps of 2,000 candle power were in service for 4 000 hours, is $80 per year, where good coal costs $1 per ton; if coal costs $2 per ton, $90; and $100 if coal costs $3 per ton. If the circuits in the down-town district are underground, an increased ratio should be allowed to cover the interest on the increased investment necessary.

The facts regarding the Topeka municipal plant were officially reported in 1896 as follows: "The plant consists of a lot and building by a railroad switch, three boilers and three engines (worked to 235 horse power), six 30-light Jenney Indianapolis arc dynamos, six circuits with 24.72 miles of line and 33.5 miles of wire, supported on 943 30-foot poles, and 184 lamps of 2,000 candle power each, placed 1,100 feet apart one way and 800 feet the other. A test of 17 lamps showed an average pressure of 23.15 volts, and a current of 19 amperes equals 439.85 watts, or 1,953 nominal candle power. The lot and building cost $8,559.33; the plant, poles and wire, $46,888.65; total cost, $55,447.98."

In May, 1896, after less than seven years' service, the old machinery in the Topeka plant was condemned as wasteful, unsuitable and unserviceable, and was finally exchanged for modern apparatus at an additional cost of $13,772. And in making this exchange only $1,500 in trade was allowed for the old apparatus, which means a depreciation exceeding 10 per cent. per year.

The officially reported total "cost of operating the Topeka electric light plant," from November, 1889, to December, 1892, inclusive, was $54,240.95, or an average cost per arc lamp per month for 38 months of $7.75. The operating expenses are thus itemized, it being stated that "the best lump coal has been used, at an average cost of $2.75 per ton." Coal, $13,924.64; carbons, $2,981.31; globes, $235.80; oil and waste, $642.70; repairs, $4,847.57; insurance, telephone, etc., $1,329.96; pay-roll, $19,743.85; interest at six per cent., $10,535.12. The total cost to May 31, 1896, is $85,700.

In other words, Topeka paid during the first six years of municipal ownership, when machinery, circuits and lamps were new and in good condition, and cost of maintenance low, $93 per year for each arc light used in street lighting, not taking into consideration the extra investment necessary to replace old machinery, or the risk that attends all enterprises of like character, plus the loss of water rates, taxes, etc., which a private corporation would

1. Northwestern Electrical association, Milwaukee, Wis., January 26, 1898.

have paid. Moreover, there is $70,000 of the taxpayers' money locked up forever.

To recapitulate: The cost per lamp per year in the three most promising plants cited is shown to be officially reported as follows:

Detroit, Michigan	$89.42
Topeka, Kansas (moonlight schedule)	93.00
Allegheny City, Pennsylvania	74.32

Or an average cost of $85 per year per arc lamp.

These are figures that every practical and honest engineer would accept as showing the best that has been accomplished under the most favorable local conditions. For the economical administration of the municipal plant in Allegheny has always been worthy of commendation, even by engineers who could not approve of the low allowance for depreciation. And the commission of six citizens under whose wise administration the Detroit municipal plant was placed in operation, and who gave two years' services free of compensation in any form, was guided in all its deliberations by a chairman whose wide experience and practical ability in successfully solving vexed problems arising in large financial undertakings has been amply demonstrated in many ways. And this commission secured the services of a practical electrical engineer of established integrity who had designed, built and operated many electric-lighting plants under conditions differing in each case.

In view of these facts from official reports, and of Mr. Hunter's statement that where good steaming coal costs $1 per ton $80 is a fair price for commercial companies to charge for street lights of 2,000 candle power burning all night and every night, are not thoughtful investors in corporation properties justified in wondering whether this arbitrary action of the mayor in allowing only $75 per arc light supplied by commercial companies was simply a political stroke to gain the applause of unthinking voters? And are capitalists not justified in hesitating to invest a dollar in Des Moines? No state in the Union has a more intelligent population; few states so rich and productive as Iowa. Must all development be arrested for a term of years because a few men would sow the tares of municipal socialism in the hope that, through awakening a hatred of all corporations, they may reap certain political honors?

Discussion.

Mr. DeLand: Mayor MacVicar's official report showed that the cost of lighting in Topeka was only $48 a year, but a proper analysis showed that the actual cost was $93 per lamp, and that, too, without taking into account depreciation which really should be included.

Mr. Livermore: Is it not a fact that the president of the Detroit Municipal Lighting commission made a report, in which he stated that in his opinion he never believed nor had the figures borne out the facts that arc lights could be produced in that city for less than $102 per year? My idea is that this statement was made in a letter signed by the gentleman who, on his own authority, stated that he never personally believed that they could do it for less than $100, and the facts had borne him out.

Mr. Doherty: Two of the engineering clubs at the Wisconsin University had a debate on the advisability of the city of Madison operating its own electric-light plant. The boys on the negative side have tried to compute the depreciation of the plant; they separated the items, as buildings, machinery, etc., and classified them. Then they went to able authorities and secured their opinion on the life of that class of construction and the total depreciation figured up 8.3 per cent. Taking 8.3 per cent. depreciation charge and figuring interest at five per cent., I have made up the figures on the Detroit plant, and I believe they amount to something over $105 per arc lamp. As Mr. Dow has stated, Detroit is very favorably situated for coal and has everything in its favor, yet the cost figures up 59 mills per thousand watts furnished the city. I think if any of us will figure the cost on all night lamps we will find that we are not charging our municipalities as much as it costs the city of Detroit, and when you take the difference in the price of coal into consideration, you will find that the truth, as Mr Dow says, strengthens our hands with our city authorities. We are furnishing the city of Madison with 1,200 candle power lamps at 58 mills per thousand watts, as against 59 [illegible] Detroit, which, when you take into consideration the difference in price of coal, is really a much cheaper rate than is being given in Detroit.

Prof. Jackson: Depreciation is a somewhat complex question, and unless one has looked over one's figures and his books very recently, one is very likely to be somewhat at fault. But I bear this in mind that taking paying plants for the last 20 years and estimating their present value the depreciation is something atrocious—it is heart rending to the owner! On the other hand, if we consider the value on the basis of prices for machinery, etc., paid at that time, we have the proposition: In a town of from 20,000 to 100,000 inhabitants, if you consider buildings put up in the best manner, with all machinery, lines and appliances [illegible] leave out of the question changes [illegible] it is impossible I think, for anybody who has to do with commercial matters to figure that the depreciation is less on the entire plant than 7½ per cent. per year, unless a very large amount of repairs is put into the plant in the way of replacing outside construction and machinery every year; which is not ordinarily expected to be done and is not ordinarily done. I do not believe that the city of Detroit, even with its magnificently constructed plant, with underground conduits and excellent cables laid therein, in which the depreciation undoubtedly is much smaller than in any other class of outside construction, is justified in considering that it will not have to revolutionize the entire plant within 20 or 25 years; that is to say, it would take the most optimistic of men who has any acquaintance with electric lighting, commercial electricity and the improvements already made and those which probably will be made in the future in the manufacture of appliances, to believe that the Detroit plant has a right to expect to find its construction at the end of 20 years such that it has not got to be entirely revolutionized and a new plant put in as a whole. I am absolutely confident that there are no plants in the state of Wisconsin which have a right, under their present constrution, to write off less than 7½ per cent. on their value, and I doubt if there are many that have a right to write off less than between 10 and 15 per cent.

I think central-station men have been going at this question from an entirely wrong side of the house. I feel quite confident that Prof. Bemis and Prof. Parsons, for instance, and others who have agitated this question, intend to tell the truth, but they are making a mistake simply because they do not have a correct commercial training, and the only way to down the troubles that are facing the central-station men on account of this agitation for municipal ownership, is to have such organizations as this and the National Electric Light association, and possibly others, get together and persuade some man of national reputation in financial matters and national reputation for integrity and uprightness and truth, to examine into the accounts not only of the Detroit plant, the Topeka plant and the Allegheny plant, but to go into a number of other smaller plants that Mr. Bemis has reported upon from time to time. To affect the great public the electric-light men have got to get some man of national reputation for independence and integrity and knowledge of commercial matters to make the examination and report, and until that is done you may expect this agitation to continue, and your report, although absolutely correct, turned down.

CORRESPONDENCE.

New York Notes.

New York, February 2.—In the wonder and dismay over the Boston storm the troubles experienced by this town during the last week have been generally overlooked or disregarded. At any other time the damage sustained during the last week by the electrical interests of this section would attract general attention. The absence of overhead wires in the crowded downtown districts made such a disaster as that of Boston an impossibility here anyway. The operation of the underground trolley system is being narrowly watched, as it is recognized that much depends upon its performance this winter. It must be admitted that thus far it has behaved admirably, but of course it has not as yet been subjected to any such severe test as that which the overhead trolley in Boston experienced.

The syndicate which built the Nassau electric trolley lines in Brooklyn has secured control of the rights of the People's Traction company and the Westchester and Connecticut Traction company to build trolley roads east and north of the territory now served by the Union Railway company, and running out to Mount Vernon and New Rochelle. It was declared that the work of building these roads would be begun in May. At a special meeting of the two companies held this week W. A. Boland was elected president of each company, Silas B. Dutcher vice-president, and Fred C. Cocheu secretary and treasurer. Among the directors are John McCarthy, Joseph White and M. J. Kennedy.

P. H. Flynn, who is prominently identified with the enterprise, said yesterday that the companies had franchises to build 40 miles of road. Work, he said, would be begun first upon the line leading out to Mount Vernon on the Boston road.

Attorney-general Hancock has prepared an opinion informing State Comptroller Roberts that there was no manner in which the surface roads could be compelled to give to the Board of Electrical Control of New York city or to the state comptroller information relative to the mileage of undergound conductors operated by such roads. The comptroller submitted communications from Secretary Henry S. Kearney of the Board of Electrical Control and President H. H. Vreeland of the Metropolitan Street Railway company relative to the matter. President Vreeland claimed that his road is not "operating any electrical conductors in the city of New York that come within the purview of the acts of the Legislature establishing boards of commissioners of electrical subways, or that are within the jurisdiction of the Board of Electrical Control in the city of New York." The attorney general, in his opinion, says: "While it was evidently the intention of the Legislature to put companies engaged in the transmission of messages and light, heat and power under the authority of the Board of Electrical Control, it was never the intention of the Legislature to put street surface railway companies under the same control. This is demonstrated by the fact that the affairs of both steam and street surface railways in the state have long had the supervision of the State Railroad Commission, and that this commission has supervision and control of the railroad companies regarding changes of motive power."

The Fort George and Eleventh Avenue Railroad company of New York has filed with the secretary of state at Albany a certificate of incorporation. The company is to operate with power other than steam a road 1,500 feet long on the boulevard, or Eleventh avenue, this city, from Kingsbridge road to One-hundred-and-seventy-fifth street. The capital is $10,000, and the directors are John T. Little, Jr., D. S. Johnstone, Charles R. La Rue, Fred C. Garrick, Thomas Hanlon, Jr., and Harry J. Turner of New York city; C. M. Cumming of Yonkers, J. Howard Brouse of Mount Vernon, and Charles A. Gilbert of White Plains.

Professor F. B. Crocker has accepted the position of consulting engineer of the electrical exhibition in New York. Prof. Crocker regards the exhibition as a highly useful means of reaching the public. His name as consulting engineer is a guaranteee of good work being done under his supervision by the construction staff in the disposition and safeguarding of the exhibits.

An auxiliary and educational committee has been formed to take general charge of exhibition matters other than commercial, and to co-operate with the advisory committee which represents the New York Electrical society. T. C. Martin, who was chairman of the committee of the last show, has again consented to serve in the same capacity. With him are associated Prof. F. B. Crocker of Columbia University, Prof. Morris Loeb of the University of New York, Prof. W. E. Geyer of the Stevens Institute of Technology, Dr. Charles A. Doremus of the College of the City of New York, Herbert Laws Webb, J. B. Taltavall, Dr. Park Benjamin, G. H. Guy, W. T. Wheeler, Lieut. G. O. Squier, U. S. A., and Thomas A. Edison, Jr., who is in charge of some special decorative and mechanical effects.

Mr. Gould, the president of the Manhattan Railway company, has transmitted to the Rapid Transit commission a formal application for the connections, extensions and additional tracks and facilities desired by the company, but there is no mention of electrical operation in the application or the accompanying letter. It is understood that George H. Pegram, chief engineer of the Union Pacific railroad, who resigned recently to take the place of consulting engineer of the Manhattan Railway company of this city, will enter upon his new duties without delay.

On Sunday the Metropolitan Street Railway company began using its underground electric system on the upper section of the Ninth avenue line. For the present the cars are run from Sixty-fifth street through the boulevard to Seventy-second street, and thence through Amsterdam avenue to One-hundred-and-twenty-fifth street. The first cars were sent over the line at 10 a. m. The first two carried no passengers, and were sent ahead to see that the line about to be put in use was in proper condition. As soon as the two returned they were started back with a load of passengers transferred from the Broadway line. During the day eight cars were placed on the line, making regular trips with about 10 minutes headway. The speed of the cars, however, was slow, but the motormen stated that their orders had been to run slowly, and that a rate of 15 miles or more an hour could be easily attained. Transfers were given at One-hundred-and-twenty-fifth street and at Sixty-fifth street to the Ninth avenue horse-cars and the Broadway cable lines. As soon as the double conduits can be laid in Columbus avenue from Sixty-fifth to Fifty-ninth streets the cars will be run through to the East River by way of the Central Park, East and North River railway. The horse-cars in Fifty-ninth street will then be discontinued. President Vreeland states that he expects that by March 1st all cars north of Fifty-ninth street will be operated either by the underground electric system or by cable.

The running of the Amsterdam avenue cars through Fifty-ninth street will give a more rapid connection with the Second, Lexington, Madison, Sixth, Seventh, Eighth, Ninth and Columbus avenue lines of the company. M. S.

PERSONAL.

Clarence E. Stump, well known to street railway and electrical men, has severed his connection with the Electrical World.

Louis A. Ferguson, the general superintendent of the Chicago Edison company, will sail for Europe next week. Mr. Ferguson will be away five weeks and will give his attention to business methods employed in foreign cities, especially in England.

Mr. W. B. Scarf, who is the deputy minister of patents and also deputy minister of agriculture in Canada, is in Washington studying the patent system of the United States. The British ambassador introduced Mr. Scarf at the Patent Office on Thursday of last week.

Mr. Gustav Bissing announces that he has resigned the position of principal examiner in charge of Electrical Division A in the United States Patent

Office, which he has held for a number of years, and has formed with Joseph Lyons a copartnership for the practice of patent law.

Edward B. Ellicott has been appointed city electrician of Chicago under the new ordinance creating a Department of Electricity.

The Technical Club of Chicago has elected the following-named officers for the year: President, Robert W. Hunt; first vice-president, C. F. Quincy; second vice-president, Charles E. Billin; treasurer, James F. Lewis; directors, E. M. Hagar, J. W. Dickinson and James R. Chapman to fill vacancies, and Onward Bates, S. P. Wells, Jr., William Rhodes and L. A. Ferguson for three years.

T. C. Penington, who returned to Chicago on Monday from an eastern trip in the interest of the American Street Railway association, reports the outlook for the annual meeting at Boston, in September, as unusually favorable. An excellent hall in the building which will contain exhibits will add greatly to the comfort and convenience of visitors. Mr. Penington says there will be no question this year about ample floor space, as 65,000 square feet will be at the disposal of exhibitors.

Mr. Samuel Insull, the president of the Chicago Edison company, came home on Friday of last week, returning from a holiday trip to England. Mr. Insull found the outlook for the electrical industry in Great Britain to be good, the prospects of an active development in electric traction for the next few years being especially bright. Lightning, the English electrical journal, reports that Mr. Insull was entertained at a dinner given by several gentlemen interested in electrical undertakings at the Whitehall Club, London, on January 6th. Among those present to do honor to the guest of the evening were Philip Dawson, Sidney Dobson, R. E. Crompton, S. Z. de Ferranti, H. F. Parshall and R. F. Sellon. Mr. Insull described the up-to-date American practice in the central-station business, and gave a brief outline of the system of his own company. Remarks were made by Messrs. Crompton, Ferranti and others. The dinner was entirely informal, and was an exceedingly pleasant one.

ELECTRIC LIGHTING.

The American Loan and Trust company of New York on January 29th procured from Justice Dunwell an order directing the sale of the franchise and property of the Geneva Brush Electric Light and Power company. According to the press dispatches, "continued and united opposition of gas magnates and kerosene-oil dealers worked the destruction of the corporation. Although a city, Geneva will hereafter be lighted by kerosene."

The railway station and terminal yards and tracks of the Chicago, Rock Island and Pacific Railroad company and the Lake Shore and Michigan Southern Railroad company in Chicago are now lighted by current supplied by the Chicago Edison company. The current was formerly supplied from a private plant in the station at Van Buren and Sherman streets, but the engines and dynamos have now been discarded, and the load is carried by the central station. From dusk to daylight 2,000 candle power arc lamps are burned every night in the yard, and there are also from 800 to 1,000 incandescent lights in use. Probably the passenger elevator in the station building will be operated by electricity. At present hydraulic power is employed for the elevator. It is stated that the change from isolated plant to central-station supply was made to secure greater economy.

ELECTRIC RAILWAYS.

A bill has been introduced in the Assembly at Albany to compel street railway companies in cities of the second class to give passengers who are compelled to stand while a car goes five or more blocks tickets entitling them to another ride.

The St. Louis Star is making an effort to secure the benefits of electric traction for the terminal tunnel of that city. It says that as things are at present through there is a tunnel given a "flashlight picture of hell." It cites the example of the Baltimore tunnel, and urges that St Louis profit by the experience.

The Central Railroad company of New Jersey is said to be contemplating a project to connect its terminal in Jersey City with Jersey City Heights and the city proper by means of an elevated electric railroad. There is at present no way by which residents of the Heights or the city can reach the terminal except by going to New York and recrossing the river by the Liberty-street ferry, or else by being towed across a short distance in an odd scow. An old elevated railroad franchise which permits the building of a road from the Jersey Central terminal to the Heights has been secured by men representing the railroad company, and it is the intention of the promoters of the new line, it is reported, to extend the system to Newark, and ultimately to Trenton and Philadelphia. The new line will tap the most populous district of Jersey City, and, at the same time, provide a rapid route to the places it is proposed to take the line.

ELECTRICAL SECURITIES.

The Erie Telephone and Telegraph company has declared a quarterly dividend of one per cent., payable February 15th.

The Madison (Wis.) Gas and Electric company, in its comparative statement for December, shows net earnings of $6,465 against $6,097 for 1896 and $38,423 for the nine months of the fiscal year, as compared with $30,342 for the corresponding period of the year previous.

The Edison Electric Illuminating company of Brooklyn reports gross earnings for 1897 at $875,929, an increase of $65,663 over last year. The operating expenses for the same period were $480,717, an increase of $30,452. Interest and taxes amounted to $91,863, a decrease of $6,137, and the dividends $237,109, an increase of $12,109. The surplus is reported to be $79,327, an increase of $12,179 over that of 1896.

Preferred stockholders of the Pennsylvania Heat, Light and Power company are not satisfied with the proposition of the projectors of the deal to consolidate all the electric light companies of Philadelphia upon a basis of $15,000,000 bonds and $15,000,000 stock, to pay $35 per share of the stock with six per cent. guaranteed, as they claim that they should receive a prior lien bond bearing six per cent. interest for the $35, and then share with the common in the five per cent. bonds offered.

For the last seven months of 1897 the earnings of the Metropolitan street railway of Kansas City, which is controlled by Chicago capital, made a fine showing compared with those of the same months in 1896, as follows: Gross earnings in 1897, $1,171,876, in 1896, $1,082,970; operating expenses in 1897, $632,673, in 1896, 608,300; net earnings in 1897, $539,202, in 1896, $474,669. For the first 23 days of January, it is said, the company's gross earnings were $11,909 greater than for the same period in 1897.

The report of the American District Telegraph company of New York for the year ended December 31st shows gross earnings, $530,342; miscellaneous, $17,786; operating expenses and construction, $472,941; dividends, $76,882; deficit, $1,695; previous surplus, $54,713. The company holds the same stocks and bonds in the treasury as in the previous year, valued at $234,700. The company has 1,448 miles of wire in operation, 83 offices, and 29,553 instruments in operation. There were 2,521,935 messenger calls in the year, 4,307,537 telegrams were delivered, and 8,262,210 circular department deliveries. The cost of construction, maintenance, etc., has decreased 10 per cent., while the company's facilities and service have been kept up to a maximum of efficiency. Four new offices were added to its system, and 10 others, heretofore carried as branch offices, have been individualized.

MISCELLANEOUS.

City Electrician Edward B. Ellicott will give a lecture upon "The Fire-alarm System of Chicago" before the Y. M. C. A. Electrical Club, Friday evening, February 11th. The lecture will be illustrated with working apparatus, which will be in charge of D. M. Hyland. This will be the first of a series of practical talks which will be given before the Electrical Club by prominent electrical engineers.

Apropos of the German occupation of a Chinese port, it is stated that vast untouched beds of sheet mica lie within 50 miles of Kiao-Chow Bay. The extent of the mica deposits is as yet unknown, but they promise to handsomely repay those who are fortunate enough to obtain a franchise for working them. The rolling, sandy hillocks, under which the mica lies, are but poor land for cultivation, and hence their use for mining purposes detracts nothing from the cereal-producing capacity of the region. The mica crops out at intervals over some 50 square miles and in veins sometimes 10 feet thick. Of course much of it is discolored by foreign minerals, but it is believed that there are vast quantities of good commercial material

Acting on the instructions of the French minister of war, a committee of the Académie des Sciences has drawn up a report on the precautions to be taken in fixing electrical conductors in or near powder magazines. The committee makes no distinction between electric light and power conductors and telephone or telegraph wires, since all these may be exposed to lightning. The recommendations can be summarized as follows: All underground conductors for electricity, as well as gas and water pipes, should be kept at least 10 yards from the magazines. Aerial lines should be placed even further away—20 yards is recommended—and should be so arranged that they will not fall across the magazine in case of fracture. If light is required inside the magazine all wires are to be led in strong metal pipes, and then all switches and fuses, etc., controlling the lamps are to be placed outside the magazine. Only fixed lamps are permissible, and then they should be protected by a second envelope of glass. No voltages over 110 may be used. Any electric bells required in the magazines must be placed at least four yards from the powder, and the bells must be such as require very little current.

TRADE NEWS.

The Walker Electric company has taken a contract for building an electric railway in Kansas, starting from Leavenworth.

The Bernstein Electric company of Boston made an assignment on January 20th to General B. F. Peach, Jr., of Boston. It is the intention of the assignee to continue the business and fill orders as promptly as possible.

The St. Louis Car company has purchased the plant of the Union Car company near Baden. The former company, it is said, will remove its entire plant to the Baden property, expend $100,000 or more in improvements and increase the number of employes about 50 per cent.

The General Electric plant at Schenectady, N. Y., it is reported, is running day and night to keep up with the large amount of work on hand. The company's new fiscal year was begun February 1st, with contracts aggregating $14,000,000 and cash in the treasury of $2,500,000, it is said.

Hereafter the New York office of the Housatonic company, in the Postal Telegraph building at 253 Broadway, will be the main sales office of the company, to which all correspondence should be addressed. Friends in New York are invited to call and inspect the company's samples.

Frederick L. Merrill, now of Sipe & Sigler, Cleveland, manufacturers of the Willard storage battery, has been visiting Chicago. Mr. Merrill reports the landing of several fine storage-battery orders. Mr. Merrill recently resigned his position with Sipe & Sigler, and will act as general agent for them. His headquarters will be in Cleveland. Mr. Merrill is one of the most experienced storage-battery salesmen in this country, and he will doubtless do good work for his new connection.

Treasurer and General Manager L. H. Rogers of the Fort Wayne Lamp company of Cleveland is visiting Chicago. Mr. Rogers is much elated over the fact that his representative in Cook County, Martin J. Insull, of Sargent & Lundy, Monadnock block, has fitted up the new magnificent limited train of the Pennsylvania railroad with the Fort Wayne lamp. This will be a splendid advertisement for the Fort Wayne lamp, and the fact that this lamp is being used in the Pennsylvania railroad in its best train will be a decided feather, so to speak, in the company's cap.

Hugo Reisinger has moved his offices to 419-404-405-406, the Bowling Green building on Broadway, New York. These offices are located on the Broadway front, and are elaborately furnished. Mr. Reisinger has entered into contract with the Electra carbon, for which he has the exclusive American agency. The universal desire of users of carbons for arc lamps to secure an efficient service makes it important that the best carbons be secured, as it is a well-known fact that the question of excellence in dynamos and arc lamps counts but little when low-grade carbons are used.

President S. Swarts of the Swarts Metal Refining company of Chicago writes to the Western Electrician to say that the company is in no way connected with the Swarts Iron and Metal company, which recently sold out its business. "We are entirely on different lines," says Mr. Swarts, "and have at no time had any connection with them in any shape. Their name, being somewhat similar to ours, caused some confusion among the trade. We take this means of notifying the trade that we are still doing business at the old stand and are ready to fill any orders that may be entrusted to us."

The Gazetteer company, Cleveland, O., has just issued a directory of power plants in the principal cities and towns of the state of Pennsylvania. This book is gotten up in attractive form, contains a list of power plants in all municipalities with an excess of 5,000 population, together with the names of the manager, superintendent and chief engineer of the companies, and gives detailed information as to the power used, number, style and horse power of engines and boilers, number of pumps, dynamos, elevators, etc. It is also a directory of mechanical and consulting engineers, contractors and supply houses and other information of interest to power users and engineers. The book contains 250 pages, is handsomely bound in cloth and excellently printed.

The Sprague Electric company of New York has secured the contract for motors to be installed in the new works of the John Stephenson company, Industrial Elizabethport, N. J. This is a large and important contract, and some 48 motors will be utilized, ranging from three horse power to 40 horse power, mostly large size machines. The motors will be of the well known Lundell type, and will be direct connected, belted or coupled to the latest types of wood-working machinery. As is generally known, the Lundell motors are of the inclosed type and are admirably adapted for use in wood working machinery establishments where, of necessity, the atmosphere is filled with dust. Several large size Lundell direct connected exhaust fan outfits will also be included in the equipment. The plant will be one of the largest of its kind in the country and will be equipped exclusively with the Lundell motors.

BUSINESS.

Sipe & Sigler, Cleveland, O., manufacturers of the Willard storage battery, have recently filled orders for the Western Union Telegraph company for 120 Willard storage cells for Hoboken, N. J., 40 cells for Scranton, Pa., 30 cells for New Haven, Conn., 25 cells for Newark, N. J., and 343 plates for Ravenna, N. Y.

The '98 calendar of the Wagner Electric Manufacturing company of St. Louis shows the variety of the company's products. Motors, transformers, ventilating fans, switches, switchboards and other forms of apparatus are illustrated—a recent two-page advertisement in the Western Electrician being reproduced with good effect.

W. W. McChesney, Jr., representing Huebel & Manger, has started on his semi-annual trip through the West. Judging from the first few days' experience, the prospects are good for a successful and profitable trip. Reports from all parts of the country are encouraging, and Mr. McChesney believes that this year will be better than any preceding one, and he hopes to book many large orders for his firm before he returns.

There is no better railroad system in the Central states than the Big Four, with its lines extending from St. Louis to Indianapolis, Cincinnati and Cleveland, with through trains to New York; a perfect line, well ballasted and splendidly equipped from Chicago to Cincinnati and Louisville, making direct connections for all points south and southeast. The Big Four and Chesapeake and Ohio railways form the scenic line to Washington.

The New Standard open-circuit dry battery, manufactured by William Roche of 259 Greenwich street, New York, is having a large sale. The fact that Mr. Roche has had many years of experience in this class of manufacture eminently fits him to offer "the New Standard dry battery" as a strong competitor for honors in the electrical field, and his guarantee, which accompanies his product, would seem to satisfy the most exacting, as his claims for uniform strength are very broad.

The swinging tree insulator which is manufactured by the Western Electric company is a device which will be thoroughly appreciated by the central-station manager whose lines pass through trees. This insulator fully protects the lines from swaying branches without cutting the insulation, and is readily hung by a wire twisted through the hole at the top. This loop of wire can be lengthened and adapted to a wide range of conditions. A good time of the year to inspect line wire is just before the trees begin to bud and blossom, for at that time it can easily be seen how near the wires approach the limbs, and there are better opportunities for placing the tree insulator in an advantageous position when the view is thus unobstructed. These insulators can also be used to support arc-light wires when passing under bridges, awnings or iron roofs.

ILLUSTRATED ELECTRICAL PATENT RECORD.

Issued January 25, 1898.

597,782. Telephonic Installation. Georg Ritter, Stuttgart, Germany. Application filed June 11, 1896. Patented in Germany May 26, 1893, and in England August 4, 1894.

A feature of this invention is a connecting plug for insertion in the test ring, comprising a body of insulating material, contact pieces fixedly arranged upon the handle and insulated from each other, a movable contact ring arranged on the handle, and a spring for normally holding the contact ring in engagement with but one fixed contact piece, the movable ring adapted to be moved by the insertion of the plug in the test ring, so as to effect electrical connection between two of the fixed contact pieces.

597,785. Apparatus for Telephone Switchboards. Charles E. Scribner, Chicago, Ill. Application filed April 16, 1895.

The combination with a telephone line, of means for producing a signaling current in the line, and a relay in the circuit responding to such current, a local circuit including a subsidiary line signal controlled by the relay, an auxiliary helix on the relay in the local circuit, means for establishing connection with the line, and switch contacts actuated in the establishment of such connection adapted to interrupt the current through the auxiliary helix.

597,786. Telephone Circuit. Charles E. Scribner, Chicago, Ill. Application filed December 18, 1896.

Claim is made for a source of telephonic undulatory current and a receiving instrument therefor, in a closed conducting circuit, plugs being arranged in the line circuit and operator's telephone set having one side connected with the line circuit, and the test battery having one of its poles connected with an auxiliary circuit and a shunt through the restoring coil of the clearing-out annunciator to certain contact devices of one of the connecting plugs, the test battery having its other pole connected with the operator's telephone set as well as certain contact devices of the connecting plugs through the restoring coil of the individual annunciator in such manner that the connecting plugs when properly manipulated are adapted to establish the connections and automatically raise the indicator of the clearing-out annunciator.

NO. 597,786.

597,787. Apparatus for Telephone Switchboards. Charles E. Scribner, Chicago Ill. Application filed December 18, 1896.

Provision is made for means for determining the flow of current in the line during the use of the telephone, a magnet responsive to current in the line, an armature therefor, a secondary signal, and circuits including the secondary signal controlled by switch contacts operated by the armature, a second electro-magnet adapted to retract the armature, a circuit including the second magnet, and circuits closed to excite the magnet in the act of making connection with the line.

597,790. Electric Cable. Willoughby S. Smith and William P. Granville, London, England. Application filed November 1, 1897. Patented in England April 30, 1895.

An electric cable is composed of a tubular case inclosing a cylinder which is built up of two or more segments, and has a longitudinal central hollow air space, and also has one or more wires embedded in each segment.

597,799. Electric Railway. Eben C. Crocker, Bridgeport, Conn. Application filed April 23, 1897.

Two series of magnets are arranged in horizontally disposed couplets, the respective magnets of one series being in circuit with the respective alternate magnets of the other series when the circuits are closed, connections are provided between the terminals of these circuits and the line wire and sections, and suitable switches are operated by the magnets of each couplet for opening and closing the circuits in succession as the car advances.

597,816. Armature-winding Machine. Carl Eickemeyer, Yonkers, N. Y. Application filed October 30, 1897.

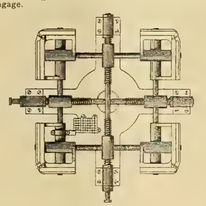
Four coiling plates are rectangularly arranged, and screws are operatively coupled to the plates, and proportioned so that one rotation thereof will move the plates from the position required for a coil of one size to one next larger or smaller, and stops which lock the screws in position after each complete rotation.

597,846. Manufacture of Storage Battery Grids. William W. [illegible], [illegible], Pa. Application filed November 22, [illegible]95.

In a sectional mold there is the combination with one section having a surrounding flange extending beyond its face, of a second section adapted to be received between the flange of the first section, means for moving the second mold section toward and away from the first section, and a receptacle below the plane of the mold communicating with the interior thereof for reception of the superfluous metal.

597,848. Trolley. George A. Hall, Portland, Me. Application filed February 6, 1897.

One claim is given: In a trolley, the combination with the curved roller stock, of the roller having an axle, the ends of which lie flush with the outer surface of the stock, spring plates secured to the stock to overlie the ends of the axle, and lugs with which notches in the ends of the plates engage.



NO. 597,816.

597,855. System of Electrical Distribution. Harvey Linton, Altoona, Pa. Application filed May 7, 1894.

A system of electric distribution is described, comprising a series of separated contacts independent of the track rails and arranged to be engaged by a traveling contact on the car, a main conductor having a branch conductor leading to each contact, a wire leading from the branch to the ground, and a magnet arranged to automatically make and interrupt the circuit through the contact to ground, and thereafter connect the main conductor to the contact.

597,880. Electric Furnace. William S. Horry, Sault Ste. Marie, Mich. Application filed April 16, 1897.

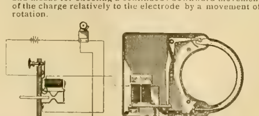
This furnace comprises the combination of a bottomless hopper, electrodes supported on the walls of the hopper, circuit connections for the electrodes, a rotatable receptacle arranged below the hopper and plates removably applied to the periphery of the receptacle.

597,891. Electrically Actuated Lock for Bicycle Racks. Frank V. Walstrom and John Erickson, Chicago, Ill. Application filed November 9, 1896.

There are a locking mechanism, an alarm mechanism, a relay arranged to control the alarm mechanism and a normally closed electric circuit arranged to control the relay.

597,945. Electric Furnace. Charles S. Bradley, Avon, N. Y. Application filed December 12, 1896.

A receptacle contains a charge of material to be operated upon; electric connections are made for leading a current through the charge from an external circuit, including a current-leading electrode extending into the receptacle, and means for effecting a continuous downward movement of the charge relatively to the electrode by a movement of rotation.



NO. 597,891.

597,964. Light Refracting and Magnifying Envelope for Incandescent Lamps. Forest W. Dunlap and John R. Quain, London, England. Application filed June 2, 1897.

A light refracting envelope is formed of a closely wound spiral of glass rod of circular or other section applied upon the bulb of the lamp.

597,965. Coin-controlled Machine. Henry T. Emeis, Salt Lake City, Utah. Application filed September 9, 1897.

Electric circuit-closing devices interrupt the coin in its passage and bring it into operation for closing a circuit, whereby an electric appliance located in the circuit is operated.

597,979. Electric Switch. Jesse L. Hinds, Syracuse, N. Y. Application filed February 1, 1896.

The switch terminals are secured to a base, and a blade is provided for closing the circuit between the terminals, and a back or support consisting of a slotted tube to which the blade is removably secured.

597,985. Electric Meter. Gisbert Kapp, Berlin, Germany. Application filed November 19, 1897. Patented in England April 7, 1892.

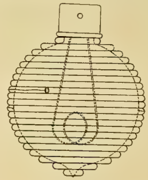
An electricity measuring apparatus has supplemental means adapted to give a separate registry or record of the consumption of energy during any desired period of the day, and means for throwing the same into and out of operation, whereby a registry of the current consumed during certain hours independent or distinct from that of other hours may be kept.

598,001. Electric Switch. James R. Newell, Titusville, Pa. Application filed September 15, 1897.

A pivoted bar of insulating material, conducting plates at each end of the bar, spring plates at each side of the bar having outwardly turned upper ends, a pin in the bar adapted to engage holes in the spring plates, and means for spreading the plates and depressing the bar.

598,033. Electric Signaling Device. Eugene A. Stout, Jr., Philadelphia, Pa. Application filed March 23, 1897.

Features of this invention comprise contact plates and conducting wires connecting therewith, a rotatable push-button having an arm adapted to be brought into engagement with any one of the plates, a bolt having one end projected into a bore in the button, and a spring mounted upon the bolt and performing the double function of holding the contact arm normally out of engagement with the plates and forming an electric conductor between the main and the contact arm.



NO. 596,964.

598,049. Electric Burglar-alarm System. Clyde Coleman, Chicago, Ill. Application filed December 14, 1896.

Two or more sources of electromotive force are provided; a responsive device is subjected to the influence of several sources of electromotive force; an alarm is adapted to be actuated by the responsive device; a multiple permutating device is associated with each of the sources of electromotive force, and means for operating the multiple permutating devices in unison to correspondingly vary the electromotive forces, and thereby maintain the responsive device quiescent, are described.

598,062. Device for Preventing Accidents on Railroads. Hermann Biermann, Breslau, Germany. Application filed April 6, 1896.

A current generator is arranged in the train, with a main-line circuit adapted to be put in electrical connection with the current generator and consisting of the rails of the track and divided in several fields by means of wires, a secondary line circuit comprising wires insulated from each other at the end of each of the fields, the circuit being put in the circuit of the main line, a secondary conductor on the cab connecting the terminal wires of the current generator and containing a resistance and the alarm and safety apparatus of the train, a contact device arranged at the end of each field and comprising a spring-lever adapted to connect the two wires forming the field, and an electro-magnet electrically connected with the main line and the secondary line.

598,063. Electric Burglar-alarm System. Clyde Coleman, Chicago, Ill. Application filed December 14, 1896.

A protective circuit and an individual circuit are provided, and a responsive device is subjected to the combined action of the currents flowing in the two circuits; an alarm is controlled by the responsive device, and a multiple permutating resistance for each of the circuits comprises a number of units of resistance and a plurality or multiple of circuit-changing arms or elements conjointly acting to include the units of resistance in various and successive orders.

Western Electrician.

EVERY SATURDAY.

Vol. XXII. CHICAGO, FEBRUARY 12, 1898. No. 7

Louis A. Ferguson Honored.

The Northwestern Association of the Alumni of the Massachusetts Institute of Technology paid a very pleasant and appropriate compliment to Louis A. Ferguson at the annual meeting of the organization in Chicago on February 5th by electing him president on the eve of his departure for Europe. There were a hundred members present at the meeting and the banquet which followed at the Chicago Technical Club, and the event was one of the most successful gatherings in the history of the organization. Frank Wells of the class of '70 was the toastmaster, and in taking the post he made a brief address congratulatory of the success of the reunion. The first address of the after-dinner series was delivered by Captain Andrew H. Russell of the United States army. He was graduated from the Massachusetts Institute of Technology in 1868. The subject of his speech was "The School and the Army." Other responses to toasts were made by George S. Morison, I. W. Litchfield and Severance Burrage. A feature of the evening was the discussion of the topic, "The Proposed Union of Technology and Harvard." The speakers were B. R. T. Collins, '88; Frederick Greeley, '76, and Solomon Sturges, '87. The executive committee which arranged the banquet consisted of: B. R. T. Collins, '88, president; R. H. Pierce, '85, vice-president; Edward M. Hagar, '93, secretary and treasurer; H. H. Cutler, '81; Solomon Sturges, '87; John L. Shortall, '87; Louis A. Ferguson, '88.

The Northwestern Association of the Alumni of the Massachusetts Institute of Technology was formed by the graduates residing in Chicago 11 years ago, and it has continued ever since adding constantly to its membership and influence. Mr. Ferguson, who was selected last Saturday to preside over the association during the ensuing year, was a charter member, and he has always displayed an active interest in the organization. The society numbers among its members some of the ablest engineers of Chicago and the Northwest, and the presidency is consequently looked upon as a very high compliment. That the present incumbent is deserving of this honor his associates in the engineering profession, especially in the electrical field, will testify.

Mr. Ferguson needs no introduction to readers of the Western Electrician. He is general superintendent of the Chicago Edison company, to which position he was appointed by President Insull on June 1st. He is an experienced central-station man and is one of the foremost advocates of that class of service as opposed to isolated plants, especially in the larger cities. He is especially familiar with the Chicago Edison company's plant and the conditions and requirements of that corporation's service, as he has been associated with the enterprise through the several stages of development and expansion that marked the period between the building of the Adams street station and the present comprehensive system. Mr. Ferguson is well equipped for his work by education and experience. He was graduated from the High School of Roxbury, suburb of Boston, in 1884, and immediately entered the Massachusetts Institute of Technology, where he completed his course and from which he was graduated in May, 1888, with the degree of Bachelor of Science in the department of electrical engineering. His thesis work at the Technology Institute consisted in original experiments to determine "The Law of Relation between Candle Power and Current, Voltage and Energy Consumed in Incandescent Lamps." It was about the time Mr. Ferguson was completing his engineering education that the original plans for the Edison system in Chicago were decided upon and the promoters of that enterprise were looking about for competent engineering talent to undertake the construction and operation of the plant. Mr. Ferguson's work at the Institute of Technology attracted favorable attention and he was offered a position with the Chicago Edison company in July, 1888. Shortly afterward he became electrician of the underground department. In 1889 he was made assistant electrical engineer in the construction department, and in 1890 was appointed electrical engineer of the company. Up to this time his experience had been entirely in the engineering department, but he displayed such good judgment in commercial work that was entrusted to him that his ability in this line attracted the attention of the management, and in 1893 his duties were enlarged and the securing of new business on contract basis, particularly among the large downtown retail establishments, was placed under his direction in addition to his engineering and construction work. His duties were gradually enlarged until on June 1st, as already mentioned, President Insull appointed him general superintendent of the company, giving him charge of the operating and electrical engineering departments, as well as the central-station and isolated-plant business.

Throughout his career in Chicago Mr. Ferguson has been progressive and yet conservative, and the experience that he has gained in the development of the Chicago Edison system has made him an authority upon central-station practice in this country. His contribution on "Central-station Advancement" in the Western Electrician of January 1st was accepted as an authoritative statement of

LOUIS A. FERGUSON.

present practice, and was appropriately supplemented in the same issue by an illustrated article on the "Three-phase Transmission Plant of the Chicago Edison Company." Mr. Ferguson was one of the staff of lecturers of the University of Wisconsin in 1895, and delivered a lecture on "Electrical Engineering in Modern Central Stations," which has since been published by the university. He read a paper at the meeting of the National Electric Light association at New York on May 5, 1896, on "The Commercial Value of Acetylene Gas as an Illuminant," giving the results of his experiments made with Messrs. Wilson and Knapp at Spray, N. C., in May, 1895, in the production of calcium carbide and acetylene gas. This paper was published in pamphlet form by order of the National Electric Light association, and comprises one of the ablest contributions on the subject up to the present time. Another valuable contribution was his work in connection with Dr. Louis Bell and James I. Ayer upon the preparation of a suitable specification for a standard incandescent lamp and the determination of a proper method for the commercial application of this standard. The result of this work was presented in a report on "Standard Candle Power of Incandescent Lamps" submitted to the National Electric Light association at Niagara Falls on June 16, 1897. At the convention of the Association of Edison Illuminating companies at Niagara Falls, September 14, 1897, Mr. Ferguson submitted an important contribution on "Economy in Distribution of Electric Energy."

Mr. Ferguson is still a young man, considering the responsibilities of his present position and the record he has made. He is not yet 31 years of age, as he was born August 19, 1867, at Dorchester, Mass, now a Boston suburb. Although a member of several organizations, Mr. Ferguson is not a club man, but in contradistinction may be termed a home man. He is happily married and enjcys a comfortable home at Evanston, Chicago's most beautiful suburb.

Chicago's Electrical Department.

The new Department of Electricity of the city of Chicago is now fully organized. Mr. Ellicott is city electrician, David M. Hyland assistant city electrician, William Carroll superintendent of construction, J. B. Porter chief clerk and R. M. Johnson chief inspector. The last-named gentleman is a 60-day appointee, and will take the civil-service examination. There are nine inspectors and the old force of operators. Now that a separate department has been created for the electrical interests of the city government, the inspection of electrical plants will be systematized to a degree not hitherto attained. Under the ordinance electrical contractors, rather than owners, must report all jobs of new or repair work to the department and must have a permit before beginning work. In this way a more complete record of the electrical installations in the city will be obtained.

For the present the Department of Electricity will remain in the old quarters, adjoining the Fire Department, in the city hall, but as the rooms are crowded and not well fitted for the work, it is likely that new offices will be secured on an upper floor of the building.

City Electrician Ellicott has outlined a policy for his department, and it has received the approval of Mayor Harrison. The principal features of this policy are the following:

"A continued careful investigation of the street railway systems and requiring correction of the faults causing damage to pipes by electrolysis.

"A rigid enforcement of the ordinance regarding the electrical inspection of wiring inside of buildings.

"The adoption of every means possible for the purpose of decreasing the cost of municipal lighting.

"The enforcement of ordinances relating to underground work to be done by the different electric companies, within a reasonable district.

"Putting all important fire-alarm and police lines underground.

"Requiring combination pole lines and removing the unnecessary pole lines.

"The extension of municipal electric lighting.

"Improving the police-telephone system and decreasing the cost of operation."

One of the planks in this platform is about to be enforced. That is the requirement about placing all electrical wires underground in a "reasonable district"—that is, the downtown business district bounded by the river, the lake and Twelfth street. In this portion of the city all the principal electrical circuits are now underground, but there are still a few aerial wires strung over roofs and across streets and alleys to make short connections. Most of these wires constitute the call-box circuits of the telegraph companies, but there are a few telephone wires, one city fire-alarm circuit and probably a number of "pirated" wires. By a recent order of the mayor all electrical wires of whatever description, in the district named, must be taken down by March 1st. The order meets general approval.

It is expected that the special appropriation of $150,000 for electric street lighting extensions by the city will be reported in the general municipal appropriation now under consideration. If this expectation is realized, Mr. Ellicott, acting under the city controller will carry out his plans for new arc-light plants as previously described in this journal. It will be remembered that a special extra appropriation for this purpose was made by the City Council, and that specifications were issued and bids received under this authority. However, Judge Tuley decided that the extra appropriation was illegal, and so action was deferred until the money could be made available as a part of the general appropriation for the city government

Practical Repair Hints.

By B. F. Fells.

Electrical machinery, like every other kind, will occasionally need repairing. At times when repairs are necessary the dynamo tender or other electrical machine worker usually discovers the value of suggestions and methods for quick and effective work, gained from the experience of others, or else he realizes that such help might have been of much assistance to him. Simple expedients and suggestions that may seem trite to some will perhaps still prove of value, and it is with this hope that I give a few "wrinkles" in shop practice that I have tried and found useful.

The commutator is often a source of trouble. In the small sizes the proportions enable the sections to be fairly well braced, as indicated by Fig. 1 in the accompanying drawing. In a large commutator, however, the circle described is of such dimension that the sections must necessarily be nearly parallel, as shown in Fig. 2. The result is that certain influences will cause one or more sections to drop down, as indicated by A, B and C. The mica will remain in position, and, of course, trouble will at once ensue. If but one section has dropped, and this not very far, the trouble may be remedied by grinding or sandpapering the mica and adjoining sections down to the common level. This will answer until the section drops again. If two or more sections drop I have always found it best to reconstruct the work, shaping and adjusting the insulation in such way as to obviate further trouble. In case of the short-circuiting of two sections, resulting in the burning out of an armature coil, use thicker insulation when reconstructing. If the brushes had sparked a good deal, use thinner insulation between the sections, as sparking is often a sign of too thick insulation.

In some types of motors the cams are keyed to the shaft. A case is in mind where one of these keys became loosened, and, to make it hold, the owner put a thin piece of tin (A) alongside, as represented in Fig. 3, in which B is the key. In driving the key home the extra thickness of tin caused the cam to break at the shoulder. The shaft and cam were brought in and the shoulder of the cam repaired, as illustrated in Fig. 4, in which the ring of soft steel, C, was tightly molded around the cam, as shown, and held in position securely by means of rivets. A new key, a trifle larger in proportion, was then substituted for the original key, and the job was complete. The rivets were, of

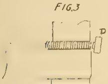

FIG 5

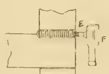

FIG 6

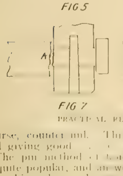

FIG 7

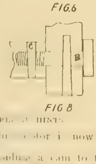

FIG 8

PRACTICAL REPAIR HINTS.

course, countersunk. The motor is now running and giving good . . .

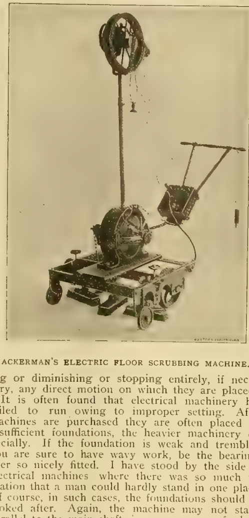
The pin method of holding a cam to the shaft is quite popular, and answers all purposes, but, like everything else in the machinery line, will at times give out. The repairer has frequently to contend with this type. In cases where the head of the pin, D, has broken off, as presented in Fig. 5, the difficulty is to get the remainder of the pin out. It is screwed in, as a rule, and sticks fast. About the quickest way to remove the broken piece is to bore two small holes in the end in which to insert a double-pointed instrument, as E, in Fig. 6. Then put on the wrench, F, and the broken pin may be turned out and a new one put in.

An unusual method of connecting the cam to the shaft is exhibited in Fig. 7, yet there are enough shafts of this kind to make it an object for repairers to be familiar with the most efficient process of effecting a repair in case of the shaft breaking off, as shown at A (Fig. 7). Even down the cam, bore a hole into it about the right size to receive a new shaft, such as is indicated by B in Fig. 8. The manner of securing in place, so that it cannot turn, is by inserting the key, C. This method of repairing these cam adjustments when they break off is lasting and satisfactory.

I have been asked about the differential motion which is now being adapted to certain electrical machinery. In this peculiar motion the driving shaft is the prime mover, and the arrangement of wheels is to modify, increase or diminish the direct motions. Its power of diversity of operation is that for two revolutions of the shaft on the prime mover the differential will give only one. For two revolutions of the shaft with the differential wheel held fast, the socket will revolve twice in the opposite direction. For eight revolutions of the shaft and one of the differential wheel the socket will revolve six times in the opposite direction to the prime mover, and for 200 revolutions of the shaft and 20 of the differential wheel the socket will revolve 160 times in the opposite direction to the prime mover. So it will be observed that this combination of wheels is capable of mofifying, increasing or diminishing or stopping entirely, if necessary, any direct motion on which they are placed.

It is often found that electrical machinery has failed to run owing to improper setting. After machines are purchased they are often placed on insufficient foundations, the heavier machinery especially. If the foundation is weak and trembles, you are sure to have wavy work, be the bearings ever so nicely fitted. I have stood by the side of electrical machines where there was so much vibration that a man could hardly stand in one place. Of course, in such cases, the foundations should be looked after. Again, the machine may not stand parallel to the main shaft, in consequence of which the belt crowds over too much to the fast pulley.

Much trouble has been caused by the overheated journals of fast-running electrical machines. That by far the greater number of such fires are due to the use of bad oils and negligence there can be little doubt. Bad oils and negligence make a fine combination for heated journals. Good oil and negligence are an improvement, but still not a safe combination. Much the best plan to pursue is to get rid of bad oils and negligence at the same time. By so doing much money will be saved and disaster prevented.



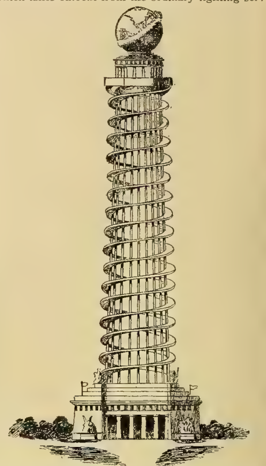
ACKERMAN'S ELECTRIC FLOOR SCRUBBING MACHINE.

Ackerman's Electric Floor Scrubbing Machine.

The labor-saving device which is illustrated in the accompanying picture has been found particularly serviceable in large office buildings and public institutions, department stores and places of amusement or wherever large floor space requires frequent cleaning. The frame carries several scrubbing brushes which are pressed against the floor by springs and are geared to an electric motor so as to be operated at about 400 revolutions per minute. The wheels have rubber tires, and the machine can very easily be shoved along the floor by its handle. It is found, however, that the action of the brushes in rotating tends to draw the machine along the floor, so that the operator has really little more to do than to guide it. When water is thrown on the floor and the scrubbing machine guided over it by the operator the work is quickly done. The front and the sides of the machine are protected by zinc splashboards. It is about 30 inches square and weighs about 300 pounds. The brushes are arranged so that the machine will run close to the baseboard.

The apparatus is operated by an electric motor which takes current from the ordinary lighting service through a flexible cord connection with any convenient incandescent lamp socket. It is only necessary to remove the lamp and insert the plug in its place. The reel at the top of the trolley pole takes up the slack cord. On the handle of the machine a rheostat is placed within easy reach of the operator. The gearing between the motor and the brushes is by means of a sprocket chain leading from the motor to the axle on which the larger wheels ordinarily loosely revolve, and from that axle by another sprocket chain to a shaft connected by bevel gears with vertical shafts operating the brushes. This allows the machine to be easily converted into a hand machine in case current cannot be obtained. It is only necessary to tighten set screws carried in the hubs of the large wheels which bind those wheels to the axle, and thus, when the machine is shoved forward by hand, the large wheels drive the brushes. Of course if the machine is constructed for use where there is no electric power, the motor and its attachments can be omitted altogether, and the connection between the axle and driving wheels made permanent.

In place of the scrubbing brushes, sandpaper blocks or blocks of stone may be substituted, and thus the machine may be used to dress down wood floors or mosaic. The springs always keep the brushes or the blocks in proper contact with the floor. According to the inventor of the machine, H. F. Ackerman of Cleveland, it has been in actual service for two years in the Hickox building in Cleveland, doing work on eight floors in 2½ hours which formerly took 10½ hours, thus effecting a saving of $75 each month. A machine has also been placed in Cleveland's New Lakeside, which is described as the largest and most modern hospital in the world.



ELECTRICAL FEATURE OF THE PAN-AMERICAN EXPOSITION.

Electrical Feature of the Pan-American Exposition.

It is intended that a great spiral railway operated by electric power from Niagara Falls shall be to the proposed Pan-American Exposition, to be held on Cayuga Island, Niagara Falls, what the Ferris wheel was to the World's Fair and what the Eiffel tower was to the last Paris Exposition. General plans for this conception have been made, and the details are being worked out. The basis for the railway is to be a huge circular tower of steel framework, 500 feet high, around which, like the thread of a screw, the spiral railway will run, supported on powerful brackets securely joined to the framework of the tower. The tower will have a diameter of 80 feet at the bottom, and the taper will be 30 feet to the 400-foot level, giving a diameter at that point of 50 feet. Around this tower the railway will run, rising 40 feet to the complete circle, thus passing 10 times around the tower in reaching the 400-foot

level, where there will be a platform which will be the terminus of the line. A ratchet rail will be used for the cars to make the climb, on the same principle as the ascent of the Mount Washington and Pike's Peak roads. The grade of the road will be from 17 to 25 per cent. Protective devices will be used to assure safety, and it is expected that passengers on the spiral railway will be better protected than those on electric or steam railway trains. When the passengers are ready for the trip they will be seated facing outward, away from the tower, and thus the view will grow better and better as the car ascends. Far away in Canada, up the river to Lake Erie, down to Lake Ontario, across one of the most beautiful sections of country to be found in the world, the eye will go with delight. The cars will never meet or pass except on opposite sides of the tower, as the two tracks will be erected on parallel but independent spirals.

At night the whole structure will be outlined in electric lights. Up and down the cars will move, glittering with incandescent lamps, while from the top of the tower a powerful searchlight will illumine the falls, rapids and the exposition grounds. Above this will, a great glass globe will shine with light from within, all going to form a never-to-be-forgotten spectacle. The design was conceived by George A. Ricker, chief engineer of the Gorge road at Niagara.

High Electromotive Force.[1]

By John Trowbridge.

I have lately perfected a large plant for the study of the discharges of electricity through gases which I believe is more extended, and on a larger scale, than any at present in existence; and I have obtained some results with it, especially in the subject of high electromotive force, which throw light upon many theoretical points. The source of electricity which produces the electrical discharges is obtained from 10,000 storage cells. From these cells I obtain very approximately 20,000 volts, and by means of a peculiar apparatus called Planté's rheostatic machine (Fig. 1) I am enabled to obtain over one million volts—which enables me to experiment with powerful discharges in air, more than four feet in length.

By the employment of storage cells in the subject of the discharges of electricity through gases, one can form a fair estimate of the amount of energy that is employed to produce the desired effects—for instance, the X-rays; while with the use of electrical machines or induction coils and transformers it is extremely difficult, if not impossible, to form an accurate estimate. Fig. 2 is an illustration of the type of cells of which the battery consists. Each cell is composed of a test tube 3½ inches long and three-fourths of an inch internal diameter containing two strips of lead which are separated from each other by rubber bands and are immersed in dilute sulphuric acid. The surfaces of the lead strips are roughened by a mechanical device, and the cells are charged in multiple circuit by means of a dynamo machine. When the cells are properly formed each one gives two volts and has an internal resistance of one-quarter of an ohm. The problem of insulating these cells was a serious one; but it was practically solved by mounting the cells in sets of threes, in holes bored in a block of wood which had been carefully boiled in paraffine. The mechanician of the laboratory, George Thompson, devised a simple switchboard which enables me to throw the cells into multiple or into series—to use the entire 10,000, or suitable portions of this number. The battery gives eight amperes of current with 20,000 volts, and this amount of energy is amply sufficient to kill a man. By accident an operator received the shock from only 1,000 of the cells and was badly shocked and burned. It is prudent therefore in experimenting with this battery to use rubber gloves, even in throwing the switches, and it is recommended to employ only one hand covered with a rubber glove and to keep the other hand in a pocket.

I had at first intended to use this large battery in the study of electrical discharges through Crookes tubes, but I speedily found that X-rays could not be excited by a difference of potential represented by 20,000 volts. I found that at least 100,000 volts were necessary to produce them strongly, and I, therefore, resolved to construct a Planté rheostatic machine. The machine is simply an apparatus by means of which Leyden jars are first charged in parallel and are then discharged in series or by cascades. That is, all the inside coatings of the jars are connected to the source of terminal of the 10,000 cells, and all the outside coatings are connected to the positive terminal of the cells. When the cells are charged, the inside of one Leyden jar is connected to the outside of the next, and so on. In this way a very high electromotive force can be obtained. I use 60 Leyden jars in the form of plates of glass 15 by 18 inches, coated on both sides with tinfoil. Starting with 20,000 volts, I can easily rise to 1,200,000 volts.

The mechanician of the laboratory has introduced a notable improvement in the apparatus of Planté. Instead of a revolving commutator such as was used by the latter, Mr. Thompson employed lever arms, by means of which the jars were first charged in parallel and then discharged in series. It was found that the apparatus designed by Planté could not be used for higher voltages than one or two thousand without serious error and loss. By means of this apparatus I can study electrical discharges at least four feet in length—of great body—which are produced by an electromotive force of 1,200,000 volts. This apparatus possesses the great advantage that it enables one to obtain a fairly exact measure of such high voltage. When we reflect that the trolley car employs only 500 volts, and in the system of transmission of power from Niagara Falls it is proposed to use only 10,000 volts, it is evident that the effects produced by voltages of over a million must be of great scientific interest.

The study of such high electromotive forces immediately showed that previous estimates of the electromotive force necessary to produce a spark of a certain length were highly erroneous. For instance, Heydeweiler, a German investigator, believes that Professor Elihu Thomson's statement, that a spark of five feet in length which he produced required a voltage of 500,000, is very wide of the mark, and Heydeweiler maintains that 100,000 would be nearer the truth. I find that even Professor Thomson's estimate must be more than doubled. Experiments with my apparatus show conclusively that the length of the electric spark between points separated more than one inch varies directly with the electromotive force. A spark 48 to 50 inches in length requires an electromotive force of 1,200,000 volts, and a discharge of lightning one mile long would therefore require the enormous number of over 100,000,000 volts. In reflecting upon the development of such enormous energy in the air we can understand why telephone bells ring during a thunder-storm, why subsidiary sparks occur in networks of wires and why telegraphic messages are interrupted. The world beneath the thunder-storm throbs and pulsates with the oscillatory discharges of lightning.

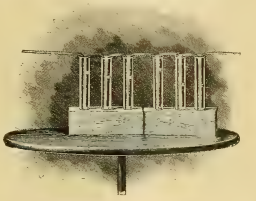


FIG. 2 HIGH ELECTROMOTIVE FORCE.—FORM OF CELL.

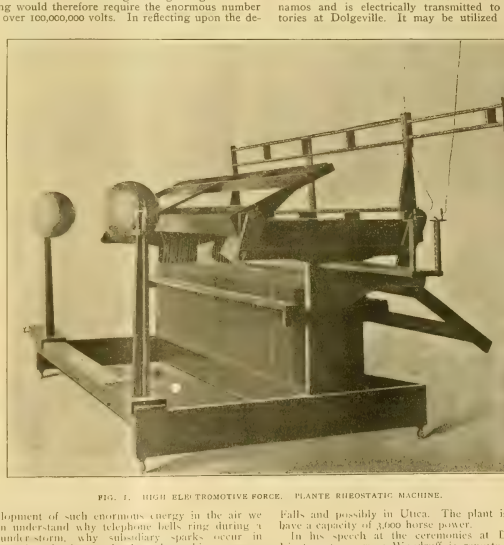

FIG. 1. HIGH ELECTROMOTIVE FORCE. PLANTÉ RHEOSTATIC MACHINE.

One of the most interesting results of my study of powerful disruptive discharges is the discovery that such discharges will pass through glass tubes which are exhausted to such a high degree that they are said to contain a vacuum; for the eighth-inch spark of a Ruhmkorff coil prefers to jump around the tube to passing through the extremely rarefied space in the interior of the tube. Such tubes, however, are brilliantly lighted by a difference of potential of 1,000,000 volts and readily show the X rays, and exhibit the skeleton of the hand in a fluoroscope. The so-called brush discharge from the positive terminal of the Planté machine extends visibly to a distance of over a foot. If the hand is exposed to this brush, it produces the well-known X-ray burn, such as various investigators have received in taking photographs of the skeletons of their hands, or in testing the condition of Crookes tubes by exposing their hands before a fluoroscope. The skin of the hand becomes irritable and turns a bright red color, especially after exposure to cold winds."

This result interested me greatly, for it proved that the so-called X-ray burn could be produced by the brush discharge of very high electromotive force. The extent of the influence of this powerful brush discharge is very great. For instance, photographic plates in a plate holder carefully insulated from the ground and covered with a plate of glass half an inch in thickness show the inductive action of the brush discharge from the positive terminal, which is distant at least a foot. These inductive effects are manifested by star-shaped figures on a photographic plate. They are surrounded by dark clouds. When the burn on the back of one's hand produced by such brush discharges is examined by a microscope, similar centers of disturbance (in this case points of inflammation) are seen. Although the Leyden jars of my machine are carefully insulated on supports of vulcanite which are mounted on dry wood, which in turn is supported on rubber, I can obtain a discharge of more than two feet in length when I bring a point connected to the steam pipes to the neighborhood of one terminal of the machine. The other terminal of the machine is carefully insulated. This experiment shows conclusively that it is of no use to insulate lightning rods. My experiments thus far show that no vacuum which I can produce can resist the discharges which are caused by 1,000,000 volts. It now becomes an interesting question whether there exists mechanical or chemical means by which a so-called vacuum can be produced which will resist such discharges.

Water-power Development in New York State.

The power transmission plant of the Dolgeville (N. Y.) Electric and Power company was formally opened on January 15th. The power of the East Canada Creek is used to drive turbines and dynamos and is electrically transmitted to the factories at Dolgeville. It may be utilized in Little Falls and possibly in Utica. The plant is said to have a capacity of 3,000 horse power.

In his speech at the ceremonies at Dolgeville Lieutenant-governor Woodruff is reported as saying that the Schenectady works of the General Electric company were to be operated by power electrically transmitted from the Hudson. Mr. Woodruff is quoted as follows:

"I come to you, not entirely in a public capacity, but as a manufacturer with business interests of a character similar to yours. One of the manufacturing plants in which I am interested is operated by water power, created by the largest dam in the state, the supply for which, like that of your dam, comes out of the forests of the Adirondack Mountains.

"Only a few years ago our people were startled

1. From the Scientific American.

by the announcement that the power of Niagara Falls was to be transmitted by electricity to the city of Buffalo. Almost before the sensation caused by the thought of such a possibility had abated Niagara was in chains, and her power infused into the arteries of a city which to-day is the second city of our state. Below the dam at Mechanicville, to which I have referred, a dam has just been completed across the Hudson River for the purpose of transmitting electric power to operate the works of the General Electric company at Schenectady. And now comes Dolgeville utilizing the rapid water of the Auskeraga and the erstwhile East Canada Creek to operate not only its own looms and spindles, but also the looms and spindles of Little Falls, and perhaps even the street cars of Utica.

"May it not be that the closing years of the nineteenth century have seen only the first steps in the application of electric power, and that the recent great water power developments to which I have referred are but the precursors of others, which will operate the manufactories of the Empire State, and even, perhaps, the surface, elevated and underground railways of the imperial city at the mouth of the Hudson?"

Electric Headlights on Western Railroads.

The electric headlight on locomotives has been found to have other uses than illuminating the track for the engineer and serving as a warning at approaching crossings. Throwing its powerful rays far into the darkness and silvering the forest foliage or the waters of lake or river, its beams are reflected upon the clouds as the engine takes a grade, and the coming of the train is heralded for miles in advance by signals that may be compared to the flashes of the heliograph from mountain peak to peak, long before the rumble of the train can be heard.

This has been noticed recently on the Monon Route in Indiana, more especially in the southern part of the state, where the line winds among the hills and is visible for short distances only, and where topographical obstructions form a barrier to the sound of the train. The line is a single track and is not provided with the block system, although trains are operated by telegraphic orders, and it becomes of considerable importance for engineers of freight and extra trains to know the whereabouts of trains approaching from the opposite direction, and for agents and flagmen at points where there is no telegraph. Actual observation has demonstrated the fact that the electric headlight telegraphs the approach of a fast train from five to eight minutes in advance of its arrival. This suggests the use of colored disks or other device to signal express or specials, and the use of the stationary searchlight for signaling at stations. It is believed that an excellent field is presented here for development. At any rate, the successful application of the electric searchlight upon western railroads has attracted the attention of practical railroad men throughout the country to the subject.

The apparatus employed is compact, the entire equipment being 26 inches long and 18 inches wide

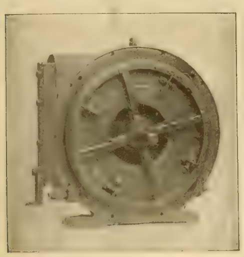

FIG. 1. ELECTRIC HEADLIGHTS ON WESTERN RAILROADS.

and the weight only 250 pounds. It comprises an engine, dynamo and lamp. The engine is a compound steam turbine and is exceedingly simple in construction. There are only two bearings, one 3½ inches long and the other 6½ inches. They are of the very best phosphor bronze, well provided for lubrication, and as the total weight of the turbine wheel, shaft and armature is only 42 pounds, it is clearly evident the life of the wearing parts will be long. It is explained that it makes no difference whether dry or wet steam is used, or a full head of steam suddenly turned on, as there can be no backlash or reaction and, therefore, no evil effects. The speed is 1,800 revolutions per minute, and a novel and ingenious governor regulates the varying load to a degree of perfection seldom equaled in any engine. It is attached directly to the turbine wheel and is designed to run without oil. The speed can easily be increased or decreased by removing a plug in the name-plate and tightening or loosening the screws immediately beneath. A view of the turbine with the cover removed is presented in Fig. 1. The same simplicity of design and arrangement was followed in the dynamo as in the engine, as will be seen by reference to Fig. 2. The armature is mounted on the engine shaft, thus dispensing with couplings, and can be easily taken out by removing one screw. The brushholders are fixed and the brushes can be removed or replaced without changing the tension of the spring. The particular claims for the lamp are

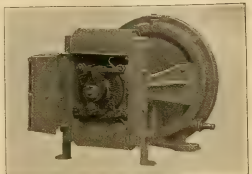

FIG. 2. ELECTRIC HEADLIGHTS ON WESTERN RAILROADS.

simplicity and durability. It is said to be the first lamp to use successfully two carbons on the locomotive, holding the focus accurately. It is provided for adjustment in every direction and is so constructed that any degree of light up to its full capacity can be maintained by regulating the flow of steam. An excellent idea of the mechanism of the lamp can be gained from Fig. 3, and the mechanical details of the outfit will be better understood after an examination of the diagram presented in Fig. 4.

The Pyle National Electric Headlight company of Chicago, which manufactures these headlights, has already equipped trains on the Monon, Big Four and Santa Fe, and reports from the operating departments of these roads indicate that satisfactory results have been attained.

Cabby's Farewell.

[From the St. James Gazette, London.]

So long, old 'oss; you're jest played out, you've taken your last fare,
Your quarters are the knacker's nah, and mine are Lord knows where;
There ain't no room in London nah for either you or me,
We're crahded aht by cabs as go by electricitee.

It warn't all beer and skittles, even in the palmy days,
What with the cove with principles, his legal fare as pays;
But when the "biz" was pretty brisk, and cabby got the pull,
I could plank dahn for the Derby for my fancy arf a bull.

It's nuts, it is, on some fine day, to pick up some young nob,
And drive 'im all the morning till the fare is nineteen bob;
And then he stops at Gresham 'Ouse, and shahting, "Cabby, wait,"
'E takes 'is 'ook the other end aht into Bishopsgate.

Or on a lovely autumn when the rain came dahn in sheets,
Or when a bloomin' blizzard set us skatin' in the streets,
And after you 'ad planked dahn to the yard each bob you 'ad,
And fahnd yerself to balance up a dollar to the bad.

Then to take yer to the stables at the other end of tahn,
And strip yer frozen 'arness off, and rub yer ole 'ide dahn;
And yer got yer jolly skin full, and a decent place to doss,
Which was often more nor *I* got by a jolly site, old 'oss.

But nah—so long, my beauty; for this latest style I bar—
I ain't a going (what do *you* think) to run a motor car;
While there's a crossing to be swept, a job to do no fear—
I reckon I'm too old to turn a bloomnig engineer.

A Discouragement to Business.

"How does the horseless carriage business progress?" asked the inquiring customer of the Irish proprietor of an automatic carriage establishment.

"Sure, there's times it progresses fine, sorr, an' there's times it don't progress at all," replied the proprietor. "Whin the cabs is in order an' goes whizzin' around the strates widout noise or commotion folks looks at 'em wid special admiration an' says: 'Ain't thot a divil av a fine way to get over the ground!' But, sorr, av you'll take my wurrud for it, 'tis a powerful discouridgemint to the business to see t'ree big micks pushin' a played-out automotor out Broadway in the opin face av Hivin an' the interisted pooblic, an' advertisin' the catastrophe be shwearin' thimsilves blue in the fayess at ivery step. A powerful discouridgemint to business it is, an' av it don't stop happenin' on a sinful average av wance a day, I'm goin' to sell out an' go into the perpetuous motion business."—New York Sun.

The Antiquarian City.

In Any Western City.—Little Willie—Mamma, I got so many toys and things at Christmas I don't know what to do, and would like to see something real wonderful.

Mother—Well, my boy, if you are very good we will soon take you to New York, where you can see a horse-car.—New York Tribune.

Municipal Socialism.[1]

PART II.

Mr. Thayer: I have in my hands a batch of 17 reports, such as they are—I should not call more than two of them real reports—from the municipal plants in the state of Iowa. Six or eight weeks ago I was written to by the secretary of a syndicate of eastern capitalists who were about to lose the city service in Tonawanda, N. Y., on the ground of the excellent showing of the Marshalltown plant, which was alleged to be furnishing arc lights for $18 a year. Now I have out of that list three or four reports that are sufficiently explicit so that we can draw some deductions from them.

Among the best of them is the plant belonging to the city of Vinton, a county seat of about 3,000 inhabitants. It seems that this plant was started in March, 1896, to run in conjunction with a water plant which had been running for some time. The original cost of the lighting plant was $12,380. It was installed by the Fort Wayne corporation. The cost up to date is $18,000. I understand that some of the cost is attributable to the fact that they belted their alternating dynamo direct to a Corliss engine and afterward had to tear their engine room all to pieces and put in a countershaft. According to the report the operating expenses were coal $1,400, labor $1,455, repairs $75, other expenses $250, total, $3,200 per year; income from their lights, $3,600. The incandescent lights are all on meters; they charge meter rent; there is a rate of three-fourths of a cent an hour, and I think that bills amounting to over $5 a month are discounted 15 to 20 per cent.; so that their rates are no lower than those of the ordinary commercial plant. Now they are making $400 over operating expenses; the plant to-day has cost $18,000. This plant is run in connection with waterworks, and the cost of the latter figures out about $2,400 with an invesment of $40,000. Now the fixed charges, with five per cent. interest on this plant, are in the neighborhood of $2,000, making the total cost of operation $4,400 per year.

Now in a town of somewhat similar size, Marengo, same amount of wealth and same class of people, they pay for their service $600 a year, and the electric light company furnishes the coal and labor for a waterworks pump.

In the town of Lisbon, there is a Fort Wayne alternator of 90 kilowatts capacity. According to the last reports they are running behind $125 a year. The cost of operating last year was $3,125, and the income was $3,000. They have an investment there of $15,000; and figuring six per cent. interest and 6½ per cent. depreciation, which is certainly low enough, we find that their arc lights are costing them $1,500 per year for 13 midnight arcs; that is over $100 a year. We are furnishing at the same time 18 all-night arcs of 2,000 candle power

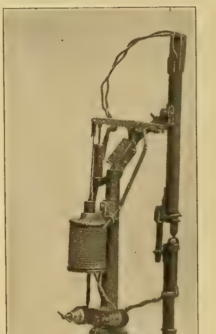

FIG. 3. ELECTRIC HEADLIGHTS ON WESTERN RAILROADS.

for the same money that Lisbon is furnishing 13 arcs.

Here is the Marshalltown report, under the signature of the city clerk. The plant started in 1887. Its original cost was $12,000. They have 68 arcs of 1,200 candle power each, one 80 horse power engine, and the coal cost them $1.27. The clerk says: "This plant is operated in connection with the waterworks plant; the cost of plant is $12,000 for dynamo, two dynamos of 32 lights, 1,200 candle power

each; annual operating expenses have not exceeded $1,200 per year." As near as I can figure that out the plant is operated in connection with the waterworks and it charges the cost of the trimmer and arc light repairs to the waterworks company. I had the editor of our local paper write him and he never answered, and three or four days afterward we wrote him and inclosed an envelope with stamp and he wrote a very long letter in which he stated that he was very sorry that he could not give the necessary information on account of the lack of time, but he advised the editor to come up and see Mr. Pierce, the mayor, and Mr. Pierce would be delighted to show the plant and explain the merits of municipal lighting.

Now the conclusion I want to draw from this is that the city officials of these smaller plants are business men and not electric-light men, and, while they are honest in their intentions, they do not know what their business is costing them, and when they send out reports like those it conjures every plant in the vicinity, because the cost of light is reported as being low and citizens say the light costs us about double what it should, and something is wrong, prices ought to go down. It is our duty, I think, wherever there are any municipal plants anywhere near us to visit them, or get somebody who knows something about it to go there and get the actual operating expenses.

Mr. Pearce: The city of Negaunee has put in a plant. It was installed by the Fort Wayne company. This plant has now been run since the first of September, and they have burned their year's supply of coal in less than four months, which illustrates the value of the figures some of these municipal engineers get out. The estimate for putting in that plant was to supply one alternator of 1,000-light capacity, a 65-light arc machine, and the necessary line construction, for about $10,000. The bids were received and, of course, the Fort Wayne company got it. The amount bid to put in the plant was $9,974; but the extras, etc., I have heard the mayor say, brought the cost close onto $18,000, and they had not finished putting it in yet.

Mr. Debell: We see in most of these figures submitted by municipal plants that the figures are always given in round numbers; they say the expense in this direction is not over $700, while the income is just an even $3,400 and the payroll $1,400. It creates a suspicion in my mind that these sums are all lumped and that there is no actual bookkeeping or accounting embracing any such figures at all. If they do any bookkeeping at all, they should know the cents as well as the dollars. I do not think any private individual would keep a bookkeeper 24 hours whose accounts all came out even hundreds, twenty-fives or fifties.

Mr. Trott of Big Rapids, Mich.: At Holland, Michigan, in March, 1894, they had in operation a 750-light alternator and a 50-light 9½ ampere arc dynamo running 41 street lights. When they raised their money to build this plant they raised $12,000. When they turned it over it stood them in hand $15,000. On the first of October following I went to the city and took charge of this plant, running there a year. Previous to that there was an Edison company operating a three-wire system there, which never had any street lights, and the people thought that the Edison rate that was being charged was terribly high. I believe their highest rates for all-night service for a 16 candle power lamp was $8 per year. The service was deemed defective in some ways, and the city said that inasmuch as the Wolverine company charged $8 they would put in their plant and cut the price in two. So a plant was built for them. In December the attention of the board was called to the fact that their machine was carrying about 900 lights at those rates, which was its full capacity. At the spring election they asked for a further issue of bonds of $10,000 to extend the plant. They got their $10,000 and paid the Wolverine company $6,000 cash for line, dynamos and one large boiler, leaving them with two engines on an investment in hand them in hand over $18,000 cash. Then they got the whole thing and said we are doing this too cheap, and put the rates up, and they closed all night rates to $12 a year, and meter rates to 6 of a cent per hour per lamp. The board of public works estimated that in running 41 street lights at 12 o'clock moonlight schedule, it was costing them $60 a year for each light, when everything possible was charged to the water department. The press-ure time the amount of bills allowed by the board on account of this electric lighting plant, including labor, fuel, supplies and repairs, taking into consideration the city marshal's report as to collections every month, still showed that they are running behind. Their great earnings do not materialize.

At Grand Haven there is another plant in practically the same condition. A few people there, through personal spite, worked up a deal to put in a plant. Now, Grand Haven owns a plant of its own. The other plant is shut down, and the city plant is run about half the time.

In Big Rapids they have a fight on, too. We have the lowest rate in the country and have had for three years. A short time ago it was charged that we were not furnishing what we contracted to do, so they decided to make a test. They sent to Detroit and got a couple of so-called engineers, who came up with voltmeters, went to the station, read an ammeter on the circuit, lowered one lamp, read that lamp for five hours, found that it averaged 403 watts, and then they went back to Detroit to get information to enable them to write their report!

Then the mayor of the city appointed a committee to ascertain the cost of building a city plant for 50 arc lights, distributed as they are now required, through 15 miles of circuit. The committee consisted of inexperienced men, who reported, after asking a few parties what they could do, that they could build this plant for $5,000 and put it in operation with a 50-light outfit complete. Then the mayor came out in a statement that he could build it for less than $5,000, and now he proposes to start a plant running for $7,000, operated on a moonlight schedule, to furnish light for $700 a year for 50 lights, and on an all-night schedule for over a year. We have tried to do business with the city of Big Rapids, offering them very low rates, but now we have got to accept their figures or they will put in a municipal plant.

In regard to Bay City, it may be said that it had an old Fort Wayne Jenney plant giving very poor service. Every time a thunderstorm came up it was shut down, and when oil and waste were needed a messenger was sent over to the waterworks department, where he got it free of expense. They threw out a while ago all their old machinery and put in a new outfit; but they did not charge that up to the expense of operating; no, that was impossible!

Right north of us, 16 miles, is Cadillac, and they will soon have a municipal plant there.

Mr. Ralph: I have had no trouble in Owosso, but the little town of Corunna, to which we also furnished some arc lights, has given us some trouble. I made a contract with the latter place some time ago, for five years, and after that contract had been in existence less than a year they elected a new council, which wanted to break the contract and eventually did so. That contract was $50 a year for 22

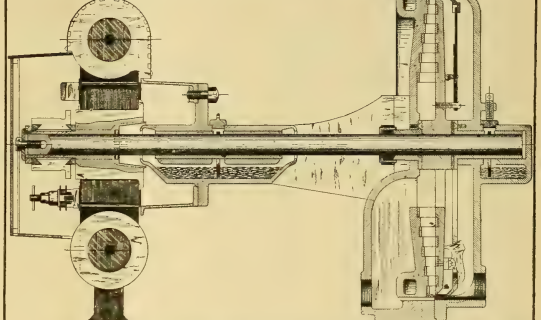

FIG. 4. ELECTRIC HEADLIGHTS ON WESTERN RAILROADS.

lights. Now, those were 1,200 candle power lights, and I had quite a number of letters written to me, asking me why I made such a low figure, but I have a street railway running over there, and my excuse is that it was at some advantage to have that town lit up at night on account of the railway; consequently I charged up $10 a light to the railway account, making the same price that I was getting from Owosso, $60 a year. After a while this contract was broken and they did not pay me for lights, but they made a settlement on a $60 basis, and went along for a couple of months and eventually had the lights shut off. Now after they had done that they had an election, and it took a two-thirds vote to bond the city to put in a municipal plant. They lost the election—they did not get a majority on the vote. After that they concluded they must make some arrangement with me, and the council drew up a very nice contract, in which they offered me $42.50 per year for lamps. After that an irresponsible person came along and claimed that he would accept the contract if they would give him a franchise. Then they had a meeting in which they passed an ordinance giving him a 30-year franchise and a 10-year contract at $42.50, but although two months have elapsed the plant has not been built nor has the contract been accepted.

New Weston Enterprises.

From a recent issue of the News of Newark, N. J., the following interesting announcement is taken:

"Besides the Weston Electrical Instrument company, a number of other concerns in the same line of business will, it is said, in the spring locate their factories near Waverly. These others are the Weston General company (capital, $2,000,000), the Weston Electric Appliance company, (capital, $750,000) and the European Weston Electric Instrument company, which manufactures for the European market and is capitalized at $200,000. The South Newark Land and Improvement company, with a capital of $50,000, is also interested.

"This project, when completed, will form a colony of electrical factories, and the army of workmen employed therein and housed in the immediate neighborhood will ultimately, it is thought, constitute a little town.

"Edward Weston, the electrician, is at the head of the undertaking. The Weston Electric Instrument company, which has its headquarters at William and Shipman streets, Newark, has grown so rapidly in recent years that its present factory was found to be too restricted for its needs. A plot of ground was purchased some time ago on Frelinghuysen avenue, near Waverly, with the intention of locating new works there.

"An especial inducement was found in the fact that in that immediate neighborhood a water supply of 3,000,000 gallons a day could be relied upon, a most important consideration in choosing a site for the company's purposes.

"The plot has a frontage of from 1,600 to 1,800 feet on Frelinghuysen avenue, and runs west along the old road to the tracks of the Lehigh Valley railroad. Besides that property, the company also came into possession of a strip of land running east from the Waverly Hotel to the Pennsylvania railroad station, besides one or two adjoining tracts. It is here that the electrical industry will construct its various works and its homes for the employes."

Municipal Ownership in Milwaukee Politics.

A new factor has appeared in the politics of Milwaukee. In announcing his candidacy for mayor, Henry J. Baumgaertner positively declared that, should the question of municipal ownership be ignored in the Republican platform, he would not accept the nomination, even if offered to him by acclamation. To make a municipal ownership pledge in the platform would mean for the party to promise to increase the bonded indebtedness of the city, which has already reached its constitutional limit, and such a promise could not be carried out. The increase of the city's debt is a precarious question, which recently was ventilated in a local court, and later in the Supreme Court of the state. The garbage bonds were declared illegal and had to be canceled before sold, and, it is believed, all other new bond issues may meet the same fate.

Where American and English Practice Agrees.

[From the London Electrical Engineer.]

Litigation has absorbed too much of the profits arising from electrical engineering, and we regret to note that the present year is not likely to be free from expensive patent-law disputes. The meter patents will be responsible for at least two big battles, which will take away from their ordinary business much of the energy of the firms involved. Another fight is likely to arise over the enclosed arc lamp patents. The broad principle of burning an arc in an enclosed space is free, but the details of how to do this are patented, and infringements of these patents threaten to result in law proceedings. This we regret, as a small royalty to the inventor, if his priority is certain, is far better than spending many times the amount on lawyers.

I. S. Moe of Moeville, Wis., is about to put in an electric-light plant at Zumbrota, Minn. He requests quotations from manufacturers and others for a 500-light plant.

An excellent suggestion is furnished the postal authorities in the action of the London postoffice in starting "a service of electric delivery vans between St. Martin's-le-Grand and Paddington Station." At present in the larger cities of this country the trolley service has been utilized to improve the local postal service. Why not go a step farther and establish a system of electric wagons for districts not covered by the street-railway lines? Such a system could be economically maintained and would prove a valuable auxiliary to the present mail-car service on the trolley lines.

The incorporation of a company to build an elevated electric railroad in the heart of the city was the first intimation to the people of Chicago that such a plan was contemplated. The project is backed by the Chicago City Railway company, and will be utilized by that corporation, if built, to carry its electric cars through the congested retail district. It is the purpose to construct an elevated road from South Water street in Dearborn to Polk street, thence in Plymouth place to Fourteenth street, and thence in Dearborn street to Thirty-ninth street, provided the right of way can be obtained.

After a year's work the committee appointed by the Chicago Electrical association to make a group of diagrams of the more common parts used in electrical construction, for the purpose of originating a standard code to be adopted by the Patent Office, has concluded its labors and made its report, which, together with the drawings, will be forwarded to Washington. The society will take steps to have the code adopted by the government. More than eighty diagrams were selected, covering all the more simple devices in electrical construction, and a standard drawing made of each. The idea is certainly an excellent one and contains many meritorious features.

The spread of populistic sentiment is noticeable in many bills that are introduced in Congress and in the state legislatures. A bill is now before the United States Senate proposing to tax the capital stock of every railroad holding a franchise or hereafter acquiring one under the District government, and upon every association or corporation doing business in the District of Columbia, at the rate of one-fourth mill for each one per cent. of dividend declared, if such dividend shall amount to six per cent. of the capital stock. In the event that it is less than six per cent., or that no dividend is declared, then the tax would be 1½ mills upon each dollar of the market value of stock. It is not feared that the Senate will pass such a measure.

With the remarkable increase in the demand for storage batteries abroad, attention is directed to the high price of accumulator boxes, or "recipients," as they are termed on the Continent, to distinguish them from what is technically termed the "cell," and also from the outer boxes. Manufacturers have found it necessary to offer an inducement for the invention of a new material to be used in this class of work. In a recent discussion at the Institution of Electrical Engineers in London, reference was made to the "breakages of ebonite cells, which, on the average, may be taken to cost 10 shillings apiece." Celluloid had been proposed and used to some extent, it was said, as it was not liable to fracture, but its great combustibility constituted so great a danger that its employment on a large scale was out of the question. American manufacturers will doubtless follow the discussion of this subject with interest and avail themselves of the experience of foreign engineers. The expansion of the storage-battery business in this country during the last few years has been truly remarkable, but well-informed experts believe the development thus far is nothing to what may confidently be expected in the immediate future. Anything tending to cut down cost and improve the durability of the battery will, therefore, be a valuable acquisition.

The late commissioner of patents, Major Butterworth, labored earnestly during his entire public career to improve the condition under which that important branch of the government service was conducted, but his appeals were not always successful, and, as a result, it is announced that a deplorable condition of affairs exists, which is due to the smallness of the working force. The situation is becoming more serious every day. The examiners are from three to four months behind in their work, and some divisions of the office are as much as six months behind. There are on hand awaiting action 13,000 cases, of which 9,600 have never been looked at, and it is probable that in the next four months the business will largely increase. March, April, May and June have heretofore been the heaviest months of the year, and there is no reason to doubt that the record will be kept up. The officials estimate that in that time 14,000 new cases will be received. The outlook, it will be seen, is anything but favorable. When it is remembered that last year the Patent Office turned into the treasury, after paying its running expenses, $317,135.05, and that the books of the treasurer of the United States show a total of $5,093,614.23 paid to the general government by the Patent Office after paying all its expenses, it is not to be wondered that inventors are protesting against delay. They are certainly entitled to prompt and efficient service, but they do not receive it. As a matter of fact, the government requires them to pay for the work in advance, and then they wait for months before having their applications considered. So far as the present force goes it is efficient and trustworthy, but it is not large enough to handle the business, which is growing every year. The condition of the Patent Office demands immediate attention, in the interest not only of the inventors, but of the manufacturers of the country as well.

At last the electric railway may be said to be making some advancement in Great Britain, although it must be admitted that the showing thus far is not at all complimentary to the enterprise of the nation. Comparison is invited between the table of electric railways and tramways published by the London Electrician on January 21st, and the corresponding table published a year ago. This year's statistics show that there are now 23 lines in operation, that the construction of 25 others is sufficiently far advanced to make it probable that they will commence running before the year is ended, and that there are now projected schemes for the construction of 10 underground electric railways in London and 48 light railways and tramways in that city and the provinces. The lines in actual operation, together with such as will commence running in a very few weeks, comprise over 150 miles of track, while the aggregate track of the lines working and in course of construction approximates 400 miles. After much discussion and hesitation English engineers have come to the conclusion that they cannot do better than follow in the footsteps of their American brethren. By far the greater number of the companies mentioned in the list this year, whether as being in operation, in process of construction or merely projected relate to the overhead trolley system. Neither the storage-battery car nor the conduit system has advanced, and no surface-contact system is reported in the United Kingdom, while the third-rail conductor system has been reserved exclusively for underground and elevated railways. It is contended that electric traction construction shows no sign of crystallization, for newer methods and improved details of plant are continually being introduced. Here, too, the English engineer follows American methods closely, and as the London Electrician says: "Perhaps the most interesting illustration of this is the decision of the New General Traction company to depart from the custom hitherto universal in this country of mechanically jointing and bonding tramway rails, and to adopt, in the new lines about to be equipped at Coventry and at Norwich, the Falk system of cast-welding rail-joints, which has proved so successful at Chicago and in other parts of the United States. British tramway engineers, whether directly interested in electric traction or only indirectly, will watch closely the process of acclimatization of cast-welding in this country. Probably, on the whole, our fickle climate will prove less trying to the cast-welded joint than the great extremes of temperature it has had to withstand in the climate of some parts of America." It would seem as if the engineers of England had about decided that their conservatism has been satisfied and the time was ripe to appropriate every valuable feature that had been developed in American street railway practice.

Telephone News from the Northwest.

[From the Minneapolis correspondent of the Western Electrician.]

The Minnesota Central Telephone company is an applicant for a franchise into St. Paul for long-distance telephone service. The company is one of four companies comprising the Western Electric Telephone system, which has 3,000 miles of toll lines in operation in Southern Minnesota, Northern Iowa and South Dakota. This company has just been granted admittance to Minneapolis by unanimous vote of the council.

The Wisconsin Valley Telephone company has completed a line between Eau Claire and Ashland, Wis., and put it in operation.

The local telephone company at Watertown, S. D., will improve its service by putting new receivers and transmitters on its instruments.

The Viroqua Telephone company of Viroqua, Wis., recently provided a concert over its wires for every town and village on its circuit, which covers Southwestern Wisconsin.

A telephone company has been formed at Crawfordsville, Ia., to build a line to Washington, Ia.

Steps have been taken at Mankato, Minn., to form the Mankato Citizens' Telephone Exchange. Articles of incorporation will be prepared at once.

The Fountain City Telephone company will extend its lines from Fountain City, Wis., to Cream, Lincoln and other points in the northern part of Buffalo County.

The Rocky Mountain Bell Telephone company will build a line from Great Falls, Mont., to Fort Benton.

The Wisconsin Telephone company is preparing to increase its toll lines between Milwaukee, Green Bay and Oshkosh, Wis., and also from Oshkosh to Menominee, Mich.

The telephone exchange has been completed at Sparta, Wis., and is operated by the Monroe County Telephone company.

The state auditor of Minnesota proposes to tax the property of the American Telephone and Telegraph company in Minnesota. The company returned the blanks forwarded for a return of its property with the reply that it had no taxable property. The auditor then notified the auditor of Hennepin County that the company's property had escaped taxation. The company's headquarters in the state are in Minneapolis, where it will be taxed, if at all. It is too late to place the tax on the rolls this year, but it can be entered next year for back years.

A stock company has been formed at Litchfield, Minn., to establish a telephone exchange there.

A special act legalizing the incorporation of the Mutual Telephone company of Des Moines, Ia., will be introduced in the Legislature. The company filed articles in regular form, but failed to publish them within 90 days from the time of filing, as required by law. This company now has 1,015 instruments in service, the largest exchange in the state, it is said, and has orders for 70 more. Its switchboard is filled and another board of 100 drops has been ordered.

The little town of Fairmont, Minn., has 121 telephones in use. The promoters of the local exchange have arranged for an equipment at Lakefield.

There is a fight on at Great Falls, Mont., between the Bell company and the local independent company. The Bell company has stolen a march on its rival by securing the Northern Montana company's system, which has been working with the independent company. The latter claims a contract with the Northern Montana, including a lease of the line for a year, but the records fail to show it.

The Rocky Mountain Bell Telephone company will erect a handsome building in Great Falls, Mont., to cost about $10,000.

The Midland Telephone company has been granted a franchise by the county commissioners in Dickey County, N. D. The company's headquarters are at Ellendale, N. D.

Telephones in Washington.

The House of Representatives has adopted an amendment to the District of Columbia appropriation bill fixing the price of telephones in the District of Columbia at $50 per year when on a single wire, and with proportionate decrease on wires on which more instruments are in use. The House has several times adopted such an amendment, but the Senate has invariably defeated it. The price for a single-wire telephone is now $100, and the residents of Washington think they are imposed upon. Recently the telephone company placed pay slot machines in hotels in order to prevent the guests from getting free telephone service. This step has aroused great hostility, and a concerted attempt will be made for more liberal service. The proprietor of a small hotel has brought suit against the company and demands the right to use the telephone in his hotel without being compelled to pay for each service. His place of business downtown has a telephone paid for by the year, and yet he is debarred the privilege of receiving a message from his hotel unless the sender pays the regular fee. The decision of the court in this case will no doubt affect the action of Congress upon the amendment reducing the price of telephone service.

A bill has been introduced in the House of Representatives to authorize the Automatic Telephone Exchange company, limited, to construct, operate and maintain a telephone exchange in the District of Columbia. The company has been formed under the laws of West Virginia. The bill carries with it power to lay conduits through the city and district, and establishes the rates to be charged for service as follows: Dwellings within a radius of one mile from the central exchange, $3 per month, inside two miles $4, and $1 per month additional for each additional mile; business purposes, $4 inside of one mile, $5 inside of two miles and $1 additional for each additional mile thereafter. The work of installation must be begun within six months after the passage of the bill, and 3,000 telephones must be connected within one year, under bond of $50,000.

Hudson Telephone Company.

Application has been made for the appointment of a receiver for the Hudson Telephone company, which was organized in Jersey City about a year ago. Manager G. H. Atkinson filed his resignation with the board of directors several days ago, and the president, Charles B. Thurston, resigned on February 4th. A large number of the stockholders have been at variance with the managing officers. The principal mover in the present crisis is Thomas Hill, who owns the building on Henderson street, Jersey City, where the company has its main offices. He is backed by 25 stockholders, who hold in the aggregate over 800 shares of stock.

It is charged in the application for the appointment of a receiver that the company was organized in the interest of the Best Telephone company, which is in process of liquidation. According to the bill of complaint, the Hudson Telephone company was to pay certain royalties for the use of the transmitter and receiver patents held by the Best Telephone company, which royalties, it is alleged, are excessive. The bill prays that the contract between the companies be brought into court for review. The bill further alleges that the Hudson Telephone company is interested in the New Jersey Telegraph and Telephone Construction company, and that the promoters of the former practically contracted with themselves in awarding the contract for constructing the lines, which, it is alleged, was never advertised according to law. It is alleged that several heavy judgments are pending against the company and that it is practically insolvent.

The concern started with a capital of $300,000, divided into 30,000 shares of $10 each. Mr. Atkinson is reported in an interview in the New York Sun as follows: "The concern is perfectly solvent, but some of the stockholders are entirely unreasonable in their expectations. The allegation that I am in any way connected with the New York and New Jersey Telegraph and Telephone Construction company is untrue. I am not now, nor have I ever been even remotely identified with that concern."

Telephone Legislation in Illinois.

Chicago telephone manufacturers propose to wage a vigorous warfare against a measure now before the Illinois Legislature which it is claimed will work great harm to the independent telephone movement, if passed.

"By affecting the interests of the independent telephone companies now operating in the state, to say nothing of those being organized, the measure will injure the people at large," said Vice-president W. A. Bisland of the Western Telephone Construction company. "The bill provides that after making a statement to the auditor, the person or corporation making the same shall pay a tax of $10 for each telephone connection, and the further sum of $50 for each telephone connection with a device known as a telephone slot arrangement. This seems to be the Bell method of fighting the cheaper rates that are in vogue among the independent companies now giving towns and farming districts in Illinois good service. The measure will not hurt the Bell company as much as the independent companies, for the reason that the older corporation feels itself well intrenched by the occupancy of the field in the larger cities.

"The big cities pay the exorbitant rates demanded by the Bell company and the small cities depend to a great extent upon the long-distance connections with the larger places. The Bell company is therefore in a position to pay to the parent company at Boston its unjust rentals squeezed from the people. We propose to defeat this bill if possible and have advised the members of the House of Representatives and the senators from Cook County to fight the issue."

Large Railway Generators.

The largest generator for electric traction work ever built is now under construction at the works of the General Electric company at Schenectady, N. Y. When finished it will be installed at the Logan street station of the Louisville Railway company at Louisville, Ky. On account of its large diameter the armature of this generator cannot be transported over the railroads in its completed state either erect or on its side. The generator will, therefore, be assembled in Louisville. The completed machine will have 22 poles, an output of 2,400 kilowatts, or 3,000 horse power, and will be driven at a speed of 75 revolutions per minute by a 4,000 horse power, cross-compound engine, to be furnished by the Allis company. The generator will be constructed to stand an overload of about one-third, so that the capacity in cases of emergencies may equal 3,200 kilowatts, or over 4,000 horse power. The principal dimensions of the machine will be as follows: Diameter of field frame, 19 feet; width of field frame, 4 feet 1 inch; diameter of armature, 12 feet 9 inches; diameter of commutator, 9 feet 8 inches; diameter of shaft, 2 feet 3 inches; total weight of armature and commutator, 83,000 pounds; width of armature, 5 feet; width of commutator, 21 inches; total width of generator, 77 inches; total weight of generator complete, 174,000 pounds. Previous to the manufacture of this machine the largest generators constructed for electric railway work were those of 2,500 horse power, the first of which was used in the Intramural power house at the World's Fair. Dynamos of the same enormous output have since been installed in Philadelphia, Boston and Chicago. Four are also operating in the Kent avenue power station of the Brooklyn city railroad, and two of similar size are now being added. At present this power house contains the largest single exhibit of moving machinery in Greater New York. In no other city of the state, with the exception of Niagara Falls, can 10,000 horse power in engines and dynamos be seen in almost constant daily operation.

Electric Railways in Massachusetts.

[From the Boston correspondent of the Western Electrician.]

The Massachusetts Board of Railroad Commissioners has transmitted to the state Legislature the first part of its report for 1897, dealing particularly with electric-railway travel to and from Boston and electricity in railroad operation. The report says:

"It appears that the railroads entering Boston on the north have suffered in the last four years a diminution of 13.2 per cent. in the annual number of passengers carried to and from the city, and those entering on the south of 11 per cent. The loss of the New England road (22.2 per cent.) is the largest, and that of the Fitchburg road (4.6 per cent.) the least. The losses of the other roads range about midway between these extremes, the average loss for the six roads being 12.2 per cent.

"In striking contrast to the showing of the railroads in this respect is that of the five electric street railways whose lines run from or into the city of Boston—as appears in the table:

STREET-RAILWAY PASSENGERS ON BOSTON AND SUBURBAN LINES.

Railway Companies.	No. of passengers in 1893.	No. of passengers in 1897.	Increase in number.	Percentage of increase.
Lynn & Boston	21,682,163	27,386,847	5,704,684	26.3
Norfolk Suburban*	....	1,955,119	1,955,119	....
Quincy & Boston	922,388	2,358,854	1,436,466	155.7
West End	133,863,618	172,554,513	38,690,895	28.9
West Rox. & Roslindale†	....	1,045,088	1,045,088	......
Totals	156,468,169	205,300,421	48,832,252	31.2

*Commenced operation in May, 1894. †Commenced operation in September, 1896.

"It is seen that from 1893 to 1897 the number of passengers on the West End railway, which carries over five-sixths of the whole number included in the table, has increased at the rate of 9,672,700 passengers per year, amounting to an increase of 28.9 per cent. for the four years; and on the five railways taken together, at the rate of 12,208,000 passengers per year, and 31.2 per cent. for the four years. A very considerable portion of the travel on these railways is not, of course, travel to and from Boston; but there is good reason to believe that the latter travel has grown at as rapid a rate, to say the least, as the other travel on these lines.

"In the absence of data for a more exact statement, it appears to be a safe estimate that in the last four years the annual amount of suburban travel to and from Boston on the railroad lines has diminished in the aggregate not less than 10 per cent.; and on the electric railway lines has increased more than 25 per cent. This shifting in the current of the traffic in question is not to be attributed in the main to anything that the railroad companies have done or have failed to do. It is the result of well understood changes in the conditions of such transportation, for which the railroad companies are not responsible, and which they are practically unable to control."

Under the caption "Electricity in Railroad Operation" the board says:

"It is now nearly six years since (by St. 1892, c 110) the railroad corporations of this state were 'authorized to operate their railroads by electricity.' It will be interesting to note the progress that has thus far been made by our railroad companies in the actual use of this motive power.

"In 1895, the Nantasket Beach railroad, a spur of 6.95 miles in length from the South Shore branch of the Old Colony system, used mainly for pleasure and excursion travel during the summer season, was reconstructed for electric operation by the overhead trolley system. A description of this line and of the methods of its equipment and successful operation was given in the report of two years ago, and need not be here repeated.

"In 1896, a section of the South Shore branch, 3.80 miles in length from the junction of the Nan

tasket Beach line, was equipped for electric operation by the third-rail system, the power being supplied from the existing power station. Both of these lines are operated under lease by the New York, New Haven and Hartford Railroad company; and in the annual statement of the directors of that company, dated September 12, 1896, the following is said in regard to the success of the latter experiment: 'The use of electricity as a motive power has been extended as foreshadowed in the last statement. On the South Shore branch of the Old Colony system the current has been successfully and economically conveyed in a third rail insulated upon wooden blocks in the center of each track. The results have surprised experts, and it is now probable that a third rail will be laid at various points upon the company's property during the year to come. Short branches to the centers of business and population may then be constructed from the company's lines.' The same company has also made preparation for the use of electric motive power on some of its lines in the state of Connecticut—as appears in the last annual statement of its directors, dated September 11, 1897: 'During the fiscal year a new electric power house has been constructed at Berlin, Conn. It is so situated that the current may be applied in four different directions on this road, and may also supply the New England railroad, via New Britain to Hartford and to Bristol. Its line between New Britain and Hartford has been running since May 24, 1897.' This further and fuller statement regarding the last-mentioned line is found in the recent annual report of the New England Railroad company, under date of September 17, 1897: 'During the year this company has laid a third rail on one of its tracks and prepared the track between Hartford and New Britain for operation by electricity. It has been so operated since May 24, 1897,

GIANT BRAZER.

and its efficiency has been such that the company may extend the third rail toward Bristol the coming year. Frequent and rapid communication certainly develops suburban travel, and electricity seems to be the best and most economical power for this purpose.'

"The section of the New England road referred to, between Hartford and New Britain, is 9.10 miles long. It appears, therefore, that the Massachusetts companies have equipped in all 19.85 miles of their lines for electric operation, 6.95 miles by the overhead trolley, and 12.90 miles by the third-rail system. The use of steam power on these lines is also continued, as traffic may require.

"In the twenty-seventh annual report of the board (January, 1896, pp. 10-26), the utility and limitations, in its present development, of electricity as a motive power in standard railroad operation, were considered at some length. Nothing appears to have occurred since that time to call for a renewal of the discussion, or to require any substantial revision of the views and conclusions then expressed.

"The practicability of the use, under favorable conditions, of a third rail for the transmission of the electric current on surface roads (contrary to the then generally accepted opinion of electrical experts) is perhaps the most important fact of more recent demonstration. The third rail has manifest advantages in point of practical convenience over the overhead trolley. It has also the disadvantage that it cannot be laid with safety upon the surface of highways and other traveled places where crossed by the railroad at grade, and is therefore completely adapted only to sections of railroad that are free from such crossings. Neither has it as yet been put to the test of all the possible vicissitudes of a New England winter. Improvements in its construction or adaptation to the use in question may doubtless be made.

"Our code of railroad laws has been framed with reference to operation by steam power only. These laws contain many specific provisions and requirements relative to the equipment of locomotives and cars and trains with devices and appliances for the security of travelers on the railroad or highway and for the protection of employes, or to the conveyance of baggage and other property usually carried on passenger trains, and to various other details of railroad equipment and operation. Some of these statutory regulations will be found either to have no proper application or to require some modification in order that they may have a reasonable application to the rolling stock and methods of operation best adapted to a safe and efficient electric service. There may be occasion to ask the Legislature to consider some such changes in the existing railroad laws at the present session; and such consideration is respectfully recommended."

Keystone Arc Light Voltmeter and Ground Detector.

The Keystone arc light voltmeter and ground detector, herewith illustrated, combines in one instrument a voltmeter which will indicate the actual voltage of each circuit, or the total voltage of the generator, and consequently the number of lamps burning, and a ground detector which will indicate a ground and determine its character and location. It will indicate the character of the ground, its resistance and its location on the lines by taking three readings and equating them in simple formulæ. It can be used when the circuit is alive, thus giving results under working conditions. It replaces a cable-testing set which has proved extremely unsatisfactory owing to the many microphone contacts in circuit. It is self-contained, well made, accurate, reliable, dead-beat, unaffected by external fields or changes in temperature, easy and safe to manipulate and low in price. In connection with a set of switches and a battery of cells, or an ordinary incandescent circuit, it can be used to test the continuity of the line and the resistance from line to earth during the day, and for this purpose will be found much easier to handle, more accurate in results and quicker in action than any galvanometer and bridge method.

An idea of the general appearance of the instrument may be obtained from the cut. It consists of a compound galvanometer system, mounted in a case which effectually shields the instrument from the influence of external fields. This case is finished in oxidized copper, well lacquered, and presents an attractive appearance. The scale is practically uniform from zero to maximum reading, indications are dead-beat, and the temperature coefficient of the wire employed is so small that external changes of temperature make no difference in indications.

In setting up the instrument all that is necessary is to secure it to the switchboard by means of the lugs provided, taking care that the pointer stands at zero when no current is passing through the instrument.

Explicit instructions accompany each instrument, giving directions which will enable any switchboard attendant to set the instrument up and operate it successfully. The Keystone Electrical Instrument company of Philadelphia manufactures this device.

Giant Brazer.

An illustration is presented herewith of an entirely new brazer, just put on the market by the White Manufacturing company of 158 Indiana street, Chicago, and invented and patented by John C. Dupee, superintendent of the company's factory. This brazer has three new features, namely, the burner, a swing joint on the feed-pipe to the burner, and the rack for handling the work. The principle of the burner is practically the same as that employed in the kerosene-oil burner of the mammoth brazer, brought out by this company sometime since, but is provided with a larger generator. The giant burner thus constructed is equal in capacity to the ordinary two-burner brazer, although using less oil. The orifice through which the oil passes is but .34 inch in diameter, which could not consume more than half a gallon of oil per hour at a pressure of 50 to 60 pounds. This brazer is operated under a range of 40 to 70 pounds air pressure. A great advantage is gained by having a single burner of this power, as a stronger flame is thus concentrated upon a piece of work, enabling better results to be accomplished than are ordinarily expected from a brazer. The swing joint enables the burner to be used at any desired angle, permitting the flame to be even directed vertically or straight downward if needed. This is particularly desirable in bicycle work. The illustration shows the brazer in use on a large frame for a tandem or a triplet. The swing joint is also useful in cases in which it is easier to take the brazer to the work than the work to the brazer. The flame can then be directed exactly where it is wanted. The back is adjustable in height and is fitted on a movable stand which can either be used in portable form or screwed to the floor. The spelter cup is also adjustable and may be moved up or down or around on any side of the rack to suit the convenience of the operator. The back is lined with firebrick, is set at an oblique angle so that the bicycle frame or other work inclines away from the burner. The tank of this brazer holds 10 gallons. While intended specially for burning kerosene it can be used for either kerosene or gasoline. It is adapted to quite a general line of forging as well as rivet heating, bridge and railroad work and special places which will readily suggest themselves to the practical mechanic.

Lamp Inspector's Indicating Wattmeter.

The successful operation of an incandescent-lighting system depends largely upon the use of lamps of proper efficiency. To secure the most satisfactory service and highest economy, the efficiency of the lamps should be as high as the fluctuation of voltage on the circuits will permit. The selection of lamps for a particular installation should, therefore, be made with regard to the regulation obtained with the transformers in use. Efficiency is also the true basis for renewal of lamps, for it is manifestly uneconomical to continue a lamp in service when it has so deteriorated that the current it unnecessarily consumes costs more than a new lamp. A portable instrument to determine accurately and rapidly the watts per candle power required by a lamp is of great value in selecting new lamps and in testing lamps in service. The General Electric company has recently designed and introduced the Thomson inclined-coil portable indicating wattmeter for service of this class. The present design was adopted after numerous experiments to determine the most advantageous arrangement to facilitate rapid testing of lamps without inconvenience to their users. On account of the rapidity with which readings may be made, the indicating wattmeter will also be found invaluable for testing lamps in barrel lots either with or without a photometer. The wattmeter will accurately indicate the energy used by small fan motors and is, therefore, particularly useful in comparing, for a customer's benefit, the relative amount of energy required by a fan motor and an ordinary incandescent lamp. By supplying the secondary of a transformer with current, its core loss may be easily determined by the indicating wattmeter.

For rapid connection the wattmeter is supplied

KEYSTONE ARC LIGHT VOLTMETER AND GROUND DETECTOR.

with two special plugs, an Edison with T-H adapter, and a Westinghouse, thus providing ready means for connection to the three forms of sockets most generally in use. The lamp to be tested is inserted in one of the receptacles in the base of the instrument, and the proper plug placed in any convenient socket. Lead wires are provided suitably tipped at one end for insertion in the plugs and at the other for connection to the binding-posts of the instrument. A small secondary plug arranged to fit the regular plugs and provided with two small binding-posts is also supplied with every instrument. With this convenient device the power required by small motors or other apparatus may be conveniently measured.

The capacity of the indicating wattmeter is 150 watts. Lamps of any candle power up to 32 and of any voltage up to 150 may be tested, as may also any device, the consumption of energy in which is not over 150 watts at any voltage not exceeding 150.

The fact that the instrument is equally well adapted for use on either direct or alternating currents necessitates the use of only one instrument in stations using both systems.

On direct-current circuits reverse readings should be taken to eliminate the possibility of any slight error which may be introduced in all instruments of this class by the presence of local fields. A special reversing button is provided to reverse the current in the instrument and lamp without permitting the needle to fall back to zero. The usual convenience of reversing lead terminals is eliminated by the reversing button. When reversed readings are taken, the mean of the two is, of course, taken as the final reading.

Another advantageous feature of the instrument is the damping device. A button is provided which releases the needle or pointer from the damping brake only when depressed. When the button is released the needle is held at the point of the last indication; therefore, if the current is turned off and then on again, or reversed, the necessity of waiting for the pointer to swing from zero to a state of rest is avoided and very rapid readings may be taken.

The terminals, reversing and damping buttons

are mounted on a vulcanite baseboard, above which the graduated dial slightly projects.

The instrument is mounted in a finely polished carrying case, with snap lock. It is light and compact, the external dimensions being 7⅜ inches by 7 inches by 4½ inches. All parts are finished in polished nickel plate.

Injunction Granted on Van Depoele Patent.

Judge Lacombe handed down the following decision and opinion on February 7th in the United States Circuit Court for the Southern District of New York in the case of the Thomson-Houston Electric company against the Union Railway company, upon motion for preliminary injunction under claims two and four of the Van Depoele patent No. 495,443:

"The circumstance that these two claims were not expressly declared upon in the Winchester avenue case decided by Judge Townsend (71 F. R. 192) is not controlling. In Westinghouse Air Brake company against New York Air Brake company (65 F. R.) a preliminary injunction was granted by this court on patent No. 360,070, although it had not been previously adjudicated, on the ground that in the earlier litigation it had been 'discussed at great length and its meritoriousness clearly recognized.' And that injunction was sustained in the Court of Appeals (69 F. R. 715).

"It is perfectly plain, from an examination of the opinion of Judge Townsend and the voluminous record upon which it is based, that the very combination covered by claims two and four, viz., the overhead conductor and the trailing arm hinged and pivoted to the car, so as to bridge the space between it and the conductor, with a contact device at its upper end capable of being pressed upwardly into engagement with the conductor, was fully considered by him and held to be a most meritorious invention, and Van Depoele its inventor. It is thought that the decision of the Court of Appeals in this circuit in the Hoosick Railway case (82 F. R. 46) has not affected the weight of the Winchester avenue decision so far as it deals with the questions of invention and priority. The Court of Appeals held that claims 6, 7, 8, 12 and 16 of the patent here sued on were invalid because the particular combination or combinations which those claims covered had been already patented by Van Depoele in his earlier patent No. 424,695. And this was all that it held. The complainant therefore comes into this court with the presumption arising from those judicial conclusions in the Winchester avenue case, which the Court of Appeals did not disturb.

"The two claims now declared on are as follows:

"2. The combination of a car, an overhead conductor above the car, a contact device making underneath contact with the conductor, and an arm carried by the car and carrying the contact device, and pivoted so as to swing freely around a vertical axis.

"4. The combination of a car, an overhead conductor above the car, a contract device making underneath contact with the conductor, and an arm on the car movable on both a vertical and a transverse axis and carrying the contact device.

"In the Hoosick railway case double patenting was found because each of the claims therein considered contained in some form of words a reference to a 'spring' or 'weight' or 'weighted spring' or 'torsion spring' or 'spring device,' one of whose two functions was to centralize the depressed end of the trolley, and the other was to give the upward pressure to the contact end.

"The two claims quoted contain no words which can be tortured into any such reference. Manifestly they were intended to cover and do cover only the combination of the car and conductor, with an underrunning trolley capable of swinging freely on a vertical axis, and thus adapted to curves and irregularities in the conductor. And Judge Townsend held that Van Depoele was the first to make practicable the electrical propulsion of an electric railway by 'a long, rigid arm upwardly pressed and capable of universal movement.' The defendant contends that the weighted spring, which is the only means for imparting upward pressure disclosed in the patent, must be read into these claims, for the reason that without it the claims would cover 'inoperative and useless' combinations. It seems unnecessary to discuss the authorities cited by complainant in opposition to this contention (Deering vs. Winona Harvester company, 155 U. S 286, Taylor vs. Sawyer, 75 F. R. 301; Halloway vs. Dow, 54 F R 511) Although an additional device may have to be added to make the combination operative automatically, it is none the less operative without such addition. A boy seated on the roof of the car would impart the upward pressure, not as economically nor as well as the weighted spring would, but quite sufficiently to insure the operation of the combination expressed in the claim.

"It must be concluded, then, that claims two and four do not cover a spring or weight or torsion device, and it is conceded that they contain no switching device. In the earlier patent no claim is to be found which does not contain either the spring or weight or the switching device. It would seem, then, that these claims certainly are not obnoxious to the criticism of the Court of Appeals and that no 'double patenting' is shown. And since the meritoriousness of the invention and Van Depoele's priority was found by Judge Townsend in the Winchester avenue case, complainant should be entitled to hold what it has established after long and expensive litigation, unless the case presented here is changed by evidence not before the court in that case. I cannot see that the Hunter and Deligny patents, which are only new ones, are any more of an anticipation than were those introduced in the Winchester avenue case.

"It is further contended that complainant has unreasonably neglected and delayed to enter a disclaimer of claims 6, 7, 8, 12 and 16 of the patent in suit, which were held void by the Court of Appeals. That decision, however, was rendered upon an appeal from an order, and complainant is naturally averse to finally relinquishing these claims until it may have had an opportunity to apply to the Supreme Court for a certiorari, an application which it is useless for it to make when only a preliminary order is involved. There seems to be good ground for delaying disclaimer.

"The argument that by its disclaimer of claim nine complainant has disclaimed the entire invention of the patent, which is, therefore, wholly void, is unfortified by authority and unpersuasive.

"Infringement cannot be seriously disputed. Defendant's device is practically a duplication of that used by Van Depoele in New Orleans in 1885. Complainant may take order for injunction pendente lite, but when issued its operation may be stayed for 30 days to give defendant an opportunity to review this decision at this term of the Court of Appeals."

Completing the Postal Company's Marine Cable System.

On Saturday, January 29th, a cable was laid from Sandy Hook to the mainland, thereby completing the system for marine service which the Postal Telegraph-cable company has been establishing. On the day previous a party of gentlemen, including Captain W. L. Candee and George T. Manson of the Okonite company, E. G. Cochrane, general superintendent of construction for the eastern division of the Postal company, and George W. Blanchard, assistant superintendent for the same company, visited a summer hotel just below the Twin Lights of the Highlands of Navesink and spent the night there, as it was planned to have Captain Scott of the Wrecker rom New London, with his trained crew, in charge of a sea-going tug and wrecking scow carrying the cable, to reach the spot for laying early in the morning, where he would be joined by the party. The night was stormy and the morning broke with skies leaden and lowering, and a piercing wind blowing. The party was carried by a locomotive to the point of Sandy Hook, and on the arrival of Captain Scott's flotilla was embarked in lifeboats.

The end of the cable was carried ashore at a point about half-way down, or shortly beyond the spot where the ocean has broken across Sandy Hook, thus changing it into an island. Connections were then made at the terminal pole and the trench running up the short beach containing the cable was filled in. Because of the shallowness of the water it was not possible to use the tug, and the huge scow carrying the cable was compelled, by means of its own engine and while attached to anchors carried to the opposite shore, to "lift itself by its boot-straps."

The method of laying the cable was unique. Instead of running it off reels, it was coiled in a circle on the deck, the end being paid out by passing through a block raised high in the air, then descending to the stern, passing through a brake made of wood so as not to injure the strands. As the scow moved slowly forward by means of its own engine connected to the anchor on the shore, the cable dropped evenly to the bottom.

When the strip of land which juts into the Horseshoe with water on either side was reached, a bight of the cable was taken ashore, and, by using a strong rope connected to the engine, was hauled across the land to be taken up again on the other side by the scow and carried through he remaining water.

The length of the cable laid was about one mile in a straight line and was one of the standard marine forms made by the Okonite company of New York, of which so many have been laid of late years. The total weight was about 10 tons, or four pounds to the foot. This link gives the Postal company direct cable connection from Coney Island across to Sandy Hook and from Sandy Hook to the Highlands, also the alternative connection from Fire Island across Brooklyn to New York and from Coney Island through New York Bay to New York city.

By a vote of the stockholders the Hastonville, Mantua and Fairmount passenger railroad was leased for 999 years to the Union Traction company, Philadelphia, January 27th, at a rental of six per cent. on $500,000 preferred stock and four per cent. on $2,000,000 common stock. The effort to prevent the lease by a legal injunction failed. The Hastonville property, with its leased connections, was the only line of surface railway operated as a competitor of the street-car consolidation in Philadelphia. The entire street-railway system is now under one management.

Electric Lighting for Profit.[1]

By Alex Dow.

I submit as the first proposition that we are all in business to make a profit. I don't expect to be contradicted on that proposition, although some may wish to so amend it as to indicate that they are at present content if they can avoid a loss. As a second proposition I submit that the conditions of the electric light industry have so changed in the last few years that the opportunities of profit are limited, that the margin between earnings and expenses tends to vanish and can only be kept in view by unceasing endeavors to increase the one and reduce the other. The days have departed when a neat dividend could be paid on a small business done at high prices, and now if a dividend is to be paid at all it must be earned by doing all the business that can be obtained and at prices set but little above the actual cost of production. As the preceding statement forms the text of this discourse, I ask your attention to its repetition, as follows: I believe that the proper policy of electric light management under the conditions of the present time, is to sell electric energy to every accessible user, in any shape that the user requires and at the lowest price which will pay a reasonable profit on the capital invested.

A New Policy for New Times.

Those of you who were in the business at its beginning will recognize in this profession of faith the converse of the rule which then governed us. We used to believe in a "system," and the people who taught us so to believe charged us so much for the experience, and the incidental machinery which we acquired, that we in turn had to collect great prices for the product sold to our customers. The rule was to get out of the business all that it would stand, and if a possible customer did not like the particular kind of energy which our "system" furnished and thought he would like the kind which some other alleged system was supposed to produce, we considered him a heretic. Electric light was then a novelty and a luxury and a mystery, and was to be respected and paid for accordingly. Nowadays, it is a thing of domestic use, the machinery for its production is sold as freely as any other machinery, the principles governing its distribution are taught to all who desire to learn and its supply is recognized as a customary or even necessary public service, exactly as is the supply of gas and water. It is proper that we should announce a policy suited to the new condition. That many have done so I know, and also that some have long been governed by just such a policy as I advocate, but there still remain, to the detriment of the business at large, some who are trying to run their affairs on the old plan. They do not profess to do so, and if challenged they may plead the old excuse —that the cost of their plant and the losses incident to its first operation have been so great as to require high prices for the energy sold. That excuse is not valid in these latter days. Taxing customers all they will stand means competition either by an opposition plant or by the municipality, and either of these means ruin to the station which is run on the old lines.

Of course I do not intimate that any member of this association is managing his business to-day after the fashion of the '80's. But each of us knows of some plant in the next town to ours which is run just that way. That plant is going to fight it out on the old line until it is wiped out by a municipal plant, and the municipal plant will publish a report to the whole United States that it has reduced the price of lighting 30 or 40 per cent. Then you and I and each of us are going to have the trouble of explaining at great length to our own particular municipal authorities why a municipal plant established in our town cannot possibly make any similar reduction.

Gentlemen, the man who used to sell experience to us is probably to-day trying to show the ambitious city fathers of that other town next to ours how well they can serve their constituents and how much honor they can obtain from society at large by engaging their municipality in the electric lighting business. Our friend with experience to sell is not one bit more exact in his statements than he used to be long ago, and we cannot honestly say that his operations are beneficial to our business; but he is less detrimental than the man who gives him a chance to get in his work, the man who ought to be giving good service to a satisfied constituency, but who is furnishing lights that are a disgrace to the "system" and its owner and trying to collect higher rates than those at which you and I are giving first-class service to our public.

What Is a Reasonable Profit?

This is a much-discussed question. The man in the next town believes that a reasonable profit is everything he can get, and at the other extremity of belief is the man who holds that no public service should pay a profit to any individual. Between these limits will be found the opinions of the great majority of Americans whose democratic training has taught them that the commonwealth should not undertake any work which can be satisfactorily performed by private enterprise. Those members of this great majority, who have money invested in

1. Read before the Northwestern Electrical association, Milwaukee, Wis., January 19, 1898.

manufacturing or in commerce, recognize that a reasonable profit means something more than can be obtained by the investment of their funds in government bonds or by placing them in a savings bank, and yet something less than is hoped for when the investment is of a speculative character, involving risk of total loss of capital, such as the exploiting of a new mine or the insurance of an overdue vessel and its cargo.

I believe that after operating expenses are paid and any deterioration of the investment shown by a careful inventory has been made good, a dividend such as is paid by a good manufacturing business is reasonable for electric lighting. Such a dividend will necessarily vary with the line of manufacture; those concerns who manufacture a staple having a practically constant market being satisfied with a narrower margin of profit than those others where the production has to be varied from time to time and new markets developed at intervals. The same considerations govern in the electric lighting business. A station which is well established, has no ruinous competition to meet, is not threatened by municipal interference, and is not obliged to continually risk money in extensions of an uncertain character, may well pay a dividend but little in excess of the current rate of interest in savings banks. The station in which all these conditions are reversed, particularly when there is a prospect of the investment being wiped out by causes which its management cannot control, is entitled to a greater return.

There is much work to be done in the education of the public to a proper understanding of the economical principles underlying this subject. The citizen who has theories about municipal service does not apply these to his own affairs, nor will he apply to his theories the rules which govern his personal practice until you show him that this should be done. He thinks it no harm that he should draw from the capital invested in his own business 10 or 15 or 20 per cent. in addition to a fair salary for management and any loss that is shown by annual inventory. He thinks it entirely proper that he should build up a business worth much more than its nominal capital, by returning into it a large annual surplus, but he will denounce as extortionate an electric lighting company which pays a good deal less than 10 per cent., and for such a company to show a surplus is, in his eyes, prima facie evidence of robbery of the public. He, on the one hand, refuses to protect the public-service corporation from unlimited competition, and, on the other hand, demands that it do business for a rate of profit accepted only on the safest class of investment bonds.

In Europe they are more logical. They limit the price which a company may charge to its customers and the dividend which it may pay to its stockholders. They require the company to give good service to all who demand it within a certain area. But at the same time they permit no competitor to enter the same district and they provide for the purchase of the property at a reasonable price in the event of the franchise not being renewed at the expiration of its term. Where they restrict they also protect. Our theorists have yet to learn that these two actions should go together, and it seems to be our affair to teach them this lesson.

How Shall Rates Be Made?

There has been of late much discussion of this subject at conventions and in the electrical press, and with good reason. American practice has heretofore been to make rates without sufficient analysis of cost, and particularly without attempting to make each unit of energy sold bear its proper share of the standing charges of the plant. Premising that we are to readjust rates for a minimum profit, we must do so according to a carefully considered system. It will not do to make a horizontal cut on the present schedules, because analysis will show that some business now done at the highest rate is not profitable, and a reduction of rate should only be made on business that is profitable.

It has been said that American customers insist on a uniform rate—a "one price American plan" method of charging. I do not find it so. I have no difficulty in explaining to the customers whom I meet why some business should pay a higher rate than other business, and other electric light men tell me that as soon as they have got the principles involved clearly defined in their own minds their experience with customers is similar to mine.

The basis of any system of ratemaking must be analysis of the cost of production. The method of analysis which I have found most useful is that proposed by Mr. Arthur Wright. The paper read by that gentleman at the last meeting of the National Electric Light association [illegible] familiar to you, but as American conditions usually differ from those existing at Brighton, it [illegible] possible to apply the best method of [illegible] standing and running [illegible] which Mr. Wright found convenient, and [illegible] in detail must be made. I use the following method: Consider what the condition of the station would be if you were obliged to be ready to do the [illegible] business that you now do, and during the [illegible] taking current [illegible] on duty, dynamos [illegible] lines [illegible] connections made to customers' premises [illegible] would burn enough coal to keep [illegible] the dynamos in motion, and you would [illegible] help for these conditions. [illegible] so much coal as if the machinery were running at full load, and you might need less help. Your lines would be out in the weather or buried in the ground, and that deterioration which is due to time and to climate would go on just the same and would have to be made good by a repair gang. But you would not need renewals of incandescent lamps or carbons and you would not keep any men to put in fuses for customers or to read meters. You would need a manager and an engineer and an electrician just as you do now, but you would not need a bill clerk nor a collector, and you might do without an office boy. My rule is to ask whether the item of expense under consideration would continue or would cease under the conditions described. If it would continue it is a standing charge. If it would cease it is a running charge. It is clear that taxes, insurance and interest are standing charges.

Mr. Wright has shown us that it costs us a great deal of money to get ready to serve a customer, even though the customer only requires service for a single hour in a year. This amount he calls the standing charge. He has pointed out that a uniform rate takes no account of this, but is apparently based on the assumption that it costs just the same to furnish current to a customer for one hour in the year as for each hour of one thousand hours in a year. He argues correctly that in making rates we should take account of a customer's load factor, and he goes on to describe an ingenious method and an ingenious device invented by himself for taking such account. Whether we adopt his device or not, we must all admit the correctness of his statement of the conditions governing costs of production and we must, if we are hereafter to do business at a profit, make our rates with a due regard to these conditions.

To discuss in detail the whole theory and practice of ratemaking is beyond the scope of this paper. I advise each of you who has not already done so to make analysis of your costs in such manner as to distinguish between standing and running expenses. Using Mr. Wright's paper as a text-book, you will find, as I did, that the labor is well paid for by the results obtained. Properly tabulated, these results will show what business is profitable at any given rate or what rate should be made on any given business. My analysis showed me that I could afford to sell current to a large class of users at $4\frac{1}{2}$ cents per unit, while a rate already established at 14.4 cents for another large class was not profitable. Now I am taking all the $4\frac{1}{2}$-cent business I can find and am letting other people hunt for the 14.4-cent kind.

Classes of Business.

The immediate business of an electric lighting station is to supply incandescent and arc lighting and power for stationary motors. Some small plants limit their business to lighting, and thereby avoid operating during the daylight hours. I think that this is often done without good reason. There is nearly every village some demand for power, or such a demand can be developed by an enterprising manager. It is likely that the rates to be obtained for power will be very low, but if they will pay the additional cost of running the station during the daytime and also carry some proportion of the standing charges, these low rates may be profitable indirectly by reducing the amount of standing charges remaining to be earned by the lighting business. It is certain that interest, insurance and taxes run for 24 hours a day, although the plant may only operate for 12, and if the power load will pay half of these items, in addition to its actual runing cost, it is worth having.

Some stations do not run all night. The people in the village where such a station is located may go to bed early and may not use any appreciable amount of current after 11 o'clock or midnight. But I have always found it difficult to work up a good business in residence lighting unless the plant undertook to give all-night service. Apparently customers do not care to have a duplicate lighting equipment in their residences. They do not fully appreciate the beauty of incandescent lighting if it cannot be switched on at any moment when it is wanted. People sometimes want lights between midnight and morning in their houses, and I suppose will continue to do so as long as our children come into this world with unreasonable ideas as to the part of the day in which they should do their sleeping.

I am sometimes told that residence lighting is unprofitable. It surely is, if every residence that is served requires an independent transformer, and if only one residence in a dozen takes current at all. The only way to do residence lighting at a profit is to do all the lighting or nearly all that there is in a given residence district, and for this purpose the rate must be placed so that every possible customer can afford it. I have tried the experiment of low residence rates on a small scale more than once, and in each instance with success. It is to be tried now on a large scale in several stations, and I am certain that the experiment will be successful. The load factor of residence lighting is much better than the average load factor of many stations.

General Distribution System.

It is a serious handicap to a station when it is obliged to run two or three separate types of dynamos and to maintain two or three separate distributing systems for the supply of different kinds of energy. The best practice to-day is to furnish incandescent lights, arc lights and motor service from the same dynamos and same mains. This is a subject to be considered in the original plan of the station, but there are instances where old stations have been rearranged with decided financial advantage. When a power load can be had, even at the low rates already spoken of, a study of the local conditions should be made with a view to seeing whether a general distribution system will not be a source of profit. To design a new station without such a system is almost criminal.

Supply of Street-railway Current.

There has not yet been devised a satisfactory system whereby a supply of 500-volt current for railway work can be combined with a general lighting distribution. Therefore a proposal that a lighting station should furnish such current must be dealt with as involving a new investment. This investment is always the cost of dynamo and switchboard and usually the cost of an engine. The street railway evening load in winter-time coincides with the heaviest load on the lighting system for about 200 hours per annum. At all other hours the street-railway demand is a desirable addition to the load on the boilers, and in most stations the dynamo and switchboard can be cared for without cost for additional help. If the boilers are properly designed to suit the conditions, they may be driven beyond their usual rate during these 200 hours with greater profit than would be possible if additional boiler capacity had to be installed. Furnishing street-railway current appears, therefore, to be equivalent to the sale of steam to a special engine and the furnishing of attendants to an additional engine and dynamo; and it should be considered as a business proposition on that basis, and not in the same manner as a demand for current from the electric lighting plant.

Street Lighting Contracts.

If street lights can be served from a general distribution system, the rate should be made in the same manner as the rate for any other service from that system. As street lights usually run about 4,000 hours a year, a rate made on a scientific basis will be very low in comparison with the rate for ordinary commercial lighting. This is not in accordance with the old practice of making all the profit of the old business of a street lighting contract, but it is distinctly in accordance with the more modern practice which will probably become general.

Municipal contracts which can be performed without investment in special machinery are desirable business in that the payment is prompt and absolutely secure, and that the conditions of their performance are clearly laid down in the original agreement. For that reason the tendency appears to be to take such contracts at a very narrow margin of profit. But when the performance of a street lighting contract requires an investment in special machinery and the building of special lines, such a contract is usually undesirable business. It is impossible, under present conditions, to secure such prices for street lighting as will return the investment to the stockholders within the term of the contract. The contracts are usually short and there is no security of their renewal. If in dealing with a municipality one were dealing with a business corporation having an established policy, it would be justifiable to take such chances, but our American cities if they have a policy at all change it from election to election, and no contractor can tell that the service which was deemed perfect by the board with which he made his contract, will not be entirely unsatisfactory to its successor with whom he must make a new contract two or three years hence. In this respect we have another lot of educational work cut out for us. If we could make it clear to the mass of our citizens that the price for a year's street lighting depended on whether the street-lighting plant would be employed next year or would be standing idle, we might have some chance to make close bids, without feeling that we were engaged in a risky speculation. The peculiarly exasperating part of the whole subject is that those same theorists who object to asking for bids on a contract running more than two or three years, are usually ready to lock up the good money of the citizens in a city plant which has to be security for 30-year bonds.

Special Sources of Revenue.

In many localities there are opportunities whereby the power of a lighting plant may be employed in work which is not usually considered as part of the lighting business. An arrangement with a manufacturer whereby machinery required by the plant during evening hours will be used by the manufacturer in the daytime is often possible. A similar arrangement is made in many places for the joint use of a water power. The sale of exhaust steam for heating purposes is another source of revenue which is frequently neglected.

How Can Business Be Held When Once Obtained

In these days of competition this subject becomes of the greatest importance. We have against us in every station some competition. In the larger cities we have to meet the offers of opposition companies doing a similar business, the arguments of the man who wants to sell isolated electric plants to our best customers and the ever-present cheap service offered by the gas company. In the smaller towns

and villages the worst obstacle to the holding of business is the tendency of our customers to economize by cutting down the amount of light used. This tendency is present also in the large cities, but is not so constantly in evidence, because many city people must use light liberally in order to carry on their business. The whole law and gospel of holding business consists in getting your customers to believe that they receive good value for their money. It is not sufficient that you should believe it, you must convince the customers. But it tends to make your success more certain if you know in your own mind that you really are giving good value. For this reason it is essential that you know what each block of lighting costs, which brings up again the subject of analysis of expenses.

No matter how cheaply you offer to sell your products, it is essential that the customer is satisfied with what is delivered to him. Therefore if he wants to use arc lights you must see that they are quiet and steady. If he buys current from you wherewith to operate a motor, you must make it your business to see that his motor runs satisfactorily. It is not a part of your contract to do this, but if the motor does not run as it should you will go up there some day and find that he has bought a gas engine. If you sell him current for incandescent lighting, you must see that the lamps are renewed before they become dim. If you cannot get the customer to buy new lamps, you had better arrange to furnish renewals free, as most stations now do. If even then your customer is slow about calling for renewals, you had better send one of your men up to change the lamps. Neglect in this respect probably means that there will be a sale of Welsbach burners in the neighborhood of that customer. You must be prepared to send assistance to him when he mixes things so that fuses get blown, and you must send this assistance promptly. This may mean that a man has to idle around the station waiting for trouble calls, but you should not think that man's idleness gives you a chance to economize by discharging him. You should look upon it as the outward and visible sign that your customers are getting good service. And above all, you must take such precautions that your service may be relied upon by all who employ it. There is nothing that does so much to damage the business of a station as a reputation for unreliability.

Conclusion.

In closing I wish to say that I am preaching no doctrine which I do not believe, or which I do not try to follow. Neither do I imagine that the stations represented in this association are less carefully planned or less efficiently managed than those of the rest of creation, that I should address myself to you rather than to others. But it is by electric light men and no others that the advice must be given to those who need it. And each of us has the opportunity at some time to counsel with the man in the next town of whom we have been speaking. While I was in the act of preparing this paper I was asked for advice in just such a case and gave verbally just the same advice that I was putting in writing for presentation to you. This is a final summary of the opinions I have presented:

(1) The electric lighting business should pay a reasonable profit, approximately the same rate as any manufacturing business which has similar risks. This profit should be paid after the expenses of operation, maintenance and depreciation shown by annual inventory have been provided for.

(2) Rates for electric supply should be so adjusted that each unit sold will pay its share of operating and standing charges and in addition thereto a uniform proportion towards profit. No business should be done at a loss and no business should pay more towards profit than its proper share.

(3) Every class of business that can be profitably done should be obtained. Business that improves the load factor should be taken if it can be obtained at any price greater than its share of operating and standing charges, because the improvement of the load factor reduces the amount of standing charges to be borne by existing load.

(4) Business once obtained should be kept by careful study of and prompt attention to the requirements of each customer. It is not possible in the present stage of electric development for an American electricity-supply company to limit its interest in the supply to its delivery on the customer's premises. It must do much work in order to secure that the customer uses the supply to the best advantage. It is not sufficient that a customer should be well served; he must also be well pleased.

(5) There is need of educational work to be done among electric-light men, among municipal authorities and municipal theorists, and among our own customers. It is to our interest that this educational work should be done, and as it does not appear to be the duty of any other person to do the work, we will have to do it ourselves.

Representative Wheeler has introduced a bill in Congress asking for the sum of $35,000 for the erection of a building and its equipment as an institution of learning, the same to be known as the Morse Memorial Conservatory of Telegraphy, for the double purpose of teaching telegraphy and the perpetuation of the memory of Morse. The bill also carries with it a provision for one perpetual free scholarship, the fund for this to be obtained either through public or private contributions.

American Street Railway Association

T. C. Penington, secretary and treasurer of the American Street Railway association, has issued the following announcement:

The seventeenth annual meeting of this association will be held at the Massachusetts Charitable Mechanic Association Hall, Boston, Mass., September 6, 7, 8, 9, 1898. This early date was chosen by the executive committee as it was the only week until late in December that we could get the hall. Article 7 of the by-laws reads: "Special meetings may be held when ordered by the executive committee." This will be a special meeting, but will take the place of the regular one. We expect to have a very large, if not the largest, exhibit of railway appliances ever shown to this association. Our Boston friends are very enthusiastic, and promise to do all in their power to entertain us while in their city.

The headquarters of the association will be at the Hotel Brunswick. Hotel Vendome is managed by the same parties, and will be used in connection with the Brunswick.

Hotels and rates: Brunswick, American plan, $4 per day and up; Vendome, American plan, $4 per day and up; Copley Square, European plan, $2 per day and up; Nottingham, European, $2 per day and up; Victoria, European plan, $2 per day and up; Turaine, European plan, $2 per day and up; Parker, European plan, $2 per day and up; Young's, European plan, $2 per day and up; Thorndyke, European plan, $2 per day and up.

The first five mentioned are within five minutes' walk of the hall; the others are downtown, with street cars to the door of the hall. The executive committee advises all who desire rooms to apply at once, as the rooms at the Brunswick and Vendome are limited, but no rooms will be assigned until March 15th and will be assigned in the order in which applications are received. Railroad rates will, in all probability, be as before—one and one-third fare for the round trip, due notice of which will be mailed you in time. Papers will be read on the following subjects: "Maintenance and Equipment of Electric Cars for Street Railways;" "To What Extent Should Street Railway Companies Engage in the Amusement Business;" "Underground Electric Roads—Construction and Management;" "Carrying of United States Mail on Street Railways;" "Comparative Earnings and Economy of Operation between Single and Double Truck Cars for City Use;" "How to Care for Return Current;" "Inspection and Testing of Motors and Car Equipment by Street Railway Companies."

The annual dinner will be held at Hotel Brunswick, Thursday evening, September 8th.

CORRESPONDENCE.

New York Notes.

New York, February 9.—A source of constant annoyance to the Metropolitan company since the conduit trolley system was introduced has been the practice of small boys dropping pieces of metal in the slot in the hope of short-circuiting the system. According to a local contemporary, "a small boy was seen the other day poking a tin toy sword down into the slot. Presently he succeeded in bending the end of the sword so that it made a connection from one current-bearing rail below to the other, and then there came a snapping and crackling, accompanied by a great flash of colored light. Part of the current ran up the sword and gave the boy's arm a wrench. He dropped the sword with a yell and went scudding away with a scared expression on his face. Other boys have taking to dropping bits of wire into the slot. When a piece of wire falls so that it touches both electric rails at the same time there is a great flash of light as the current darts across the wire from one rail to the other. When such a thing happens, a man in the power house knows it at once, for at that moment one of the automatic ircuit breakers which he watches pops out with a bang, and if it is at night the lights on the cars go out. The watcher pops the circuit breaker back and everything is all right again."

In addition to the exhibit which will be made by the Walker company of Cleveland, Prof. S. H. Short, its electrical engineer, will make a personal exhibit at the New York electrical exhibition. For 15 years Prof. Short has been actively engaged in railway design and invention, and as far back as 1885 organized a company in Denver which laid and operated a slotted conduit railway. His work will now be interestingly and richly illustrated by pictures, relics, models, old apparatus, etc., and will constitute one of the features of the show that will attract wide attention and help secure for Prof. Short the recognition which certainly is his due.

Mr. F. S. Pearson, the chief engineer of the Metropolitan Street Railway company, is going to travel in Europe for a year. His reputation as an electrical engineer is well established, both in this country and in England, and on the evening of Wednesday of last week he was the guest of honor at a dinner given at Delmonico's by the engineering staff of the Metropolitan company. Mr. Pearson was presented a loving cup, a gold watch and chain and a diamond watch charm. Nearly two hundred guests were present, including gentlemen from Philadelphia, Boston, Syracuse, Montreal and Halifax, and a delegation of Mr. Pearson's old associates in the West End Street Railway company of Boston. Henry D. Macdona was the toastmaster, and the toasts and the speakers were: "A Present from the President," H. H. Vreeland; "Nuggets from New York," John D. Crimmins; "Statistics from Staten Island," Colonel G. B. M. Harvey; "Coals from Canada," W. L. Elkins, Jr.; "Beans from Boston," L. J. Hirt, and "Something from Everywhere," W. H. Knight. There were also remarks by William C. Whitney, the Rev. M. St. C. Wright and others. Mr. Pearson has had much to do with developing the underground trolley system in this city, and has also had much experience in the building of overhead trolley lines. He is consulting engineer for about twenty companies, including some in European cities.

A meeting was held last week, at the office of William C. Whitney, of the stockholders of the Erie Canal Traction company, which has the exclusive right to equip the canals of the state with a system of electrical propulsion, and the following directors were elected: Baron Louis A. von Hoffman, William G. Oakman, Richard S. Hayes, George G. Haven, Thomas C. Platt, Frank W. Hawley, Alfred S. Heidelbach, Commodore P. Vedder and Charlton T. Lewis. Baron von Hoffman was elected president, Mr. Hawley vice-president, and Mr. Lewis secretary and treasurer. All the directors excepting Senator Platt were at the meeting. The Walker company submitted a plan for a system of electrical canal-boat propulsion, which is understood to be looked upon favorably.

During the storm last week ice that drifted out of the harbor on the ebb tide ran afoul of the electric buoys in Gedney's Channel and extinguished the lights. Several of the buoys in the neighborhood of the Hook were carried out of position by the ice-crested tide. A steamer of the lighthouse department picked up the buoys and anchored them in their places.

Electric lights have been substituted for the dingy old oil lamps which formerly served to half light the Fourth avenue tunnel. S. A. M.

Western New York.

Niagara Falls, N. Y., February 7.—The taxpayers of Tonawanda are considering the advisability of establishing an electric light plant of their own and connecting it with the Niagara-Buffalo transmission line for operation. By connecting it with the Niagara-Buffalo power line they would need motors instead of steam engines, and the principle of operation would be very similar to that employed in the Buffalo and Niagara Falls Electric Light and Power company's plant at the Falls.

The Board of Trustees of the village of Tonawanda has taken hold of street railway matters with an iron hand. It has notified the Buffalo, Kenmore and Tonawanda Electric Railroad company that it is $7,200 in arrears on taxes, and that this must be paid or the franchise will be annulled.

It is understood that Lockport will again move in the matter of municipal ownership of a lighting plant, as Mayor Peterson allowed a resolution to stand which makes possible the introduction of the necessary bill in the Legislature this winter.

The Niagara Electrical company of Niagara Falls has secured the contract for installing a lighting plant for the village of Dundee, N. Y.

The promoters of the Penn Yan and Pennsylvania railroad have decided not to use the trolley system in operating their line. Engines equipped with gasoline motors and electric dynamos are to be used. The road will be connected with the Fall Brook line in Penn Yan at the foot of the lake.

An effort is being made to construct an electric road between Mt. Morris and Rochester, the line to be laid in the highway touching Avon and Geneseo. It is estimated that between 13,000 and 15,000 people would become patrons of the road.

It is the intention of the Buffalo General Electric company to use Niagara power for lighting purposes in Buffalo, and, with this object in view, it has awarded a contract to the General Electric company of Schenectady for 11 new step-down transformers. These transformers will have a combined capacity of 2,700 kilowatts, or about 4,000 horse power. They will receive current at a voltage of 11,000 and reduce it for use for lighting purposes.

The Common Council of Lockport, N. Y., has received a proposition from the Niagara, Lockport and Ontario Power company to furnish 15,000,000 gallons of water daily from a power canal for $50,000 a year. The city is authorized to pay this amount for a water supply by special act of Legislature. The charter of the power company was obtained by the Business Men's association, which is now defunct. No decision was reached, but the proposition is under consideration.

Thomas McCarthy of Seneca Falls has brought action against the Light and Power company of that village for $200 damages to his son by a live wire. The boy had climbed to the top of a 10-foot fence surrounding the ball-grounds of Cayuga Lake Park, and in getting over the fence he caught hold of a live wire and was severely burned. Several new questions are involved, and the case is attracting much attention.

At a recent meeting of the directors of the Niagara

Falls Power company two new leases of power and land were authorized. This means that two more manufacturing plants are to locate at the Falls. One of them is said to be a carpet and lace works, to be established by Alexander Morton & Co. This company has English, Canadian and American connections, and its new Niagara plant is expected to employ from 300 to 400 hands, principally women, in the lace department.

The Canadian Niagara Power company has caused the following notice to be published in the Toronto papers: "The Canadian Niagara Power company invites applications for the use of 5,000 electrical horse power within four miles of the railway power house in the Queen Victoria Niagara Falls Park; 300 horse power as direct current is available immediately, 1,000 horse power as alternating current will be ready for delivery May 1, 1898." In this connection it may be stated that Premier Hardy of the Province of Ontario has written to Mayor Hill of Niagara Falls, Ont., stating that the government will not allow the Canadian Niagara Power company any extension of time in which to commence or complete its power installation in Victoria Park. Under the franchise the power company must have 10,000 horse power available by November 1, 1898, and also have water connections made for the development of 25,000.

O. E. D.

Northwestern Notations.

Minneapolis, February 8.—An electric light plant is being discussed at Thorp, Wis.

The council of Hammond, Wis., granted a franchise to Frank P. Crocker for electric lighting, and at the next meeting rescinded it.

The Fox River Valley Inter-urban Railway company will erect a large power house on Doty Island, at Neenah, Wis.

The Fox River Electric Street Railway company of Green Bay, Wis., has been placed in the hands of a receiver. For the last two years the company has been making many improvements and extensions and has been obliged to use its current income to pay for them. It consequently was unable to meet its interest payments. The road was built in 1894 and cost $225,000.

B. F. Gray is arranging to put in an electric light plant at Hitchcock, S. D.

Both Grand Rapids and Centralia, Wis., have canceled their lighting contracts. The five-year contracts with the Central Electric company expired last fall, and each city refused to enter into another long-time contract, but offered to purchase service from month to month. Centralia had been paying $55 per light and Grand Rapids $65, but the company refused to furnish service by the month for less than $72 and on the moonlight schedule. This was refused and the lights have been turned off.

Business men of Miller, S. D., are talking of an electric light system.

The Citizens' Traction company of Oshkosh, Wis., is arranging for a three-mile extension of its line to a new park.

Linemen who were stretching a wire across Hennepin avenue, Minneapolis, from one building to another, dropped it to the trolley wire of the street railway, and the result made things lively for a few minutes. The trolley wire broke and dropped, striking a heavy draft-horse, and the current knocked it down. Street-railway traffic was interrupted for a short time, but, aside from this, no further damage was done.

The city of Centerville, Ia., is in a turmoil. In 1890 a local lighting company was formed and a plant put in. This finally got into control of outsiders who took all the income and made no improvements on the plant, but rather allowed the service to deteriorate. Citizens grew tired of it, and recently some leading local capitalists were invited to make an offer for electric street lighting. An ordinance was introduced in the council to grant the new firm a franchise and it reached the third reading, when the old company took a hand. The ordinance was voted down. The old company was granted a 12 year contract at $3,774, although the new company offered the same service at considerably less. The proposition was accepted and given three readings and passed, all within two hours. The people are up in arms about it. The mayor will veto, but the council can pass it over the veto unless some of the aldermen experience a change of heart.

A communication has been presented to the City Council of Waterloo, Ia., stating that the trolley-car lines are affecting water and gas pipes with electrolysis. A section of pipe which, six feet underground, had passed under the rails, accompanied the letter. It was perforated like a sieve. The communication was referred to a committee, which will confer with the street railway company as to the best manner of avoiding this.

C.

PERSONAL.

George A. McKinlock, president of the Central Electric company, is in New York this week.

Max Osterberg has been engaged by the Electrical Exhibition company of New York as construction engineer.

H. C. Thomson of the Electric Gas Lighting company of Boston was elected manager of that corporation at the annual meeting of the company.

O. P. Sells, formerly of New Orleans, is now engaged in electrical and mechanical engineering work in New York. Mr. Sells left New Orleans during the "fever scare" and found the outlook in New York so much better that he determined to remain for a time at least in that city. At present Mr. Sells is rebuilding the electric plant in the Windsor.

ELECTRIC LIGHTING.

The War Department, through the United States engineer at New London, Conn., is inviting sealed proposals until March 3d for an electric lighting and power installation at Great Gull Island, N. Y. Specifications and full information regarding the work will be furnished intending bidders upon application to Major Smith S. Leach, New London, Conn.

Favorable reports are at hand from manufacturing and illuminating companies indicating a waning in the popularity of the Welsbach burner. Customers are returning to the incandescent lamp, tired of the expense involved in renewing shattered mantles and worn out with the ghastliness of the light. Additional proof is furnished by the production and sales reports of the different manufacturing companies, which show a constantly increasing demand for incandescent lamps, as well as for arc lamps, especially those of the enclosed arc type. In stores, restaurants, cafes, hotels and halls, where the Welsbach burner secured temporary success, the enclosed arc lamp is rapidly bringing back the use of electricity, while in new establishments the Welsbach burner is not finding much foothold.

ELECTRIC RAILWAYS.

A receiver was appointed at La Porte, Ind., February 3d, for the Michigan City Street Railway company, which is owned by Russell Harrison. The liabilities are estimated at $40,000. No statement was made as to the assets.

The Maryland and Washington Railroad company in its annual report to Congress, through its receiver, says its paid-up capital amounts to $20,000. No dividends were paid during the year. The funded debt is $430,000.

At the annual meeting of the Englewood and Chicago Electric Railway company, February 7th, that company ceased to exist in name. The master's deed of the property was turned over to the Chicago Electric Traction company, the new corporation recently formed by the Englewood and Chicago reorganization committee, which purchased the latter road at the master's sale. Officers of the Chicago Electric Traction company were elected as follows: President, Jules S. Bache; vice-president, Samuel R. Shipley; treasurer, Henry Lewis; secretary, H. A. Hinsley.

The consolidation of all the trolley roads of New Jersey under the name of the Union Traction company is anticipated. The last step taken was the cessation of hostilities between the New York and Philadelphia and the Brunswick traction companies. These two companies have been at loggerheads for some time over securing a right of way through the town of Bound Brook. Another gap in through lines recently filled was at Millburn, through which the North Jersey company has at last secured a right of way. Franchises are now held by the various companies for through lines between New York, Greenwood Lake, Easton and Philadelphia.

The suburban trains of the Chicago, Milwaukee and St. Paul Railroad company will soon be operated by electricity instead of steam engines. President Louderback of the Lake Street Elevated Railroad company gave testimony to this effect while on the witness stand in a recent lawsuit. Mr. Louderback confirmed the announcement later, stating that contracts for furnishing electric power had been entered into with the North and West Chicago Street Railroad companies. He stated that the necessary ordinances had not yet been secured, and for that reason he declined to make public any of the terms of the contract. It was recently rumored that the Milwaukee company sought a franchise to substitute electricity for steam on its line between Chicago and Evanston, but it now appears that franchises are wanted for all the company's suburban lines running out of Chicago.

Articles of incorporation have been filed by the Los Angeles-Pacific Railway company. The company is formed for the purpose of consolidating the capital stock, debts, property, assets and franchises of the two corporations known as the Pasadena and Pacific Railway company of Arizona, and the Pasadena and Pacific Railway company of California to build and operate railroad lines between Los Angeles and Santa Monica, with branch lines running to Hollywood, Laurel Canon, South Santa Monica, Santa Monica Canon, and the Soldiers' Home. It is also the purpose to build telegraph and telephone lines along the main road and branches. The estimated length of all of the roads is 100 miles. There are 13 stockholders, each subscribing to five shares. The names are as follows: E. P. Clark, J. H. Spires, William D. Larrabee, Warren Gillelen, R. F. Jones, A. I. Smith, Milton E. Hammond, T. C. Paxton, M. H. Sherman, J. M. Copes, B. W. Pratt, W. C. Durgin and John D. Pope, all of whom are to act as directors for the first year. William M. Buffum, as trustee, subscribes to 9,935 shares. The amount of capital stock is fixed at $1,000,000, $100,000 of which has been paid up, divided into shares of $100 each. The main business offices will be located in Los Angeles. This system of electric roads is now in operation with the exception of one or two small feeders. The proposed consolidation of securities is for the purpose of unifying the management and to make possible further extensions and improvements.

Edmund Saxton, the contractor who is now engaged in doing the street work in connection with the installation of the underground electric system on the Pennsylvania avenue and Fourteenth street lines of the Capital Traction company of Washington, D. C., is going over the lines of the Eckington and Soldiers' Home railway, for the purpose of making an estimate of the cost of putting the underground electric system on this line. He has been invited to do this by Mr. O. T. Crosby, who is a member of the syndicate that some months ago acquired the controlling interest in this road, as well as in other street railroads. Mr. Saxton will submit an estimate of the cost of the work, and it is thought that the installation of this system within the limits of the city, and the improvement of the overhead trolley section of the road, which extends beyond the city limits, will involve an expenditure of over $1,000,000. Mr. Crosby states that it is the intention of those now controlling this property to operate all the city lines of the road by the underground system. It is stated that this system will be installed as soon as the necessary legislation asked from Congress has been obtained. A bill is now pending providing for the consolidation of the Eckington and belt railroads and the Washington and Maryland (a portion of the boulevard line between Washington and Baltimore). When these properties are united it is the purpose of the owners to issue bonds secured by a mortgage on the entire property, and with the money thus secured to equip the city lines with the underground system, and perfect that portion outside the city bounds which is to be operated by the overhead trolley.

TELEGRAPH.

The opening of a new cable line via Turks Island and Bermuda, giving the United States and Canada a competitive route for cablegrams to the West Indies, was celebrated on January 31st. The new cable connects with the service of the Commercial Cable and Postal Telegraph companies.

At the request of the secretary of state, the acting attorney-general has given an opinion on the question of the authority of the president, in the absence of legislation in the matter, to control the landing of foreign telegraphic cables. The question was raised by the action of the French Cable company, in landing a cable at Cape Cod without the express permission of Congress or the president. Mr. Richards' conclusions are as follows: That the president has the power, in the absence of legislative enactment, to control the landing of foreign submarine cables. He may either prevent the landing, if the rights entrusted to his care so demand, or permit it on conditions which will protect the interests of this government and its citizens; and if a landing has been effected without the consent or against the protest of this government, respect for its rights and compliance with its terms may be enforced by applying the prohibition to the operation of the line unless the necessary conditions are accepted and observed.

POWER TRANSMISSION.

A St. Petersburg company for the transmission of power from waterfalls has recently been organized in Russia to build plants for the utilization of the Narowa, Imatra and Wuozen waterfalls in the generation of electrical power, and to transmit and distribute it in St. Petersburg and surrounding districts for electric lighting and power purposes. The capital of the company is $2,000,000.

A development of water power for electrical transmission is contemplated by a company of New York and Pennsylvania capitalists, who have acquired control of the Chattahoochee River for 16 miles. The purpose is to build three plants and a stone dam at each of the places. The fall from Jones Shoal to Bull Sluice, a distance of 13 miles, is from 75 to 80 feet. This part of the river will be a continuous lake, broken only by one dam. It will vary in width from 500 feet to one mile. The three dams will furnish 11,000 horse power. The purpose is to furnish electrical power for machinery placed upon the Southern railway from Atlanta to Norcross for manufacturing purposes. The incorporators of the company are Henry B. Wilson and Emerson McMillin of New York, C. Emerson Smith of York, Pa., and R. H. Smith of Gainesville, Ga. It is announced that at least $1,000,000 will be invested in the enterprise.

ELECTRICAL SECURITIES.

The quarterly statement of the Staten Island Rapid Transit company shows net earnings of $81,973, with charges of $82,933, a deficit of $960. Last

year for the corresponding period the deficit was $33,805.

The Charlestown Gas and Electric company declared a semi-annual three per cent. dividend February 1st.

The Edison Electric Illuminating company of Boston reports gross earnings for the year 1897 of $879,949, an increase of $106,471. The net earnings were $339,828, an increase of $64,648.

The board of directors of the West Chicago Street Railroad company has declared a quarterly dividend of 1½ per cent. on its capital stock, payable February 15th. Transfer books closed February 5th and will reopen February 16th.

The Brooklyn Railroad company reports net earnings of $450,093.78 for the quarter ended December 31, 1897, as compared with $430,372.93 during the corresponding period of 1896. The balance sheet shows cash on hand $292,523.17.

An advance of 3¼ in General Electric during last week is noted. A financial authority offers this explanation: "The advance in General Electric is explained by the increasing demand for electrical appliances, particularly from transportation companies."

The Alexandria, Mount Vernon and Washington Railroad company reports a paid-up capital of $500,000, a funded debt of $700,000 and a floating debt of $19,682.12. The number of passengers carried in the District during the year was 924,145. No dividend was declared last year.

The capital stock of the Eckington and Soldiers' Home Railroad company is $652,000, of which $581,600 is paid up. No dividends were paid during 1897. The number of passengers carried during the year was 3,931,999. The expenditure for the year was $123,182.91, or $25,067.61 more than its receipts.

The Belt Line Railroad company of Washington reports $222,972 paid in on a stock of $500,000. Five thousand and three of the 10,000 shares of stock are held by the Central Trust company of New York. The total earnings of the year were $71,983.46; the expenses, $89,761.48, or an excess of $17,778.02.

The total gross earnings of the Brooklyn Rapid Transit company's system for the month of January were $414,809.66, an increase of $22,523.85 over the same month of 1897 and $32,366.99 over January, 1896. For seven months ended January 21st the gross earnings were $3,220,150.06, as compared with $3,129,565.62 for 1897 and $2,971,042.54 for 1896.

MISCELLANEOUS.

A new tariff went into effect in Tasmania on January 1st, and under its provisions electric light cables and insulators are subject to a duty of 10 per centum ad valorem.

The bill granting right of way to and construction of a railway, telegraph and telephone line through the Indian Territory to the Denison, Bonham and New Orleans Railroad company of Texas has been reported back to the Senate with some slight amendments.

The Vera Cruz, Mexico, custom house has been supplied with electricity from the town, and connected with the local telephone system. An electric plant has been ordered from England, with a searchlight of 12,000 candle power to illuminate the bay, and incandescent lamps for use in the government building.

A Detroit dispatch in a New York paper states that the entire product of the Champion iron mine of Champion, Mich., has been contracted for by a New York concern. The Champion is supplying solid slabs of magnetic iron ore which are being used to replace platinum as anodes in the collection of chlorine gas. The magnetic oxide slabs have been proved practically indestructible, and are better adapted for this use than any agent thus far discovered. Sixty tons have been exhausted in the experiments at New York. Heretofore Russia has furnished the magnetic oxide, but the Russian product is said to be inferior to the Michigan ore, and the expense of importation has greatly handicapped the chlorine-gas makers.

TRADE NEWS.

The Otto Electric company of New York announces that it has secured the American agency for the Cox thermo-electric generators.

Mr. F. H. Clark, manager of the Chicago office of the Electric Storage Battery company, has closed a contract with the Patten Motor company for four equipments of 100 cells each.

A booklet especially prepared "for guys" is the latest production in the way of a circular which is being distributed by the Leschen Macomber-Whyte company. It is said to have come of an inspiration received during Mr. Whyte's recent trip to foreign shores.

Royce & Marean of Washington, D. C., have just moved into new quarters at 1423 New York avenue, where they have one of the largest and best equipped stores for electrical supplies to be seen in the South. This change was necessitated by the growth of their business.

The Kokomo Telephone and Electric Manufacturing company of Kokomo, Ind., has just moved into its new home. The factory and offices occupy a building 30 by 100 feet, two stories high, of brick and stone, on the corner of Main street and Broadway, one of the finest locations in the city.

The number of arc lamps manufactured and shipped from the factories of the General Electric company within the last fiscal year exceeded 24,000. Many thousands of the G E enclosed arc lamps are now in service, and the introduction of the alternating enclosed lamp has still further increased the sales.

General Manager Herbert Lloyd of the Electric Storage Battery company of Philadelphia reports that the business of the last year was more than double that of 1896, and the prospective business is far in excess of that of any former period. This pleasant condition of affairs must be particularly pleasing to Mr. Lloyd, who has been such a tireless worker in promoting the interests of the company.

The Stromberg-Carlson Telephone Manufacturing company reports a steadily increasing demand for the inter-comunicating systems, as well as the public exchanges and toll-line apparatus which it makes. Among its recent orders for private-plant equipment is the fourth from the Pennsylvania Railroad company for the offices at Fort Wayne, Ind.

General Manager C. E. Trump of the Novelty Electric Works of Philadelphia has reason to feel gratified from the business of the last year, as it showed a steady increase each month, especially in November and December, at which time more business was done than at any time since the concern was organized. The reputation of honorable dealing with customers, which has always been maintained by the Novelty Electric Works, has always commended it to the electrical trade.

Partrick, Carter & Wilkins of Philadelphia have started with bright prospects under their new name. It is a debatable question if this concern will not have to move from the present quarters, if the business continues to show the growth which it has for the last few months. Treasurer Charles M. Wilkins, who has the management of the business details, reports that from all indications the coming year will be one of the best known to the business. They have under way many electrical novelties which will be offered to the trade.

The Michigan Pipe company of Bay City, Mich., manufactures creosoted wood conduits for underground wires, cross-arms, poles and railroad ties. It uses the Bethell process, it explains, "because the experience of engineers in Europe and America has proved that timber treated with dead oil of coal tar or creosote has withstood the ravaging effects of time and storm better than timber treated by any other process." It has prepared for circulation a very interesting document upon this subject which will doubtless prove valuable to persons interested in the matter.

The American Coffee company of Brooklyn is erecting a new power house in connection with its plant, which is about 70 feet wide and 120 feet long. The power house and boiler house have brick side-wall construction and steel supports and roofing. Adjoining the boiler house is a coal bunker about 20 feet wide, which carries the supply of coal in a steel bin about 30 feet above the ground. The whole plant has been designed with convenience and economy in view, and when completed will be a notable plant, which can be economically operated. The contract for furnishing and erecting the steel farmework of the building has been let to the Berlin Iron Bridge company.

The Central Electric company has taken the western agency for the Erickson outlet insulator. This insulator is brought out to meet the demands of engineers for a thorough and perfect protection at the ends of iron-armored conduit outlets. It very effectually and thoroughly prevents possible grounding of the wires on the iron conduits, and has met with a very ready sale. The company is carrying complete stocks of Insulac and Armalac, for the insulation of generators, motors and all kinds of high-potential work. These two compounds are fast establishing a reputation for permanency and absolute reliability. The new extra B. B. iron box bell, introduced and handled by the Central company, has proven to be one of the best specialties ever introduced into that branch of the electrical business. Its many new electrical and mechanical features commend it to cautious purchasers.

The Bliss School of Electricity at Washington, D. C., is now in the sixth year of its existence. It was founded by President Louis D. Bliss. The student is first given primary instruction along purely theoretical lines to a point where it can be supplemented by practice, and by restricting the course of study to electricity it is possible for the student, by following the work laid out, to receive a diploma at the end of one year. The school is pleasantly located on B street, N. W., handy to the various reference libraries of the city. The building includes a lecture hall, construction laboratory, dynamo room, drafting department and reading room. There is a post-graduate course which embraces advanced mathematics, mechanics, general electrical engineering work, and a deeper study into the theory of electricity than is expected in the regular course. The fact that the pupil upon leaving this school has received the practical education of building electrical apparatus is of great advantage when seeking employment. This year 22 states of this country, as well as Canada and Cuba, are represented by pupils in this school. The increase of students has been very large of late.

BUSINESS.

A letter opener which is made of tempered copper is a reminder from the Mansfield Tempered Copper company of Mansfield, O., which makes special claims for its product and enjoys a very extensive trade among the electrical fraternity.

The Western Electric company manufactures a very superior disk LeClanche porous cup cell especially adapted for bell and annunciator work. The company makes the battery complete, but will furnish the porous cup without zinc or glass jar if desired.

W. R. Garton has opened an office at 414 Ashland block, Chicago, where he will represent the Garton-Daniels Electric company, the Pittsburg Steel Hollowware company, the Massachusetts Chemical company and other eastern manufacturers. He will sell B. & S. drop-forge commutator bars and electric railway supplies in general, but will not give any attention to minor supplies or repair parts. Mr. Garton is a stockholder in the Raster Carbon Rheostat company, as well as consulting engineer for the same concern, and was also elected general manager of the Garton-Daniels Electric company at the last stockholders' meeting.

A new electric hoist designed and manufactured by the Denver Engineering Works company has proved successful in operation. The company has shipped one of the largest size to the Bushwhacker mine at Aspen, that is working very well, and another to the Hidden Treasure mine, and is now shipping four more, with an electric power plant, to Mexico. The company has this week booked orders for a seven-foot double-deck roasting furnace for Montana, one double mine timber-framing machine for Arizona, an electric-lighting plant of 1,200 lights for New Mexico, and a lighting plant for one of the largest public buildings in Denver, the lighting plants being furnished with the new Denver automatic engine.

A representative of the Western Electrician recently visited the works of the Partridge Carbon company in Sandusky, O., and found them exceedingly busy. The Partridge company has recently shipped an order of 19,000 street-railway brushes to Antwerp; it has also on the books another handsome shipment for London. Manager Speer reports that the factory is behind on orders, and, to quote Mr. Partridge's own words, they are working "night and day and cannot keep up." From the start the Partridge Carbon company has pursued the policy of producing the best goods at fair prices, and now that good times are again commencing the effect of this policy is being felt in the most gratifying manner. Under Mr. Partridge's personal management improvements in manufacture are being made, and it is now reported that before long the Partridge company will have a surprise for the trade.

A representative of the Western Electrician, during a visit to the works of Broomell, Schmidt & Co., limited, the manufacturers of the celebrated American fuel economizer at York, Pa., found the establishment one of the best designed and most complete manufacturing plants he had ever examined. The works are situated on the Pennsylvania railroad, with a switch running the entire length of the plant. Substantial buildings, consisting of a machine shop, foundry and boiler shop are equipped with the very latest tools, quite a number of which are special machines built exclusively for the manufacture of the American fuel economizer. In the erection of this plant the comfort and convenience of the employes have been looked after much more than ordinarily. Bath rooms and wash rooms are provided, all of which are heated and ventilated in the most perfect manner. A complete hydraulic plant is included among the other special fixtures, and consists of hydraulic cranes, elevators, presses and special attachments for putting together and testing economizer sections. Some very large economizers are now in course of construction at the works, and piles of sections are stacked up 30 feet high under hydraulic cranes awaiting shipment. The American fuel economizer has many points of superiority, and the manufacturers claim that it is the best economizer in the world. Messrs. Broomell, Schmidt & Co. have recently issued a new catalogue devoted exclusively to the economizer business, and will be pleased to send it to those interested in the subject. In this age of economy and close figuring no large steam user can afford to be without an economizer, and managers of large electrical and steam plants will do well to correspond with Broomell, Schmidt & Co. in regard to the American fuel economizer.

ILLUSTRATED ELECTRICAL PATENT RECORD.

Issued February 1, 1898.

598,092. Alternating Current Motor. Alexander Heyland, Frankfort-on-the-Main, Germany. Application filed December 29, 1896.

The method of producing phase difference between the two inducing circuits of an alternating current motor consists in causing one of the circuits to be powerfully affected by the reaction of the secondary member of the motor, while reducing the effect of the reaction upon the other circuit.

598,106. Fusible Cut-out. Ernest A. Lowe, North Plainfield, N. J. Application filed March 5, 1897.

A box of insulating material having a partition at one end and holes through which the circuit wires pass, and recesses or stops at the other end, in combination with spring electrodes to which the circuit wires are permanently connected, such electrodes being held between the stops and within the box, a removable plug recessed at the side and having holes for the reception of the ends of the fusible wire, and adapted to be inserted into the open ends of the box and between the spring electrodes.

598,109. Insulating Attachment for Electrical Connectors. Richard P. Osgood and John D. Osgood, Methuen, Mass. Application filed June 28, 1897.

An insulating attachment for an electrical connector is described, comprising a rigid tubular jacket of non-conductive material and of shape to inclose the connector, and tubular elastic tips of non-conductive material each adapted to have one end stretched around one end of the jacket and the other hug closely around the wire, whereby a waterproof connection is made between the wire and the jacket at each end.

598,160. Electric Fire Alarm, Circuit and Signal Box. Lewis G. Rowand, Camden, N. J. Application filed January 5, 1897.

One claim is given: In an electric fire-alarm system, a main-line circuit, a plurality of boxes each having signaling devices in circuit with the main-line circuit, a spring-actuated wheel for operating the signaling devices, an escapement connected with said wheel, an adjustably weighted escapement pawl operating with the escapement, an electro-magnet in circuit with the signaling devices, a device carried by the armature adapted in the retracted position of the armature to lock said escapement, a wheel in connection with the spring-actuated wheel provided with a detent, a projection carried by said armature adapted in the retracted position of the armature to enter said detent.

598,172. Telephone System. Charles A. Barron, Robert T. Reid and James L. McDonnell, Tacoma, Wash. Application filed April 5, 1897.

Where there is a party-line a switch should be provided for each telephone, an electro-magnetic locking device for each switch and included in a normally closed local circuit, and means whereby to maintain the circuit of the locking device open-circuited when the lever is in use, whereby to prevent all of the switches except the one belonging to the telephone in use from being closed.

598,180. Apparatus for Electrolytically Producing Zinc. Carl Hoepfner, Giessen, Germany. Application filed October 7, 1893.

An electrolytic apparatus is employed, comprising a vessel containing a zinc chloride solution, a suitable insoluble anode and a discoidal revoluble cathode, the latter dipping partly into the solution, means for preventing chlorine bubbles formed at the anode from coming into reactive contact with the cathode, and electrical connections between the anode, the cathode and the source of electricity respectively.

598,183. Telephone System. Robert T. Reid and James L. McDonnell, Tacoma, Wash. Application filed May 7, 1897.

Provision is made for a combination with two line conductors and a source of electrical energy of a series of telephone apparatus arranged between the line conductors, each apparatus comprising a telephone and a lock-out device arranged in parallel between the line conductors, the circuit of the lock-out device being of higher resistance than the telephone circuit, a switch common to both circuits and arranged to maintain both normally open, and a resistance included in the line circuit.

598,184. Conductor for Electric Railways. Georg Ritter, Stuttgart, Germany. Application filed October 16, 1896.

In a three-wire electric railway system there is the combination with a series of pairs of contact devices capable of vertical movement, the contact devices being beveled on their lateral faces in opposite directions, of a car, and a shoe carried by the car and provided with a beveled end, whereby the contact devices will be alternately raised or depressed.

598,193. Apparatus for Electro-deposition of Gold and Silver. Emile Andreoli, London, England. Application filed October 1, 1895. Patented in England September 4, 1895.

In apparatus for the electro-deposition of gold, silver or other metal, anodes of peroxidized lead acting in the presence of and in combination with a cyanide or cyanide-compound solution are employed.

598,198. Electric Lamp for Bicycles. Peter A. Dowd, Boston, Mass. Application filed July 10, 1897.

An electric lamp carried by a bicycle and a current generator for the lamp comprising permanent field magnets attached to the bicycle frame, side pieces of non magnetic material attached to the field magnets, an armature journaled in the side pieces, and a friction disk or wheel secured to the armature intermediate of the field magnets to engage the periphery of the bicycle wheel and equalize the friction on the armature journals.

598,199. Mechanism for Starting, Stopping and Controlling Speed of Motors of Electric Cars. Frank H. Foster, Brooklyn, N. Y. Application filed Augu[illegible]

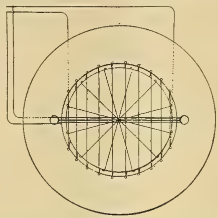
The combination [illegible] with an electric motor, a current controller therefor and means through which an electric current may be passed to them, of an electro-magnet, a conductor for leading an electric current thereto, a switch through which the flow of this current may be permitted and interrupted as required and mechanism intermediate the electro-magnet and the controller, whereby the controller may be automatically operated from the electro-magnet to start and control the speed of the motor when the switch is operated in the required direction.

598,208. Electric Meter. Carl D. Raab, Kaiserslautern, Germany. Application filed December 30, 1896. Patented in Germany April 12, 1895; in France December 11, 1895, and in Austria June 26, 1896.

A motor wattmeter for alternating current is provided with one or more metallic rotary armatures acted upon by two sets of magnetic fields having each a difference of current phase, one of the sets being produced by the main or direct current and the other by two shunt currents.

598,209. Electric Meter. Carl D. Raab, Kaiserslautern, Germany. Application filed June 24, 1897. Patented in Belgium February 27, 1897.

A motor wattmeter for alternating currents having a rotary armature without current supply and a coreless solenoid, in combination with two coreless shunt field coils of like polarity so arranged as to form a common magnetic field.



NO. 598,092.

598,218. Adjustable Support for Incandescent Lamps. William J. Going, Amsterdam, N. Y. Application filed May 26, 1897.

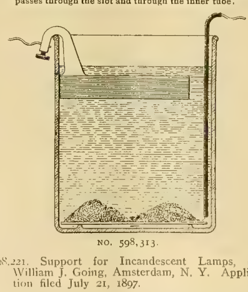
In an adjustable support there is the combination of a bracket having a hemispherical cavity, a ring swiveled on the outer edge of the bracket, a part extending between and journaled in diametrically opposite sides of the ring, and a rod threaded on one end and extending through the part and adapted to bear upon the wall of the cavity.

598,219. Support for Incandescent Lamps, etc. William J. Going, Amsterdam, N. Y. Application filed July 21, 1897.

A yoke is swiveled on a bracket to turn universally and is provided with a threaded aperture, and a rod having a threaded end passing through the aperture and adapted to bear upon the curved bearing surface of the bracket to hold the yoke from turning.

598,220. Support for Incandescent Lamps. William J. Going, Amsterdam, N. Y. Application filed July 21, 1897.

A portion of a disk is fulcrumed on the spindle at right angles to the axle of the disk; a yoke is swiveled on the spindle to move universally; a tube having a threaded end passes through the free end of the yoke, the tube being slotted longitudinally; a tube within the outer tube is connected to the latter through the slot, and a conducting cord passes through the slot and through the inner tube.



NO. 598,313.

598,221. Support for Incandescent Lamps, etc. William J. Going, Amsterdam, N. Y. Application filed July 21, 1897.

Claim is made for the combination with a bracket provided with a spherical socket, of a ball within the socket having a threaded aperture extending therethrough, and a threaded tube extending through the aperture and adapted to bear upon the sperical surface of the socket, the tube being slotted longitudinally, a tube within the outer tube connected to the latter through the slot and adapted to slide therein, a friction device to slide on the exterior of the outer tube, and a lamp carried on the end of the outer tube.

598,260. Electrical Conductor. Louis C. Werner, Broadbrook, Conn. Application filed June 15, 1897.

An electrical conductor extends along a line of way and has a bent portion out of alignment with the body of the conductor, supporting means for engaging the bent portion and supporting the conductor, and a conducting bridge-piece spanning such bend and in alignment with the body of the conductor.

598,269. Polarized Signal Bell. Frank R. McBerty, Downer's Grove, Ill. Application filed November 24, 1896.

The combination is described with a polarized magnet and a centrally pivoted armature therefor, of a tube of copper surrounding the armature and a helix surrounding the tube of copper, the helix being connected with the circuit of the magnet and being adapted to neutralize the magnetic effect thereof on the armature.

598,271. Brush-holder. August J. Oehring, Chicago, Ill. Application filed June 30, 1896.

In a commutator brush-holder for dynamo-electric machines there is the combination with the commutator brush of a dog bearing laterally upon the brush, and a spring actuating the dog to hold the brush securely in position.

598,272. Instrument-winding Device. August J. Oehring, Chicago, Ill. Application filed October 12, 1896.

An armature core is secured in position by a chuck, and a shaft projects from the armature core, the shaft having a tapered guiding portion at an outer end thereof, whereby wire may readily be guided into position upon the core about the shaft.

598,273. Instrument-winding Device. August J. Oehring, Chicago, Ill. Application filed November 28, 1896.

Means are provided for winding coils of wire upon the armature core, with automatic means for discontinuing the winding of each coil when a predetermined number of turns have been received thereby.

598,276. Self-restoring Annunciator. Josef Steiner, Brooklyn, N. Y. Application filed May 23, 1896.

Cores are mounted upon the retaining plate, the annunciator drop is journaled in the ends thereof and comprises the armature, target, plate, and the screw securing the several parts of the annunciator drop together.

598,285. Telephone Apparatus. Frank B. Cook, Chicago, Ill. Application filed March 25, 1895. Renewed September 16, 1897.

A sectional switchboard consisting of a frame and removable and replaceable switchboard sections, each one of which is equipped with suitable apparatus including cords, plugs and switches, whereby each section may be connected by the apparatus mounted on the section to any other section or other switches.

598,313. Electro-deposition of Lead. Ernest P. Clark, New York, N. Y. Application filed June 8, 1897.

The process of producing finely divided lead consists in first partially changing an acetate-of-lead solution into an acetate-of-zinc solution and then depositing lead by passing a current of electricity from a lead anode through the solution to a cathode.

598,316. Electric Gas-lighting Apparatus. Christian Eickmann, Indianapolis, Ind. Application filed July 3, 1897.

In a gas-igniting machine means are provided for connecting the explosion chamber with a furnace, the priming valve is adapted to conduct gas from the supply pipe to the chamber, the electrode in the chamber is electrically connected, the main supply valve is connected to the pipe, and means are connected with the valve and the electrodes by which a circuit is formed and broken to throw off an igniting spark.

598,318. Electric Furnace. James E. Hewes, Philadelphia, Pa. Application filed April 27, 1897.

Provision is made for a chamber into which the material is fed, a reciprocating rammer for expelling material from the chamber, pencil-holders pivotally supported on each side of the outlet of the chamber, and circuit connections for the pencils.

598,328. Terminal Head for Electrical Conductors. Charles H. Sewall, Chicago, and Henry E. Procunier, Oak Park, Ill. Application filed August 22, 1896.

A stem of conducting material forming part of an electric circuit projecting from the outside surface of a base or holder and surrounded by a non-conducting bushing, a metallic connector mounted on the bushing, means for interposing another part of an electric circuit to complete upon one side of base or holder the circuit between stem and connector.

598,358. Electric Circuit Controller. William T. Budds, Charleston, S. C. Application filed August 30, 1897.

An electric circuit controller comprising a wheel of conducting material having peripheral projections on its body portion, and a plain segmental portion at one side of less length circumferentially than the body portion, and the wheel being cut away at one side of the segmental portion, the area of the cut-away portion being equal to that of the segmental portion.

598,408. Machine for Making Type Bars. Benjamin F. Bellows, Cleveland, Ohio. Application filed May 21, 1894.

By an arrangement of diverging distributing channels and dividing partitions by which the number of the channels is increased from the top downward, pivoted switches are arranged and connected in rows in the channels; electro-magnets are adapted to severally operate the rows of switches, with a distributing trough having an opening through which communication is had with the distributing channels; pins are connected in the several electric circuits, and matrices are adapted to engage with the pins and thereby complete the magnetic circuits.

598,410. Fire and Burglar-alarm System. Charles P. Bostian, Milton, Pa. Application filed April 27, 1897.

Claim is made for the combination with a signal wheel and contact spring of the stop-lever, mechanism for throwing the stop-lever out of the path of the pin, including three slotted links, a vibratory lever engaging two of the links, an arm connected with the lever, an inflammable cord connected to the arm, a manually operated cord also connected to the arm, a lever engaging the slot of the third link, a spring for operating the lever and a thermostatic detent for the lever.

Western Electrician.

EVERY SATURDAY.

Vol. XXII. CHICAGO, FEBRUARY 19, 1898. No. 8

Modern Lights in Ancient Fittings.

At the dinner of the Fellowship Club at Kinsley's on Monday evening the decorations of the banqueting room merited and received especial attention. The room was transformed into a Turkish apartment for the occasion—that is, the walls and ceiling were thus decorated; the table equipage was quite modern and Occidental. The hangings of the hall and balconies were of rare old Turkish rugs, tapestries and fabrics. Turkish lamps, plaques, shields and arms were disposed with artistic skill and excellent effect, and the whole arrangement was very pleasing. Some of the pieces used are supposed to be 500 years old and were of great value. The collection was selected from the stock of Marshall Field & Co. and draped with much taste by the designers of that establishment. The Oriental stuffs and bric-a-brac employed were insured for over $40,000. An especially noteworthy decoration was a framed Aubusson tapestry, "The Montenegrin," copied from a painting with rare delicacy.

In the center of the room was a mimic pond, banked with moss. The water was represented by a mirror, and on it were pond lilies, while about the margin were English yellow primroses, daffodils, hyacinths and umbrella plants. In the asparagus at the edge some 60 miniature incandescent lamps were concealed.

In harmony with the general design the lighting effect was subdued. The curious old Turkish lamps and lanterns encased colored incandescent lamps, and the dim light from them added greatly to the effectiveness of the interior. The word "Fellowship" was outlined in varicolored miniature lamps over the entrance to the room. In all about 300 lamps were specially wired and placed for the occasion. Current was taken from the isolated plant in the building, and the extra electrical work was executed by the Chicago Edison company.

Fifty-year Franchise Wanted.

The Danville Gas, Electric Light and Street Railway company is attempting, under the Allen law, to secure a 50-year franchise from the City Council. The company's franchise was granted seven years ago, and it has 13 years to run. At the last session of Congress a bill was passed locating a soldiers' home at Danville. The grounds selected are three miles east of the city and a mile and a half east of the present terminus of the street-railway company's lines. The corporation desires to extend its tracks to the soldiers' home and double its tracks through the city to its present eastern terminus. To do this, it is claimed, it will require $50,000, which must be raised by bonds to be sold in New York. It is also claimed that eastern capitalists will not advance the money on a franchise that has only 13 years to run.

The part of the line to be constructed runs through the village of Germantown and in the country. For that part last summer the company obtained a 50-year franchise. There is much opposition to granting the 50-year franchise for the Danville portion of the line, and the mayor, E. R. E. Kimbrough, will veto the ordinance if one is passed. There are 14 aldermen in the council, and to pass the ordinance over his veto will require 10 votes, which, it is believed, is more than the street-car company controls.

The company claims that the street-car line is now operated at a loss. It also runs the gas and electric-light plant. For the year ended December 31, 1896, the street-car company's net profits are stated to have been $45,856, but this is said to have been due to profitable lighting contracts and not to the transportation business.

Chicago City Railway's "L" Project.

The plans of the Chicago City Railway company to build an elevated line from Thirty-ninth street to the river, to relieve the congestion of traffic upon the surface lines in the downtown business district of Chicago, have attracted considerable attention and provoked much comment, favorable and otherwise. It is universally admitted, however, that there is urgent need of relief and that the surface lines at present are taxed to their utmost capacity, but property owners on Dearborn street are opposed to the project. The grounds upon which objection is based are those which would be raised against any elevated structure or other additional occupancy of that busy thoroughfare.

President Bowen of the Chicago City Railway company authorizes the statement that the new enterprise will be part of the South Side system and that the plans are now being prepared under his direction. "The congestion of traffic upon the surface lines made some such step absolutely necessary," said Mr. Bowen. "Our north-bound cars are crowded before they reach the business district during certain hours of the day, and there is much inconvenience and delay caused by frequent stopping to allow passengers to alight. If we can arrange to bring the patrons of the company who live in the extreme southern part of the city downtown from Thirty-ninth street on express trains we can save 15 minutes in our running time and give the people living north of Thirty-ninth street better accommodations. It is our purpose to take the cars from the surface lines at Thirty-ninth street, shut the gates and shoot them downtown on this elevated line. Passengers who do not want to go all the way downtown can be transferred to the cars that run on the surface lines north of Thirty-ninth street."

MODERN LIGHTS IN ANCIENT FITTINGS.—DECORATIONS FOR THE DINNER OF THE FELLOWSHIP CLUB.

For more than a year Mr. Bowen has been studying the conditions and methods of other cities, and his engineers have reported upon several schemes. The tunnel plan in London, the Boston subway and like schemes were all declared impracticable in Chicago because of peculiar local conditions which it is asserted would make the cost prohibitive. With a light overhead structure upon which street cars could be operated at a high rate of speed, it was thought, the problem could be easily solved. Mr. Bowen believes that the South Side corporation would be able to take care of the traffic of the territory it occupies for many years without any difficulty.

One great advantage of the proposed plan is the high rate of speed that can be maintained throughout the South Side system. South of Thirty-ninth street, at present, a much higher rate is maintained on the surface lines than north of that point; in the business district, especially during the winter months, the cable cars creep along after coal wagons, moving vans, etc., although there is a city ordinance against delaying a street car.

Mr. Bowen's investigations have convinced him that the increased traffic on all lines of the Chicago City Railway company's system that would follow this improvement would repay the expenditure required.

Niagara Power in Buffalo.

The Buffalo General Electric company is making preparations for using Niagara power in the operation of its station to light that city. It is the present plan to abandon the Court street station and build a new station elsewhere, in all probability, or it may be erected on the Court street site. The apparatus necessary for making the change of plants has all been ordered from the General Electric company of Schenectady. As the current from the Falls is transmitted at a voltage of about 11,000, the first necessity will be transformers to reduce this voltage, and these machines, 11 in number, have been ordered. They will have a combined capacity of over 2,700 kilowatts, or about 4,000 horse power, and will transform the Falls current into a current of heavy amperage but of only 352 volts. These transformers will mark the end of the Cataract Power and Conduit company's line and the beginning of the new plant. As a matter of safety, they will be fed by two independent cables so that the light and power service will not be interrupted in case of a breakdown of either transmission system. Each cable will be capable of carrying the entire power of the station. The 352-volt current will be brought from the lower side of the static transformers into the station on copper bus-bars an inch thick and about six inches wide, and from these bars the distribution will be made to the various machines.

The uses of power supplied by the Buffalo General Electric company's station are practically three—high-tension direct currents for street lighting, which includes all outdoor arc lights used at night; low-tension direct current for small mercantile and domestic powers, such as elevators, press motors, laundry plants, etc., and high-tension alternating currents for inside arc lighting and various uses. The street-lighting equipment of the station will consist of 12 250-light units arranged according to a system that recommends itself as efficient and economical. Current from the bus-bars will be used to drive 200 horse power motors which will stand between each pair of 125-light machines. The ends of the motor armature shaft will be connected to the armature shafts of the two generators, and the direct current from the unit will supply 250 arc lamps of 10 amperes each.

The low-tension current for small power equipment will be obtained from two rotary transformers of 300 horse power each. These transformers will be practically of the same type as are now in use in the Buffalo Street Railway company's plant in connection with Niagara power. In reality they are compound machines, the current from the bus-bars actuating one side of the machine as a motor and the direct current of 550 amperes being generated by the other side of the machine.

In the matter of frequency changers the Buffalo General Electric company's plant will have machines that will be somewhat novel, as there are no other machines like them in the United States. It is understood that smaller machines are being built for use in Brooklyn, but the Buffalo machines will be much larger and more unique. The current that comes

from the Falls is one of low frequency of alternation, it being 25 cycles per minute. As this is too slow, the frequency changer is introduced to increase the rapidity of cycle, with a result that a current of 62.5 cycles to the second and a voltage of 2,200 will be obtained. In the frequency changers there will be 12 poles and an armature revolution of 375.

As yet the Cataract Power and Conduit company of Buffalo has found it quite impossible to decide on a general schedule of rates for Niagara power, as it is found that, so far, at least, it is quite desirable to figure on each application by itself.

A Home-made Alternator.

By B. F. Fells.

To make a 12-inch ring alternating-current dynamo, begin with the ring (see Fig. 1), the dimensions of which should be: Inside diameter, 12 inches; thickness of rim, one-half inch; width of rim, 2¼ inches. A piece of flat iron can be purchased, cut the right length, hammered into a circle on a mandrel and the butts welded. Then turn the ring

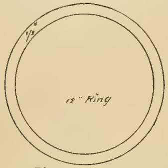


Fig. 1: Ring

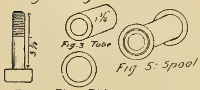

Fig. 2: Bolt   Fig. 4: Disk

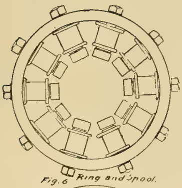

Fig. 6 Ring and Spool.

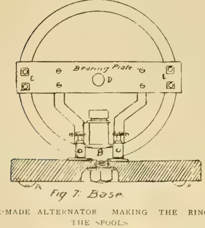

Fig 7: Base.

A HOME-MADE ALTERNATOR MAKING THE RING AND THE SPOOLS

true on a lathe. Next buy 10 bolts 3⅜ inches from inside of head to tip and seven-eighths inch diameter, as in Fig. 2. Now secure enough brass tubing to make 10 sleeves to fit over the 10 bolts, for forming the magnetic spools. The outside diameter of the brass tubing should be 1¼ inches and the inside seven-eighths inch. Cut the tube into pieces 1¾ inches long, and we have the sleeve as in Fig. 3. These sleeves must be provided with flanges. The latter can be made from sheet brass, about one-eighth inch thick, 2¼ inches diameter and bored with a hole to correspond with the sleeve over which the disk is to fit. Fig. 4 shows a disk. In soldering the disks to the sleeve, about one sixteenth of an inch space should be left on the sleeve, outside, as in Fig. 5 which [illegible] for wire connection, as will be seen further on.

The spools may now be [illegible] on the 10 bolts and the winding [illegible] In chucking a spool in the lathe [illegible] metal purposes about 110 feet of No. 22 double cotton covered magnet wire, wound in 10 layers (about 275 turns), will answer. The end of the wire on each spool is passed through a small hole previously cut in the disk nearest the center of the ring when in position.

Then apply four coats of shellac to the spools, allowing each coat to dry before putting on the next.

The spools are now ready to be placed in the ring. First divide the ring into 10 parts, and drill the holes for the spool shafts as in Fig. 6. The nuts may be placed on the shafts, or bolts, and the whole made firm. Care must be taken to so adjust the spools that the wire connections will produce north and south poles, which is accomplished by reversing the order of the wiring. This causes the current to take opposite directions around alternating spools. The ends of the wires are best united by little set-screw couplings which are sold at any electrical supply store.

Now the ring must be furnished with a wooden platform and set up, as in Fig. 7. The feet (A A) are brass screw-heads. A longer bolt can be substituted for the regular ring bolt at B and put through the platform as shown, thus securing the ring to the base very firmly. Bearing cross-pieces, one for each side, must now be made from brass one-fourth inch thick and 2½ inches wide. An inch hole is bored precisely in the center of each at D, and two three-eighth inch holes put in at E E for the supporting bolts. Corresponding holes are drilled in the ring. Binding posts (H H) can be purchased ready-made and fixed at the base as shown, where connection is effected with the two free ends of the field winding.

The armature is made by cutting very thin pieces of iron according to a pattern. Fig. 8 is an armature pattern intended for the pattern of the dynamo in process of construction. After making one pattern from tin, the other pieces can be marked off and cut with tinners' shears. Iron sheets of about 55 to the inch are the best. The armature is built up with thin paper (tissue) between each iron piece, shellac being used as the gumming agency. Fig. 9 shows a section of the armature core, seven-eighths inch thick. This hole is cut one inch diameter, and brass flanges of proper size are clamped by means of screws to either side, thus holding the same firm, as in Fig. 10. This figure also shows the process of winding on No. 20 double cotton-wound magnet wire.

The plan of winding is similar to that employed in the spools. The direction of winding is reversed for each tooth. About five layers of wire will be enough. Just before winding, put a coat of shellac on the armature core, and apply two or three thicknesses of silk fabric, winding over this.

We now have the ring and the armature core ready for the bearings. Fig. 11 shows the bearing plates affixed at B B. Four brass tubes, each 1¾ inches long, and of a diameter to conform to the bolts that are received by the plates, are now required. These tubes in position for one end of the dynamo are marked A A. Short shafts (C C) are also placed. These are hollow and are provided with small oil cups (E E) to lubricate the spindles that revolve within. The method of attaching the hollow shafts to the bearing plates is shown in section in Fig. 12, in which C marks the plate and D the shaft. It can be seen that the end in the plate is threaded, while a pin prevents the same from turning and loosening. In Fig. 13 we have a sectional view of the armature core and collecting rings in position. The armature core fits over a small brass hub B, as shown, and this hub is attached to the shaft C. The wood hub (D) is turned to 2¼ inches diameter at the smallest part, and three-fourths inch wide between the shoulders. The rings can be cut from seamless brass tubing.

Fig. 14 shows the bearing plate that goes on the side with the collector rings, brushes, etc. The brush-holders are made with ordinary binding posts and large-sized brass wire shaped at right angles where the end passes through the post. Copper ribbon can be used to effect the connection between the brush and binding posts. Fig. 15 shows the dynamo completed. The brass work can be polished, the wood base stained, and the iron work japanned. A small pulley can be set-screwed to the shaft and the machine operated.

Electrical Imports in Canada.

From the trade and navigation returns of the Dominion of Canada for the year ended June 30, 1897, recently issued, the following instructive figures are taken. They show the value of the imports of the goods named from the United States and from Great Britain and Ireland:

Class of Imports—	United States.	United Kingdom.
Electric motors, generators and apparatus.	$420,425	$ 5,688
Brass articles	267,492	35,125
Carriages and cars of all kinds	516,163	6,160
Copper articles	53,426	5,473
Engines and locomotives	158,860	4,024
Portable machines, etc	149,742	2,018
Steam pumps	24,128	694
Iron and steel rails	52,763	27,702
Boiler tubes	82,082	10,432
Covered wires	54,515	7,139

Commenting on the showing of the year, the Canadian correspondent of the Iron Age says: "It will be seen that the British column continues to shrink, while the American continues to swell. Of carriages, railway cars, etc., Canada's imports from the United States show an increase of $200,862 by comparison with the figures for the previous fiscal year * * * * * Of electric motors, generators and apparatus we have imported $233,314 worth more from the United States than in 1896. * * * * Most of these gains, excepting that in agricultural implements, have been made at the expense of British manufacturers, though in some cases, as in electrical machinery and goods, it is Canadian manufacturers whose business has been captured. The installment of several electric plants, notably the equipment of the Lachine Hydraulic and Land company's great works and of the equally great works of the Chambly Manufacturing company, brought into Canada a considerable amount of electrical machinery before the close of the fiscal year."

Electric Mail Van.

Between the General Postoffice and Paddington, in London, an electric mail van has been in daily operation for about a month. The daily distance traversed, in six trips, is 35 miles, and frequently the total weight of mails carried exceeds a ton. Forty secondary-battery cells, having a capacity of 172 ampere-hours at a discharge rate of 30 amperes, are employed. They are carried in a single tray under the bottom of the van and weigh about 1,300 pounds. A bipolar ironclad 3½ horse power motor is used having two armature windings, two commuta-

Fig. 9: Section Armature Core.

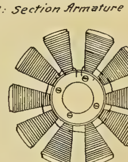

Fig. 10: Winding.

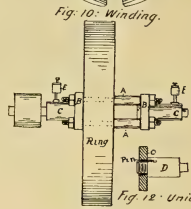

Fig. 12 · Union.

Fig. 11: Bearings.

A HOME-MADE ALTERNATOR.—BUILDING THE ARMATURE.

tors and two series field windings. A pinion on the armature shaft meshes into the central wheel of a differential gear. To provide for the different speeds of the driving wheels in turning curves the countershaft of the driving gear is made in two halves, each half being driven by the differential gear. Sprocket-wheels and chains transmit the power from the countershaft to the driving wheels. The driving wheels are 3½ feet in diameter and have solid rubber tires. The controller permits five combinations, which secures different speeds and tractive force: (1) All the windings on the motor, together with a resistance, in series; (2) the same, but with the resistance cut out; (3) the two field windings in parallel and the armature windings in series; (4) the fields in series and armature windings in parallel, and (5) the two field windings in parallel, connected in series with the two armature windings in parallel. The motor may be reversed at the slow speed by placing the regulator handle back of the neutral or top notch. The action of putting on the brakes also puts the motor out of circuit. The steering wheel is shown in front of the operator. It governs the movement of the vehicle by a connecting rod and a "fifth wheel," to which the forward wheels are attached, over the front axle. The maximum speed of the van is from 10 to 11 miles an hour, and the service is said to have been thus far satisfactory. The picture and data are from the London Electrician.

Present Efficiency of Incandescent Lamps.[1]

By John E. Randall.

The present efficiency of incandescent lamps for central stations lies somewhere between three watts per candle power and $3\frac{3}{4}$ watts per candle power. It might appear from these limits that no advance had been made in the lamp industry during the last 13 or more years of its extensive growth. As long ago as 1885 we heard of $2\frac{1}{2}$-watt lamps, and $3\frac{1}{2}$-watt lamps were considered a regular article of commerce. At the Detroit meeting of the National Electric Light association in 1887, a $1\frac{1}{2}$-watt lamp was described. As no one in the business is advocating longer life than was claimed 10 years ago, it would appear from these figures that the manufacture of incandescent lamps had retrograded, and was approaching the state of a lost art, and if the falsity of this supposition were not demonstrated every night one might be pardoned for thinking that the industry was disintegrating.

Every investigation of claims for extremely high efficiency has shown that there was some hocus-pocus; either the candle was of the wax-taper variety, or the watt was not one of the family that James

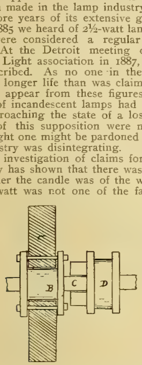

Fig. 13: Collector Ring Hub

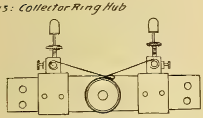

Fig. 14. Bearings

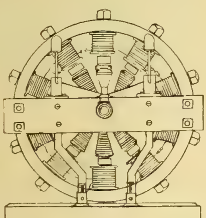

Fig. 15: Complete

A HOME-MADE ALTERNATOR —THE DYNAMO COMPLETED.

made famous, or else the lamps didn't live to tell the tale.

Finally people forgot about the one-watt and the two-watt lamp, and concluded to take what they could get, which might be anything from three watts to five watts, depending upon what the maker had ready to send. It really was a matter of small moment whether the lamps were three or five watts per candle, since they all went to five watts the day after they were placed in circuit.

This state of affairs has continued with some improvement until a comparatively recent date. In the meantime elaborate series of life tests were made under the auspices of the Franklin Institute. W. H. Pierce made an extended test, several foreign tests appeared, and tests were made at the Ohio State University of samples from 13 different makers. There was nothing promising in the general results of all these tests, and for a time the outlook was rather gloomy. Progress was being made, however, although the results were not published. It was found that lamps whose initial efficiency was less than three watts per candle power would not last a reasonable time on commercial circuits. This set the maximum limit of efficiency. The minimum was set by what the people would accept, and it was placed at four watts. More recently all energies have been exerted to produce types suitable for the various kinds of uses. We have now the highly efficient central-station lamp, the isolated-plant lamp and the railway type, besides numberless modifications for special uses.

Among the lamps in the Franklin Institute tests was one Weston tamadine 16 that maintained its brilliancy and gave most excellent life. It was the only one of the type, and almost the only one in the test that gave any indication of good quality, as quality is gauged at present. So far as that test went the tamadine lamps were a commercial failure, yet this one lamp showed what might be gotten from a cellulose filament. Since then the cellulose filament has been brought to a degree of perfection far surpassing the prototype. While made by a process differing from Mr. Weston's, the present filaments possess all the good features to be found in his early lamp and have outgrown most of the poor ones. Upon the quality of this cellulose filament I base a claim that the present efficiency of incandescent lamps is better than it ever has been, and is so much better that the lighting industry is to be congratulated.

The incandescent lamp is still a filament of carbon of high resistance hermetically sealed into an exhausted glass globe, with conducting wires passing through the glass. Its quality as an illuminant depends directly upon the quality of the filament and the quality of the vacuum.

The object of the vacuum is three-fold:

(1) To reduce the energy expended per unit of light emitted, because of the heat lost through convection.

(2) To prevent injury to, and destruction of, the carbon by burning.

(3) To prevent injury by abrasion or so-called "air washing."

Any gaseous envelope will carry away the heat-energy from an incandescing body so rapidly that a great amount of power must be supplied to maintain its surface at a temperature corresponding to a certain brilliancy, the core being at a far higher temperature. This loss becomes less, as the pressure of the surrounding gas is decreased, until a point is reached beyond which no further changes can be detected. When the vacuum reaches 1 part in 1,000, the loss becomes extremely small and, after a vacuum of 1 part in 10,000 is reached, the loss is negligible, so far as our present methods of measuring light can determine.

Some years ago we made a series of measurements showing the relation between the degree of vacuum and the power necessary to produce a definite candle power from a lamp filament. The net results showed that, so far as the convection losses are concerned, the degree of exhaustion ordinarily found in incandescent lamps is better than need be.

Carbon at high temperature cannot resist the attacks of oxygen. Therefore all oxygen must be eliminated, even slight traces causing injury to the carbon surface.

We would naturally suppose that the residual gas was composed of oxygen and nitrogen, in the proportions found in air. The induction coil shows that such is not the case, and I believe that in a properly exhausted lamp, although no other gas may be purposely admitted to displace it, no oxygen remains. It is known that a filament will rapidly decline in brilliancy if the vacuum is low, because the radiating surface is injured, but it will not burn out. Very few lamps burn out because of poor vacuum, unless cracked, when, of course, fresh oxygen is constantly admitted.

While the effects of abrasion formerly were considered of importance, my experience indicates that, at present, at least, they are of small consequence. A high degree of exhaustion, as measured by a vacuum gauge, is not the object to be attained; an unchanging vacuum is essential to the maintenance of the highest brilliancy. In the type of lamp made five years ago a positive injury resulted if the vacuum were made too high. The disintegration of the filament, due to evaporation of carbon, not only injured its surface but seriously darkened the bulb.

The vacuum does not grow poorer with age, provided the lamp is properly made and exhausted in the first place. The vacuum changes as the lamp is burned, and a part of the lampmaker's art is to reduce these changes to the smallest degree. But the vacuum is finally higher than at the start. Nothing is tighter than the glass and wire joints of a properly made incandescent lamp. Absolutely no leak can be detected after years. In some lamps used for at least 12 years in rheostats where the current at times brought them to full brilliancy, the vacuum was as good as when first made.

Many think that all lamps gradually lose their vacuum. This mistaken notion was caused, no doubt, by a fault common to many individual lamps having the old form of seal at the base, and illustrates the influence which apparently unimportant details exert upon quality, as well as the necessity for wide information and extended experience in successfully making lamps.

The present lamps, made by modern methods, have perfect joints, or else the leaks are so bad as to be instantly discovered by proper inspection.

The filament is the most important element of the lamp so far as efficiency is concerned. Filaments are now made from a form of cellulose, reduced chemically to an amorphous state.

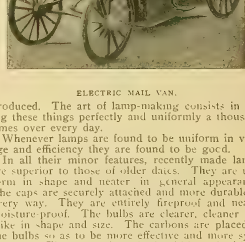
Not many years ago, when the bamboo carbon was supreme, we had occasion to complain about the poor quality of a certain lot of bamboo strips which we had received from an importing firm. They said that they could not guarantee a natural product. This furnished the key to the success of the cellulose filament. Art replaces nature, breaking down the structures of a fiber, reducing it to a protoplasmic condition and then spinning a thread radically different in appearance and character from the original material. Instead of whittling down a stock to make a lamp filament, we now cause the filament to grow.

The quality of the filament is determined by the thread. The process of squirting threads is controllable if proper skill, experience and appliances are employed. Yet the weather is more controllable than is the quality of the product, when any of these requisites is lacking. It is easier to shave down strips of bamboo to a uniform size, or to weave braids of silk fibers that will appear to be even, than it is to squirt a cellulose thread of uniform diameter, but the bamboo strips and the silk braid will not be uniform in weight. They cannot, therefore, make uniform carbons.

It may be supposed that the coating of carbon applied in treating the filaments fills up the pores and depressions, thereby correcting the defects due to irregularities in texture and surface. This is not true. A poor base-carbon cannot make a good lamp. When one filament is found to be better than another, its superiority can be attributed to the base-carbon.

In purity, density, surface polish and uniformity—the features that determine quality and maintain efficiency—the cellulose filament, properly made, far excels any other kind.

A graphitic coating covering an amorphous carbon body, in a vacuum, is, so far as known, the best combination for fulfilling these conditions. The science of lamp-making consists in knowing how the carbon body can be formed, how the graphitic coating can be given and how the vacuum can be



ELECTRIC MAIL VAN.

produced. The art of lamp-making consists in doing these things perfectly and uniformly a thousand times over every day.

Whenever lamps are found to be uniform in voltage and efficiency they are found to be good.

In all their minor features, recently made lamps are superior to those of older dates. They are uniform in shape and neater in general appearance. The caps are securely attached and more durable in every way. They are entirely fireproof and nearly moisture-proof. The bulbs are clearer, cleaner and alike in shape and size. The carbons are placed in the bulbs so as to be more effective and more symmetrical. The connections, both within and without the bulbs, are more secure. Cracks and poor vacuums have about disappeared.

These features help the service that can be derived from the lamps. They form part of the general economy of operation, and, therefore, influence the efficiency to the extent of being more satisfactory and reliable.

Another point worthy of consideration is the evolution of types suitable for the different conditions of service; one for close regulated central stations, one for poorer regulation and isolated plants in general, one for street railways and other purposes in which, for certain reasons, the service is severe. Added to these are the almost innumerable varieties for special uses, such as window decorations and signs. Finally, the use of cellulose has made the 220-volt lamp a commercial possibility.

It may be claimed that the new lamps are more delicate than the older bamboo, in that they cannot be run as long before the filament will break.

The principle upon which all practical methods of illumination is founded, that of incandescence excessive activity—limits the period of effective service and induces early destruction. We may as well accept the condition of limited life, in the case of the incandescent lamp knowing that no other light is better in this respect, if all factors are considered.

I am not willing to admit that the cellulose filament is more delicate, either in transit or in service. Under identical conditions, it will live longer than

1 Read before the Northwestern Electrical association, Milwaukee, Wis., January 20, 1898.

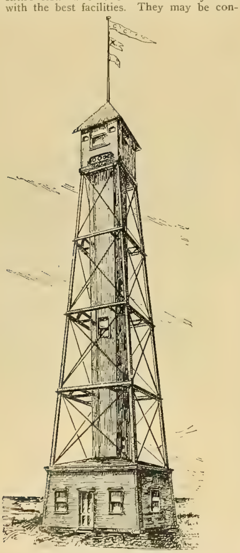
any other form of filament. Furthermore, the individual life approaches nearer the average than has been the case with any other material. Any carbon filament which will not maintain its brilliancy should live to a good old age.

The life of cellulose lamps at three watts per candle power should not be compared with bamboo or silk at four. The four-watt cellulose railway lamp is giving more satisfactory service than those of other materials. Its light is more uniform and they last longer.

Recent lamps are approaching the ideal one which, when its work is done, breaks and thus announces its own "smashing point."

The best proofs of any claim are those based upon actual performance. In support of the claim that the present efficiency of incandescent lamps is more satisfactory than the past, I submit some comparisons.

In the subjoined table are results of tests made upon three classes of lamps: First, the 110-volt cellulose; second, the 110-volt untreated bamboo; third, the 50-volt treated bamboo. The initial watts per candle power were nearly 3.2 for all. The bamboo filaments represent their class, both the 110-volt and the 50-volt having been carefully selected. The tests upon these were a part of a series upon a large number started in groups of various initial watts per candle, and the results are consistent with those of the entire test. The tests were carefully conducted with the best facilities. They may be con-



CABLE LAYING ON LONG ISLAND SHORE.—POSTAL TELEGRAPH-CABLE COMPANY'S MARINE OBSERVATORY AT FIRE ISLAND.

sidered reliable. Both lamps were at one time extensively used and well regarded. The figures shown for the cellulose lamps are the combined results of a number of tests made at various times and places and by different persons, but evidently under similar conditions, so far as regulation is concerned. There is excellent agreement, not only

LAMP TESTS.

Average candle power and watts per candle power of bamboo and cellulose lamps during various lengths of burning.

During a run of ...		0 Hrs.	100 Hrs.	200 Hrs.	300 Hrs.	400 Hrs.	500 Hrs.	600 Hrs.	700 Hrs.

	Bamboo, volts 110...	16.	[illegible]	[illegible]	[illegible]	[illegible]	10.4	9.9	9.6
	Bamboo, volts 50...	16	[illegible]	[illegible]	[illegible]	[illegible]	14.2	[illegible]	[illegible]
Av. watts per c. p.	Cellulose, volts 110...	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	3.51	3.71
	Bamboo, volts 110...	[illegible]	[illegible]	[illegible]	4.08	[illegible]	[illegible]	[illegible]	4.90
	Bamboo, volts 50...	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]

in averages but in individual cases, both in candle power and in watts per candle power. The oldest tests, which were made over three years ago, show the poorest results. This fact suggests a gradual improvement in the quality of the cellulose lamp. All the lamps entering the tests were samples of commercial lamps taken at random from large lots. No claim is made that the results are remarkable

I believe that they can be relied upon to represent faithfully the present efficiency of the incandescent lamps supplied for central-station use.

The remarkable feature is the close agreement between various lots made at widely different times. This feature is the criterion of quality. Upon it depends the successful introduction and use of the highly efficient lamp. I believe that they can be relied upon to represent faithfully the present efficiency of the incandescent lamps supplied for central-station use, because every result was used in the table, whether good, poor or indifferent.

This table shows the mean candle power during a certain period of service, and not the value found at the end of the period. For example, if a cellulose lamp, whose candle power is 16 at the start

CABLE LAYING ON LONG ISLAND SHORE.—WINDING CABLE ON REEL FOR SHIPMENT.

and whose economy is 3.2 watts per candle power, is in service for 500 hours, it will average 15.17 candle power during that period, but will give less than that value at the end. If a 50-volt bamboo lamp, of the same brilliancy and economy, is used for the same length of time, its candle power will average 14.2. The 110-volt bamboo will, under the same conditions, average only 10.4 candle power. In the latter case, especially, the great change in the brilliancy of the lamps after they had been running for a short time would be very noticeable.

Viewed in another way, if a station furnishes a service of 50 cellulose lamps to one customer, and to his neighbor a similar number of 110-volt bamboo, charging the same for each service, the one would be justified in demanding that his lamps be renewed every 100 hours, in order to keep his place as bright as his neighbor's.

A 50-volt bamboo lamp, to maintain the same average brilliancy as the 3.2-watts cellulose during any period from 300 to 700 hours' service, should have an initial efficiency of 3.4 watts per candle power. A four-watt 110-volt bamboo would not maintain its brilliancy as well as a 3.2-watt cellulose.

While none of the lamps involved in the tests failed before 600 hours, no other conclusion has been drawn from this fact than that the percentage of early failures of lamps, operated under good condition, is so small as to be neglected.

Lamps to-day are more uniform in wattage; a variation in current of two per cent., either way from the average, is rare. Candle power is tested while the lamp is revolving. Thus, the true horizontal value is determined. The value of light standards is carefully guarded and constantly checked. The accuracy of all instruments employed in the photometer room is kept at the highest degree. While an official standard of candle power does not exist this fact has not caused the great divergence in the light value of different lamps. The most prominent manufacturers are in agreement as to the value of the 16 candle power lamp. Their standards check more closely than do those of the technical schools.

lamp for the low-economy silk and bamboo and by improving its regulation, been able not only to reduce the price of service to its customers, but to increase its lamp capacity over 25 per cent.

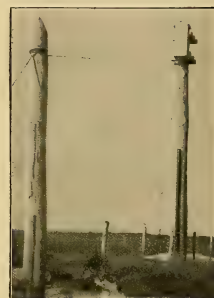
There is still one condition to be fulfilled in order that incandescent lighting may be more profitable—the voltage at the lamps must be kept steady at all times. There has been improvement, but much more is possible and desirable. Everything about lighting service is improved where regulation is improved, even the customer's temper.

Remedial Patent Legislation.

[From a Washington correspondent of the Western Electrician.]

The House committee on patents has acted favorably on the bill amending the patent law of March 3, 1897, so as to limit the restrictions against patenting an article on which a foreign patent had already been issued or previously described in a foreign publication. The bill provides that the restriction shall not apply to applications made within 60 days from the passage of the proposed amendment.

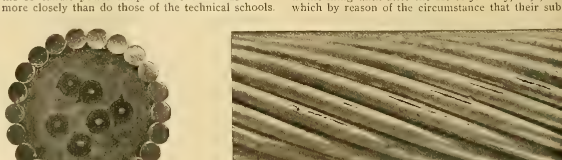
By an act of Congress approved March 3, 1897, the law relating to patents was amended so as to provide that no patent shall be granted in this country for an invention previously patented in a foreign country on an application filed more than seven months prior to the filing of the application in this country. By the terms of this act it went into effect on January 1, 1898, and all applications not reaching the Patent Office before that date were debarred from the benefits of the law. It has been found upon investigation that this radical change in the law, that existed for almost a century, has worked much wrong and hardship to American inventors generally, and in many cases has injured citizens of



CABLE LAYING ON LONG ISLAND SHORE.—CABLE TERMINAL POLE AT CONKLIN'S POINT.

other countries who extend to us reciprocal favors of like character.

The effect of the enactment of this bill will be to extend the already manifest intention of Congress to afford to a peculiarly situated class of inventors an opportunity to come in within a certain time and, as heretofore, avail themselves of a previously continuously existing law, and thus incidentally also to legalize those applications for patents which by reason of unavoidable accident, mistake, ignorance, lack of opportunity, or the like, have been delayed in the filing until after the 1st of January, 1898, and which by reason of the circumstance that their sub-



CABLE LAYING ON LONG ISLAND SHORE.—END AND SIDE VIEW OF CABLE.

Lamps vary in candle power because of carelessness and sometimes deception in rating. In the Columbia factory the accuracy of rating is considered a matter of prime importance, and constant effort is made to keep the standards exact. Each lamp has a mark whereby its history may be known. The volts at which it gives its normal revolving horizontal candle power, together with the current passing, are marked upon a suitable label. A record of these items for each lamp is made at the same time upon a sheet. These sheets are the indices of uniformity in the product.

One of the largest alternating stations in the country has, by substituting the highly efficient cellulose

ject-matter had been previously patented abroad for more than seven months are, by the radical changes wrought in the uniformly existing previous law by the act of March 3, 1897, now either void or destined to become burdensome upon the Patent Office and to those concerned.

In the case of all that large class of subjects of invention and patent which consists of new articles of trade, upon the introduction and manufacture of which new industries are built up, great delay in, if not complete prohibition of, introduction of their manufacture here will result through inability to protect it by patents in this country. It is only reasonable that those who thus take the

risks of introducing what is at first sight uncertain of success, but finally develops into a great industry and beneficial to our country, should have some guaranty of being able to indemnify themselves after having pointed out the successful way to others. The alternative would be to abandon the entire manufacture of the new article during the tentative period to foreigners, who would thus acquire such a start and such an advantage as to substantially preclude competition here for many years.

In view of the importance as well as fairness of the proposed measure, and the many reasons that can be urged in favor of its speedy enactment, there is every reason to believe that it will soon be on the statute books.

A. F. T.

CABLE LAYING ON LONG ISLAND SHORE.—TRANSFERING CABLE FROM REELS TO DECK ON WRECKING SCOW.

Cable Laying on Long Island Shore.

One of the most difficult pieces of submarine cable laying undertaken in recent years was successfully performed by the Okonite company, limited, for the Postal Telegraph-cable company on January 25th. The cable was the heaviest of the kind ever manufactured and laid and reposes in Great South Bay on the ocean side of Long Island, between Fire Island and Conklin's Point, six miles away on the Long Island shore.

Every yachtsman and many others know the dangerous character of the Great South Bay, owing to its constantly shifting shoals and sandbars. Only a native "bayman," and one of many years' experience, is a competent pilot through the devious and dangerous channels of the bay. The difficulties and responsibilities of the undertaking were such that the Postal company insisted upon the manufacturers of the cable laying it themselves. This the Okonite company did so successfully that it reflects great credit on the careful planning and preparations necessarily made in advance.

This six-mile cable forms the most important link in the line just completed by the Postal company for its ship-news service. The company has recently established several marine observatories outside the port of New York for the purpose of reporting at the earliest possible moment the arrival of steamships. The most exposed and the most distantly located of these observation towers is that just completed at Fire Island. From this observatory, which is on the ocean side of Fire Island, a substantially constructed overhead land line runs to the bay side of the island, where it meets one end of the submarine cable. The cable crosses the bay, as mentioned above, landing at Conklin's Point. Here it connects on a terminal pole with another land line which runs due north to the Long Island railroad tracks. This land line is a splendid example of modern telegraph construction, and is provided with two copper wires weighing 210 pounds to the mile. From the point where the land line meets the Long Island railroad tracks, it follows an old overhead line along the railroad, then along the highways until the outskirts of Brooklyn are reached, where it goes underground to No. 4 Court street, Brooklyn, one of the Postal company's offices. From that point the line runs in an aerial cable carried on the elevated railway structure to the Brooklyn bridge, thence over the Brooklyn bridge in another aerial cable to the New York terminus, whence it goes underground to the Postal company's main office at 253 Broadway, New York. In its course this important line passes through several townships on Long Island and three of the boroughs of Greater New York.

In order to fully understand the amount of preliminary work and planning required for the successful carrying out of this project, it will probably be as well to follow the cable on its journey from the Okonite company's manufacturing plant at Passaic, N. J., to its final resting place in the waters of the Great South Bay. The cable, as mentioned, is six miles long, was made in one length, and weighs about 65 tons. It is one inch and three quarters in diameter, contains six Okonite wires arranged as three pairs, and is heavily armored with galvanized iron wire. The cable weighs four pounds to the foot, which is about 5½ times the weight of an ordinary ocean cable. At the Okonite company's factory there is one of the largest testing tanks in the United States. The cable as manufactured was coiled in this tank and put through the usual severe tests. After satisfactorily passing through these tests, the end of the cable was led through a window to a heavy reel erected on bearings on a flat-car alongside the factory buildings. A leather belt was passed around one end of the reel and carried through the window to a shaft in the factory. By this means the reel was turned and the cable was wound upon it. It required three of these reels and three flat-cars to transport the cable.

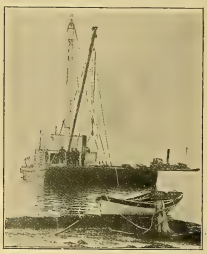
From Passaic the reel-laden cars were transported by as direct railroad connection as possible to New London, Conn., where they were run out on a pier and the cable was unwound and coiled on the deck of a large wrecking scow. The cable lay on the deck of the scow very much as it did in the testing tank at the factory.

CABLE LAYING ON LONG ISLAND SHORE.—GUIDING CABLE WHILE PAYING OUT FROM THE SCOW.

The reason for such a roundabout road was that New London was the nearest point at which a scow of the requisite size and of sufficiently light draft could be obtained. This was made necessary owing to the shoals and sandbars in the Great South Bay over which a heavy draft scow could not pass. Captain T. A. Scott, the famous New London wrecker, was in charge of this part of the work, and the skill he displayed in handling the heavy mass of material was truly wonderful to one unaccustomed to such work. The scow was 85 feet long, 35 feet broad, and drew about three feet of water with the 65 tons of cable on its deck. The cable was passed from the reels on the cars through a heavy snatch-block suspended from a derrick on the scow, and was coiled on the deck without a kink in six layers, containing about a mile each. This is the first time it is believed, that a cable of such length and size has been laid in such a manner. Heretofore heavy reels have been used with various degrees of satisfaction. The manner in which the cable was paid off from the deck of the scow in laying left no doubt in the minds of the experts who were present as to the success of this method.

When the cable was coiled down and made fast, the scow was taken in tow by a heavy, sea-going tug and towed down the Sound to a point off the Staten Island shore, where the outfit was obliged to anchor owing to heavy weather. The following day and night the journey was completed from Rockaway Inlet to Fire Island. The scow was anchored near the terminal pole of the Fire Island land line and a heavy rope was carried ashore in a small boat, passed through a pulley made fast to the terminal pole, and carried back to the scow. The rope was attached to one end of the cable, the other end of the rope being passed around a steam winch. In a very few minutes after the winch had started, the end of the cable was ashore, where it was made fast. A light-draft tug drawing but four feet of water was then made fast to the scow and the tedious and dangerous journey across the Great South Bay was commenced. The word dangerous is used advisedly, because if the scow had gone ashore on any of the numerous sandbars the great weight it was carrying would have rendered it well nigh impossible to release it before the bay froze over, which was threatened at any minute.

The tug was piloted by an expert bayman, Capt. L. Candee and George T. Manson of the Okonite company.



CABLE LAYING ON LONG ISLAND SHORE.—LANDING SHORE END OF CABLE ON FIRE ISLAND.

George Saxton. Owing to his thorough knowledge of the channels and bars the cable was successfully laid in the wonderfully short time of four hours, without a single hitch or delay from any cause. The cable was paid out over the stern of the scow in much the same manner as it was carried aboard. A guiding block was rigged up on the stern of the scow through which the cable passed, and an extemporized brake was used to regulate the speed of paying out. The numerous illustrations accompanying this article will give a very clear idea of the numerous steps of the work.

Valuable assistance was rendered in the shipping and laying of the cable by R. D. Blish, the cable expert of the Southern New England Telephone company, and the laying of the cable was witnessed by E. B. Baker, general superintendent of the Southern New England Telephone company, who was greatly pleased with the methods and means used. E. G. Cochrane, general superintendent of construction for the eastern division of the Postal Telegraph-cable company, was present, as well as Capt. W.

CABLE LAYING ON LONG ISLAND SHORE.—PAYING OUT CABLE.

Dr. W. S. Hedley, writing in a recent issue of the Electrical Review of London, makes the rather sweeping statement that, "In the opinion of the present writer everything seems to point to the fact that all commercial forms of electric-lighting currents, varying as they do from 80 volts upwards, are dangerous to human life under certain conditions. Fortunately," he adds, "the required conditions do not often occur in actual practice, and when they do occur they admit of remedy."

Telephone men, especially those operating or supplying apparatus for the larger exchanges, should give careful attention to Judge Toulmin's decision upholding two claims of the Scribner multiple switchboard patent, as reported on another page. The contest was between the Western Electric company, the owner of the Scribner patent, and the Home Telephone company, and the latter was held to have infringed two, and only two, of the claims of the patent. As a matter of course, independent telephone men will make a careful study of the two claims which are upheld.

In this country the renting of electric motors is unusual; the machines are usually sold outright; but in England it is proposed to let them out by the year, and, what is of greater novelty, the proposition is made on behalf of a municipal corporation. The idea is to increase the day load of a municipal plant, and is credited to the electrical engineer of the city of Bradford. It is hoped that the small power users of that city, to whom the outlay for the purchase of motors and equipment might seem prohibitive, will be willing to rent small motors, and thus increase the demand for current. The motors for hire range from one-half to six horse power, the rent varying from $7.50 per annum for the smaller size to $25 for the larger. The annual payment includes the supplying and fixing of the motor and the necessary controlling apparatus, and also a fortnightly inspection by a member of the city electrical staff. The consumer has to provide all oil, brushes, etc., which must be obtained from the corporation stores. The wiring is also done by the consumer. The charge for current for motors is five cents for each kilowatt-hour, and a great expansion of this curious branch of the municipal business is anticipated. As there appears to be no central-station company in Bradford, although it is a city of over 200,000 inhabitants, no private industry suffers by the paternalism of the municipal corporation.

Among the several theories advanced to account for the terrible catastrophe in Havana harbor are two connected with the electrical equipment. One hypothesis is advanced by Captain-general Blanco of the Spanish army, who, in a telegram to the charge-d'affaires at the Spanish legation in Washington, says that the disaster is "believed to result from an explosion of the boiler of the dynamo." This can only refer to one of the main boilers of the steam plant of the ship, from which the steam for the dynamo engines was obtained. It is hardly conceivable that the boiler in use could have exploded. The Maine was a modern ship, launched less than eight years ago, and its mechanical equipment included all the automatic safety appliances known to steam users. Besides, the vessel was in port, and only a moderate pressure of steam could have been needed. Moreover, all descriptions of the destruction of the ship indicate that the explosion was forward of the boiler-room. The possibility of a boiler explosion is very slight, and the examination of the wreck will enable the point to be decided with certainty.

The suggestion that electric wires in the ammunition chamber caused the explosion is still less tenable, for the very good reason that the presence of electrical conductors in the powder magazines is sedulously avoided in the wiring of all men-of-war. The vault containing the explosives is lighted through a tightly glazed port-hole by carefully guarded incandescent lamps. There are no electrical lamps, fixtures or circuits of any kind in the magazines, and there is no possibility that a short-circuit could have caused the explosion.

The cause of the loss of the Maine with the lives of 250 seamen of the United States Navy seems to be veiled in obscurity. If it shall prove that the ship was blown up by enemies of this country, we rest assured that the reparation exacted will be commensurate with the awful enormity of the offense.

Telephone subscribers in all parts of the country who are depending upon Bell exchanges for service will be interested in the controversy at Washington over the right of operating companies to enforce restrictions of the use of the instruments for which a stipulated rental is paid. The court has declared that the company has a legal right to prohibit the use of subscribers' instruments by outsiders or for other purposes than the actual business of the individual, firm or corporation in whose establishment the telephone is placed. The court held that the telephone company could not be expected to furnish service to those who were not subscribers, and it was not fair to have the lines and instruments of the system used by outsiders, as this would impair the usefulness of the service to subscribers. Of course the only consideration that enters into the case, so far as the Bell interests are concerned, is the question of payment for service. That corporation is perfectly willing that the entire community shall be permitted to use its lines and instruments if compensation is forthcoming. For this reason the company advocates the placing of slot-machines in public places, such, for instance, as drug stores, hotels, etc., and it denies to those living in hotels the right to use the telephone for which a certain yearly rental is paid by the keeper of the hostelry. It was an attempt to enforce this rule that precipitated the controversy at Washington, which culminated in a legal decision practically upholding the local Bell company's claims.

While it is undoubtedly true that telephone privileges are often abused, it is equally certain that the corporations operating exchanges throughout the country will gain nothing by following such a narrow policy as that outlined by the Washington concern for the guidance of its patrons. The Bell company is so generally disliked, and with so much reason, that it is really a wonder that the management does not attempt to conciliate rather than antagonize the public.

Although the street-railway system of Glasgow is held up as a model for Americans, so far as management and advantages to the municipality are concerned, it is not so highly regarded nearer home. Robert P. Porter, in an interesting contribution on this subject, says that the system of fares in vogue in that city could not be followed in an American town. "While some of our municipal-ownership advocates are eulogizing this system," he says, "the more advanced undertakings in England are adopting the American plan. Thus the elevated traction of Liverpool has adopted a uniform fare," and "the London Central Underground railway has also decided upon a uniform fare, according to class." Even the Glasgow district subway, a private enterprise opened since the city assumed control of the surface roads, has rejected the cumbersome system in vogue upon the city lines. A much more important feature of the Glasgow enterprise is the fact, as stated by Mr. Porter, that a wide-awake American street-car company could have leased the Glasgow tracks when the city took them over, installed a modern system, extended the track, and, with the Glasgow wages, just half those paid in this country, carried passengers as cheaply, if not more cheaply, than Glasgow is carrying them to-day. It could, furthermore, have assumed all the risk and paid the city more money per annum with profit for mileage and common good than the municipality will get by operating the cars itself. An American syndicate offered to install a mechanical system in Glasgow, and, if granted a reasonable lease, guarantee the common good fund a net income of £50,000 ($243,325) per annum, the city to assume no risks. Mr. Porter's conclusions, after a personal examination of the operation of the system and the reports of the officers in charge, is worth reproducing here: "Of course, Glasgow knows its own business best and it is only when we are told that if we would only do things as Glasgow does, we should do so much better than we do do, that I am tempted to answer that the Glasgow experiment is of no value to an city in the United States. The offer referred to may be open at the present time, and Glasgow may yet wisely accept it. However this may be, the actual results in Glasgow, when put to the American test, in no way indicate that the Glasgow experiment has either solved a problem in street-car enterprises, or is of the slightest value in pointing out a civic moral or adorning a municipal ownership tale." It seems to be the opinion of American street-railway and financial experts that the city of Glasgow would be much better off if it had made some arrangement for the operation of the system by a private company at a fair annual rental or division of the profits.

Telephone War in Washington.

[From the Washington correspondent of the Western Electrician.]

There has been a very brisk little gale in progress in this city during the last 10 days or so, regarding the use of telephones by subscribers and outsiders and also regarding the rate charged by the Chesapeake and Potomac Telephone company of this city. The matter was first brought to public notice by the institution of a suit against the telephone company by the proprietor of the Fredonia Hotel, who secured an injunction against the telephone company, restraining it from removing the telephone from his hotel. Mr. Danenhower, the complainant, explained his position as follows:

"In my warehouse I have had a telephone for 13 years. It has been in my hotel for eight years. On November 1st I received a letter from Mr. Bryan, of the company, calling attention to the use of the telephone. I paid no attention to it. The first of the year I failed to receive a bill from the company for the use of the telephone for that quarter, but on the 10th of January I sent a check. I pay $100 for the hotel telephone and $120 for the one in the warehouse. The same day I sent the check I received another letter from Mr. Bryan, stating that if the telephone was used as it had been the company would remove it from the hotel. On January 14th, after I had used the telephone four times, a guest of the hotel used it, and when he had finished, Mr. Bryan called me up personally and told me if I didn't cease the illegitimate use of the telephone it would have to be removed. We had some conversation which was ended when he said he would send a man over to confer with me in regard to the matter.

"This representative of the company visited me. He said I had no right to call up my own warehouse from the hotel outside of any business connected with the hotel. I was told that if I should telephone to find out whether my wife was sick or not, I would have to pay 10 cents. I was told further that I rented the warehouse telephone simply to sit in my office and receive all messages relating to business connected with the warehouse, and could only send out messages relating to its business. The representative of the company said that the hotel instrument was strictly for hotel business only, and might be used by employes of the office. I was again told that if I telephoned home to find out whether any of my family were sick, I should have to pay the specified amount for outside messages. It was stated that the best way out of the difficulty would be to put a slot machine in the office. For this I was told that I would be required to guarantee $10 per month. If the receipts did not come up to that I should have to pay the difference. Anything over that would be divided between the company and myself. I would get 25 per cent. and the company 75. I refused to do this and the injunction was issued."

Justice Cox based his decision upon the fact that "the telephone company is obliged to maintain a special plant, and is entitled to charge for every message sent." He said further: "All that the law requires is that the company shall not discriminate between its patrons, but must serve all persons on the same terms. The explicit terms of the contract, made between the parties in 1896, are that the telephone be for the subscriber's use only, and on a breach of the terms the contract may be violated.

"When the subscriber allows others to use his telephone it is an abuse of the time of the telephone operator. It is also an infringement on the rights of the Bell Telephone company, which receives a royalty from the defendant. Furthermore, it is an infringement of the rights of other subscribers. It is very annoying for a subscriber to call for a certain number and be told that the connection he wants is busy, that being due to the fact that a non-subscriber is using, free of charge, the telephone with which connection is desired.

"The hotel guest is entitled to the use of the telephone in the hotel, but no one is entitled to the use of the telegraph if the telegraph company has an instrument in the hotel. The guest does not have his telegrams sent free of charge, nor does he secure the service of messengers and the use of carriages without pay. Why should he be allowed to use the telephone without paying for its use?"

The following amendment to the District Appropriation bill has been adopted: "Provided, That from and after the passage of this act it shall be unlawful for any person or any telephone company doing business in the District of Columbia to charge or receive more than $50 per annum for the use of a telephone on a separate wire, $40 for each telephone, there being not more than two on a wire, $30 for each telephone, there being not more than three on a wire, and $25 for each telephone, there being four or more on the same wire."

This incident was the cause of a universal flurry among the citizens of Washington, subscribers and non-subscribers to the telephone company. The druggists especially have taken up the matter as being especially aggrieved. Last summer an order was issued by the telephone company requiring all druggists to put in slot machines, and if the proprietor of a drug store wished to use his own telephone, he had to pay 10 cents, the same as outsiders. If a drug store had the agency for a laundry every time a message was dispatched to the laundry, the drug store had to pay. The druggists are now talking of boycotting the telephone company, and they are upheld in this by a number of citizens. The Chesapeake and Potomac Telephone company is the only telephone company in this city, but a bill has been introduced in the House authorizing the Automatic Telephone Exchange company of Washington and London to lay wires and establish a telephone service, the rates not to exceed $5 a month. The bill also provides that the company shall "allow each subscriber an unlimited use of the telephone supplied."

Commenting upon this controversy William E. Curtis, the Washington correspondent of the Chicago Record, says:

There is a telephone war in Washington which has got into the courts and Congress, and will undoubtedly result in the passage of a law regulating the charges and the service on some more equitable basis than we have been accustomed to. The charges in Washington range from $80 to $120 a year, according to the distance of the subscriber from the central office and the number of messages sent. For $80 a year the subscriber has the right to send 600 messages within a circuit of a mile, and there is a sliding scale for longer distances and a larger service. All messages above the number given are charged extra at the rate of 7, 8, 9 and 10 cents each, according to distance, and when the subscriber signs a contract he stipulates that he will not permit the telephone to be used by any persons except the members of his own family or his employes. Having discovered that the guests of the Fredonia Hotel were using the telephone freely, the company served notice upon Mr. Dannenhower, the proprietor, that it would be removed for violation of contract unless they paid toll. Mr. Dannenhower went into court and got a temporary injunction restraining the company from interference. The case was argued last week, and Justice Cox of the District Supreme Court made the injunction permanent, but imposed the stipulation that Mr. Dannenhower should observe the terms of the contract with the telephone company, which forbid the use of the instruments by his guests.

"It may be used," said the court, "for the benefit and the accommodation of boarders, such as sending for a wagon or carriage, but it may not be used by them for social purposes nor for the calling of stock reports or ordering theater tickets or any business of that kind. The explicit terms of the contract made between the parties are that the telephone is furnished for the subscriber's use only, and for a breach of the terms the contract may be violated."

In other words, the contention of the telephone company was sustained. Hence several hotels have ordered the instruments removed. The House of Representatives inserted a provision in the bill which appropriates money for the government of the District of Columbia prohibiting the telephone company from charging more than one-half of the present rate. That bill is to be taken up by the Senate this week, and it is believed that the amendment will be concurred in.

According to the Washington Star, many of the subscribers to the service of the Chesapeake and Potomac Telephone company are up in arms against the company over its enforcement of its alleged right to prevent any but the subscriber from using a telephone. A movement is reported to be now on foot on the part of a number of subscribers, professional and business men (other than hotelkeepers), to pool their interests and make a test case of the refusal of the company, for instance, to permit anyone but a doctor, or some one connected with his office, using his telephone.

Recently a Washington man leased desk room in his office to two friends. The lessor had a telephone in his office, for which he paid an annual rental of $130. When his tenants came in, the telephone company informed the subscriber that the tenants would not be allowed to use his telephone unless each paid $30 a year for the privilege, in addition to the $130 which he paid. The man told the president of the company that his tenants would use his telephone free of charge. The president replied that if they did the telephone would be taken away. The man dared the president to carry out his threat, and the telephone was not moved.

Washington subscribers declare that the telephone company is constantly making such threats and carries them out only when it thinks the offending subscriber is a person whom it can afford to antagonize. The statement is made that the result of such a policy is that Smith, who may be an important man or a man of some influence in Washington, permits his telephone to be used by anybody he pleases, while Jones, next door, who is not so important a personage, has to conform to the company's demands or lose his telephone.

Telephony in the South.

[Special correspondence of the Western Electrician.]

The Arkansas and Tennessee Telephone company is rebuilding its line between Memphis, Tenn., and Osceola, Ark., and will soon have it in good condition for business. The company has one wire over the Mississippi River at Richardsons, Tenn., and will soon add another. The span is 1,900 feet.

The Cumberland Telephone and Telegraph company has a large force of men building a line from Memphis to New Orleans. This company is now pushing the construction of both long-distance lines and exchanges in small towns in the South.

George W. Schenny of Memphis, who owns the Corinth and Greenwood, Miss., exchanges, will about the first of March put in at Greenwood a 200 switchboard in place of the 100-number board he now has in operation at that place. He is very much encouraged by the growth of business.

C. W. Bolton of Pontotoc, Miss., has lately acquired a franchise for a telephone system for that town and throughout the county. He now has a line in operation with five or six telephones on it.

One of the biggest deals in telephone property that has been made in the South was consummated a few days ago when the Cumberland Telephone and Telegraph company of Nashville, Tenn., secured control of the Southern Telephone and Telegraph company's lines, which extend through Mississippi and Louisiana. The Cumberland company's lines run through Southern Illinois and Indiana, Kentucky and Tennessee, so that the consolidation gives one company control of wires running from Illinois to the gulf. The capital of the Cumberland company is $1,700,000 and of the Southern $1,800,000. Exchanges will be put in the larger Mississippi and Louisiana towns and wires extended to Mobile. Under the terms of the deal one share of the Cumberland company's stock will be given for two of the Southern's stock. It is stated that new lines will be built to all important towns in the whole territory.

Telephone News from the Northwest.

[From the Minneapolis correspondent of the Western Electrician.]

The recently formed Eastern Wisconsin Telephone company of Elkhart Lake, Wis., is making an aggressive beginning. It has absorbed the Sheboygan and Manitowoc County Telephone company, operating between Elkhart and Manitowoc, and has made application for a franchise at Fond du Lac and at Chilton, Wis.

The Mankato Citizens' Telephone company will ask the council of Mankato, Minn., for a franchise.

A telephone exchange will be put in at Nevada, Ia.

Mount Pleasant, Ia., is looking forward to better telephone connections. It will have lines to Winfield and Mount Union, and will also be on the long-distance line and can connect with Chicago, New York and other eastern cities.

Harry Lashway, manager of the Wisconsin Telephone company's office at Menomonie, Wis., has resigned and will go to the Klondike.

The Northwestern Telephone Exchange company is securing a right-of-way between Fairmont and Sherburn, Minn.

The Cumberland Telephone company of Cumberland, Wis., will have its system in operation the first week in March.

The Farmers' Electric Telephone association has been formed at Harmony, Minn., and will build a line to Cresco, Ia.

The Union Electric Telephone company has reduced its rates in Fillmore County, Minn., one-half.

R. L. Kraus and K. W. Doege have been granted a franchise for a telephone exchange at Marshfield, Wis.

T. W. Stone is working to put in a local telephone system in Benson, Minn.

E. M. Webster and J. R. Serrin are organizing a telephone system at Glenwood, Minn., and propose to cover the county.

D. B. Porter of Clinton Center, Ia., proposes to build a telephone line to Warsaw, Sewell and Corydon, Ia.

The Western Electric Telephone company of Britt, Ia., has applied to the council of Sioux Falls, S. D., for a franchise for a local telephone exchange.

The Dakota Central Telephone company of Aberdeen, S. D., proposes to extend its system through Ipswich, Leola, Roscoe, Eureka, Mound City and Bowdle, S. D.

Telephone Fight in Chippewa, Wis.

In the contests between the old and new telephone companies, or, in other words, the Bell and independent interests, there are frequent tilts that bring out the best qualities of the men engaged as the excitement enlists their hearty support. There was recently a case of this kind in Chippewa, Wis., according to the local papers. The rivalry between the two telephone companies occasionally assumed an interesting aspect, and incidents have occurred since the new company commenced the construction of its system that have set the entire town talking. The Bell people have naturally opposed the newcomer, and, as is well known, every effort was made to exclude it before the council granted a franchise. On Stanley Hill the Wisconsin Telephone company raised its poles about 10 feet, ostensibly to escape contact with the trees, but according to officials of the new company to prevent the wires of the competing system from being strung in that vicinity. J. C. Crowley, who has charge of the construction for the new company, succeeded in outwitting the Bell men in another instance not long ago. Mr. Crowley ordered postholes dug on the opposite side of the street from that on which he contemplated stringing wires. The next day Bell poles occupied the side of the street where the new company had dug the holes a few hours previously, and then Mr. Crowley and his men proceeded to erect the new company's poles where he wanted them.

Scribner Multiple Telephone Switchboard Patent Sustained.

The decision of the court handed down on the 9th instant at Mobile, Ala., in the suit brought by the Western Electric company against the Home Telephone company for infringement of the Scribner multiple switchboard patent, No. 330,061, is of more than usual importance.

Two claims of the patent, the second and fourth, were found infringed, and as these claims make clear the nature of the invention, they are here quoted:

"2. At a telephone-exchange central office, the combination of multiple switchboards with telephone lines, each permanently connected to a metallic portion of its switch upon each board, each telephone line being also connected through the contact points of its switches and to ground, and means whereby the circuit of the branch wire of any given line is opened when a connection is made with the line at any board, whereby any two lines may be connected together upon either of the boards without including in their circuits the contact-points of either of their switches.

* * * * * * * * *

"4. The combination, with a telephone line provided at each switchboard of a multiple system with a connecting bolt or switch, of a portion of said line connected through an annunciator to ground, and means for breaking said line when a connection is made with the telephone line at either end of its bolts or switches, substantially as and for the purpose specified."

The defendant company, early in 1896, installed a multiple switchboard designed by Paul Minnis of Mobile. Suit was commenced in August, 1896, and proofs were taken during the winter and spring following at Chicago, Baltimore and Washington, Messrs Charles E. Scribner, the inventor, and T. D. Lockwood and Charles D. Haskins, the experts, being witnesses for the complainant. Messrs. Charles D. Minnis, Clayton B. Clark and William S. Paca, experts of Baltimore, testifying for defendants. The hearing, which was had last June, occupied three days, the arguments being made by George L. Roberts of Boston and George P. Barton of Chicago for the complainant, and, on the part of fendants, by Charles B. Tilden of Washington, D. C., and Henry Hanaw of Pillans, Torrey & Hanaw of Mobile.

The legal and electrical questions involved are discussed in an elaborate and carefully prepared opinion of some twenty pages, from which the following extracts are taken:

"United States Circuit Court,
Southern District of Alabama.

"Western Electric Company
vs.
Home Telephone Company, Albert S. Lyons and Adam Glass.

February 9, 1898.
In equity.
No. 202

"Toulmin, Judge.

"This is a suit in equity brought by the Western Electric company, on letters patent of the United States No. 330,061, dated November 10, 1885, as the assignee of Charles E. Scribner, to whom the patent was granted, against the Home Telephone company, Albert S. Lyons and [illegible] Glass.

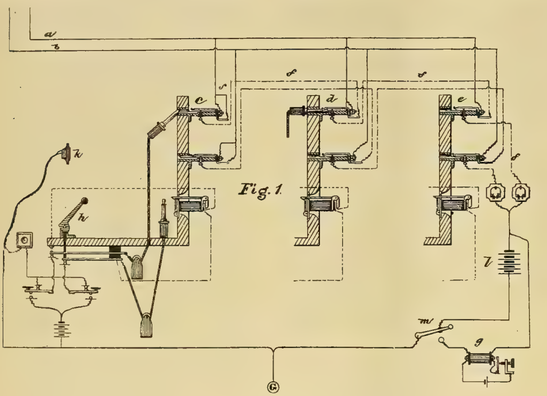
* * * * * * * * *

"Scribner, the patentee [illegible] for complainant, states the object of [illegible] and among other things says:

"'The patent in suit No. 330,061 is for a multiple switchboard. The result sought to be accomplished by the invention of the patent is the connection between any two subscribers' lines in a telephone exchange, the exclusion of contact points from the circuit of such connections, while at the same time, the indicator annunciators of such connected lines are temporarily cut off from their respective lines.'

* * * * * * * * * *

"The several or perhaps numerous contacts, the evidence shows, were liable to and often did maintain poor electrical union; often filled between their touching points, more or less, with dust or other foreign substance which impaired and even sometimes destroyed their contact, electrically speaking, and such several separable contact points of each line at each board, or board section, also constituted a series of breaks or breakable points in the talking circuit depended upon by users of telephones for the transmission of speech. The evidence in this case is strongly persuasive, if not wholly convincing, that the invention embodied in the patent involved herein overcame and eliminated these difficulties and produced a substantial and meritorious advance in this useful art. By means of this invention, as expressed in the patent, and as shown by the evidence, the series of separable contacts of each of any two lines to be brought together are cut out of the talking circuit when any two of the spring-jacks on a board, or board section, are electrically connected by a pair of plugs and their conducting cords; thus, referring to Fig. 1 of the patent [see accompanying illustration], if the upper plug is inserted into the spring-jack or switch c in the upper left-hand part of the figure, and then the lower plug is inserted into the spring-jack or switch on the same left-hand board, the subscriber's line a and the subscriber's line b will become electrically connected for talking purposes. At the same time each of the upper spring-jacks or switches d and e of the line a will be cut out of the circuit, and each of the spring-jacks or switches of the line b, lowest under d and e, will also be cut out."



SCRIBNER MULTIPLE TELEPHONE SWITCHBOARD PATENT.

After a consideration of the testimony of the witness Clark concerning some seven prior patents, the opinion proceeds:

"Whatever then be the merit or demerit, or the accuracy or inaccuracy of these statements and discussions, it remains that the patents mentioned do not, as they now exist, according to this witness, contain the invention covered by complainant's patent, but, on the contrary, that changes must be made in them before it is even pretended that they will show this invention.

"The Supreme Court, in Topliff vs. Topliff, 145 U. S., 156, p 161; has said:

"'It is not sufficient to constitute an anticipation that the device relied upon might, by modification, be made to accomplish the function performed by the patent in question, if it were not designed by its maker, nor adapted, nor actually used, for the performance of such functions.'

"The force of this ruling, and the similar ruling in Clough vs. Barker, 106 U. S., 175, is made manifest, in its practical application to the rights of parties, by the reflection that all earlier patents set up in defense against later patent sued upon, are but the record evidence of the status the art has reached. The rights under such later patent are subject to what this record evidence actually shows. To change this record, by permitting theoretical modifications of these earlier patents, would be the same in principle as to change, by interpolation or modification, any other evidence between the parties.

"The witness, Minnis, answer 24, discusses at great length the question of whether there is anything novel, and of a patentable character, in the patent in suit in view of patents Nos. 292,865, 292,866, 330,059, 330,060, 294,482 and 269,438. He does not say that he finds the invention of the patent in suit in either or all of these patents, but would make it appear that, by changing some or all of them, or by combining some of them together, thus resorting to the process of modifications and reorganizations, he would then arrive at this invention. For instance, he says: 'Thus it will be seen by means of these four patents we have been brought up step by step to an arrangement and combination almost identical with that shown in the patent in suit.' But this 'almost,' with its indefinite bounds, forms the missing link; and, it is thought, brings this form of attack on complainant's patent substantially within the rule pronounced in Topliff vs. Topliff, supra, and Clough vs. Barker, supra, and is also within the objections to such a course pointed out by Judge Coxe in the case of Johnson vs. Forty-second Street M. & St. N. Avenue R. company, 33 Fed., 500, where he says:

"'The defendant assembles every similar device, description or suggestion in the particular art not only, but also in analogous and even remote arts. Everything which has the least bearing upon the subject is brought in and arranged by a skillful expert in an order of evolution which resembles most clearly the invention which is the subject-matter of attack. Having thus reached a point where but a single step, perhaps, is necessary to success, and knowing from the inventor exactly what that step is, the expert is asked if the patent discloses invention, and, honestly no doubt, answers in the negative. There is always the danger, unless care is taken to divest the mind of the idea added to the art by the inventor, that the invention will be viewed and condemned in the light of ascertained facts. With his description for a guide, it is an easy task to trace the steps from the aggregation to the invention.'

"'In the law of patents it is the last step that wins,' says Justice Brown in Barb Wire Fence cases, 143 U. S., 275. * * * * If patent No. 321,390 covers broadly the identical invention covered by the patent in suit, as is claimed by defendants, why the substitution or change of bolts and contact switches, as suggested by witness Minnis? Why any change of construction in the arrangement shown in patent No. 321,390 if it possesses all the functions of the patent in suit?

"'The grant of letters patent is prima facie evidence that the patentee is the first inventor of the device described in the letters patent and of its novelty. The burden of overcoming the prima facie case made out by the production of the patent is upon the defendant, and the defense of want of novelty must be clearly established before a court will be justified in setting aside the patent on this ground. Not only is the burden of proof to make good this defense on the party setting it up, but it has been held that "every reasonable doubt should be resolved against him."' (Cantrell vs. Wallack, 117 U. S., 689; Palmer vs. Corning, 156 U. S., 342.)

* * * * * * * * * * *

"This patent was not 'the mere carrying forward of new or more extended application of the original thought' shown in patent No. 321,390, as claimed by defendants' counsel; nor was it 'a change only in form, proportion or degree, doing substantially the same thing in the same way by substantially the same means' as patent No. 321,390.

"It is true that it was a patent for new combinations of what were old elements when considered by themselves; but 'a new combination, if it produces new and useful results, is patentable though all the constituents of the combination were well known and in common use before the combination was made.' (Palmer vs. Corning, supra.)

"My opinion is that the patent in suit accomplished an absolutely new and useful result; that it was a pioneer invention."

After citing other authorities and comparing the claims in detail with an illustration of the defendants' switchboard, the opinion proceeds:

"From this comparison of the patent in suit with the model or diagram of the apparatus shown to be in use by the defendants, it seems clear to me that the defendant, Home Telephone company, has adopted substantially the invention alleged to be infringed.

"'In determining the question of infringement the court is not to judge about similarities or differences by the names of things, but is to look at the machines, or several devices or elements, in the light of what they do or what office or function they perform, and to find that one thing is substantially the same as another if it performs substantially the same function in substantially the same way, to obtain the same result.' (Cantrell vs. Wallack, supra.)

"There is no conflict in the testimony as to the fact that the invention covered by the patent in suit and the apparatus in use by defendants accomplish the same result; and there is no material conflict as to the construction and operation of the respective apparatus or devices shown by the patent and the admitted diagrams in the case; but there is a want of harmony in the conclusion of the witnesses on the conceded facts; there is a difference in their expert opinion on the question, whether the two machines or devices are substantially identical and employ substantially the same means to obtain the result, which it is conceded is the same. But the comparison made brings me to the conclusion, agree-

ably also to the weight of the evidence, that claims 2 and 4 are infringed."

No decree was made against the individual defendants, Lyons and Glass, the court holding that the evidence did not show that in their individual capacity they had violated any of complainant's rights, and the operation of the injunction was ordered suspended for 60 days after the entry of the decree on account of public inconvenience that might result in summarily enjoining the Home Telephone company in the use of its switchboards.

The language of the decree, as certified by the clerk of the court, is as follows:

"This cause, coming on to be heard, is submitted for decree on the pleadings and proof, and the same having been fully argued by counsel and duly considered by the court, the court is of opinion that the complainant is entitled to relief.

"1. It is therefore ordered, adjudged and decreed that the defendant, Home Telephone company, its officers, solicitors, agents, servants and employes, and each of them, be perpetually enjoined and restrained from directly or indirectly making or causing to be made, or using or causing to be used, or vending to others to be used, or distributing in any manner, the combination of multiple switchboards and telephone exchange apparatus made in accordance with or embodying or containing any of the inventions or improvements as described and claimed in claims two (2) and four (4) in the letters patent, the subject-matter of this suit, and from vending or distributing any such combination of multiple switchboards and telephone exchange apparatus, and from infringing upon or violating the said letters patent in any way.

"2. And it is also ordered, adjudged and decreed that said defendant, the Home Telephone company, forthwith destroy or deliver up to the complainant the combination of all the multiple switchboards in their possession, made in accordance with said claims two (2) and four (4) of said letters patent.

"It is, however, ordered that the injunction herein provided for shall not be operative until sixty (60) days from the date of this decree.

"3. It is also further ordered, adjudged and decreed that the bill as to defendants Albert S. Lyons and Adam Glass be dismissed at the complainant's cost.

"4. It is further ordered, adjudged and decreed, since complainant waives its right to a reference to a master for an accounting against the defendant, the Home Telephone company, that the said defendant pay complainant two cents as nominal damages and the costs of this suit."

Hudson Telephone Company.

Mention was made last week of the dispute between stockholders of the Hudson Telephone company of Jersey City, N. J. The following communication has since been received:

In order to prevent your being misinformed by Associated Press dispatches published in many papers and accounts in local papers of a bill being filed February 9th, asking for a receiver for the Hudson Telephone company and making charges against its officers, I write to say that no such bill has been filed and is not likely to be. I enclose you published denials on my part, which will be followed by those of others concerned. The matter is a libel published to injure the company.

This letter was signed by George H. Atkinson, as were also several statements published in the Jersey City News of February 8th, in which all the charges made against him and his management of the Hudson Telephone company are denied in detail.

Telephone Rates.

A dispatch from Lincoln, Neb., says that on February 16th "The case of Omaha citizens against the Nebraska Telephone company for a reduction of tolls from $5 to $3 per instrument was argued in the Supreme Court. The District Court at Omaha declared in favor of the citizens' petition and the company appealed. If the decision in the Supreme Court is against the company it will be carried to the court of last resort. The officials of the company declare they must go out of business if the reduction in rates is enforced, that it will be equal to the confiscation of the property of the company, and that, therefore, the federal courts may interfere."

Anti-Bell Movement in Western New York.

From the Niagara Falls correspondent of the Western Electrician.

The Western New York Telephone company has been incorporated with a capital stock of $500,000, to operate a telephone system in Buffalo and in the cities and villages of the counties of Erie, Niagara, Orleans, Genesee, Cattaraugus and Chautauqua. The directors and principal stockholders are: Edward Michael, $150,000 of stock. Henry Koons, $120,000. Alonzo K. Jones, Tracy C. Becker, L. P. Wesser and Isadore Michael, each $50,000; W. S. Grattan, $10,000, all of whom are of Buffalo, and Richard F. Rankine and Spencer J. Lawrence of Niagara Falls, each $10,000.

Messrs. Becker, Koons and Michael are men who are also interested in the National Electrolytic company of Niagara Falls, while Richard F. Rankine is secretary and treasurer of the Niagara Falls Paper company and a brother of William B. Rankine, secretary and treasurer of the Niagara Falls Power company. The company is certainly one of the best and strongest independent telephone companies organized in a long time. The territory in which it expects to operate is one in which the people are very anxious to be relieved of the Bell methods, and they will eagerly become patrons of a company that by its strength offers to give them a good service. It is probable that the company will use the automatic system. Tracy C. Becker says: "We are going into the business with our eyes open, and with a practically unlimited amount of capital, and we will spare no pains or expense to make it a success in every sense of the word. Until our plans are perfected, however, we deem it is best to keep the matter largely to ourselves."

New G. E. Motors.

The General Electric company announces a new line of direct-current motors of small capacity adapted to the direct application of power to small machines of all kinds. The new motors have been given the designation of "Type C A," and in their design the production of an efficient motor, sufficiently light and compact to allow of installation in cases where space is limited and absolutely rigid support unobtainable, has been kept constantly in view. A magnetic circuit, therefore, entirely of laminated

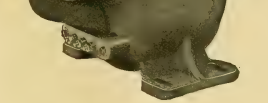


Fig. 1.

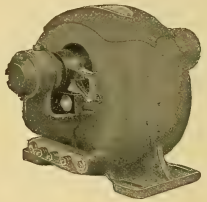

Fig. 2.

Fig. 3.

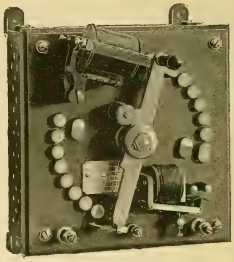

Fig. 4.

NEW G. E. MOTORS.

iron has been adopted, and greater lightness and compactness thus secured than would have been possible with cast iron. Furthermore, by the use of laminated iron a uniform magnetic circuit is insured. The construction of the armature, commutator and field coils follows closely that in the standard General Electric railway motors. The laminated armature core is toothed and wound with the Beckemeyer type coil. The leads from the armature are soldered directly into slots in the segments and the field coils are thoroughly taped and mounted on laminated pole-pieces. The armature can be withdrawn after taking off the pulley end bearing, and the field coils removed through an opening in the frame. In the larger machines the shaft is mounted on two similar swivel bearings, each self-oiling. The brush-holders are adjustable radially, and may be revolved around the commutator as required. The neutral point is very wide, however, and no adjustment of the brush-holder is necessary.

These motors are enclosed and thoroughly protected from mechanical injury, but thorough ventilation is provided by holes in the bottom of the case and around the commutator end of the armature. Should these motors be used in places where flying dust necessitates extra protection, the commutator and brush-holders may also be encased.

The speeds are lower than usual with motors of small capacity. Better provision for overload is thus given and losses are not so great. The regulation, efficiency and disposition of the material in the "C A" motors also combine to give them a continued high economy. Heating tests show that they will run continuously with but slight increase in temperature, and even with a momentary overload of 100 per cent. little or no sparking is noticeable. In cases where a number of these motors are required to meet special conditions, the standard construction and wiring are susceptible of modification.

No rails are necessary with this motor. The belt is tightened by moving the motor on the lag-screws, which pass through elongated holes in the feet of the frame and hold the motor in place.

One feature of advantage is the possibility of placing it in almost any position with no greater change than the turning of the bearings to suit the position selected. The "C A" motor may be installed on the floor or be suspended from the ceiling, be set on a shelf or attached to a wall. In every case the oil collar is at the bottom of the bearing.

The one horse power (Fig. 1) and one-half horse power (Fig. 2) "C A" motors are designed for 115, 230 and 500-volt circuits; the one-eighth horse power (Fig. 3) size is for 115-volt circuits. The floor space for the first named is only 22⅛ inches by 16½ inches, and for the one-half horse power motor 18⅝ inches by 13 inches. The motors are finished in black, with brush-holders and small parts nickeled and polished.

For use with the two larger sizes a new type of rheostat (Fig. 4) has been developed. It is provided with an automatic switch which breaks the circuit in case of overload and effectually protects the motor armature. The smaller sizes are series-wound and require no rheostat.

Diesel's Caloric Motor.

The work of Rudolf Diessel in the development of the caloric motor at Munich is attracting much attention in engineering circles. These investigations formed the subject of an interesting article in the Western Electrician of November 6, 1897, which may now be supplemented by the following facts:

In the Diesel motor it is claimed that pure air is compressed in the cylinder, thus generating a temperature of about 600 degrees C. The fuel to be used, such as gas, petroleum or powdered coal, is injected into the compressed air, where it is gradually and completely burned up at a much lower temperature than ever before accomplished. During combustion and during the succeeding expansion, it is entirely turned into work. The injection and combustion of the fuel take place as the piston in the cylinder begins its return stroke. It ceases when it has reached about one eighth or one-sixth of its way back and it is so regulated that the increase in the temperature created by the compression of the air and subsequent combustion of the fuel, is reduced by the cooling off due to the work done during the succeeding expansion. Thus, practically, there is no increase in sensible heat, since the heat caused by the combustion of the fuel is immediately turned into power, and the motive power thus gained

is only reduced by the small amount required for the compression of the air.

The construction of the Diessel motor is much simpler, and therefore subject to less repairs, as, in comparison with the ordinary gas or oil engines, no igniter, gas atomizer or mixer is necessary, while compared with steam engines, no boiler, condenser or coal bunkers are required, an advantage which can hardly be over-estimated in steamship building. The injection and combustion of the fuel can be regulated automatically according to the power required, and changes in the load of the motor are governed to a nicety. The motor can be set to work without loss of time, since, once operated, it is again started by simply opening a valve admitting the stored compressed air into the cylinder. It runs almost noiselessly and without shock or jar, and in this differs materially from the best existing gas or oil engines. The interior parts will not soil, as the fuel used is completely consumed, which is shown not only by a chemical analysis of the waste gases, but also by their absolutely odorless escape into the air.

Thus far the fuel used has been mainly petroleum, but it has been demonstrated that common illuminating gas is a perfect material for this purpose, and the use of producer gas at American prices would, it is estimated, furnish power at one-half the cost of the steam generated with coal.

Expert commissions have been sent to Augsburg, where the motor has been in actual operation for fully a year, and their unanimous testimony gives the general verdict that its advent must be hailed as the beginning of a new chapter in the application of heat as a motive power. At Nuernberg, Diessel's motors are being built at present for street cars and general railroad work.

The Diessel motor rights for the United States and Canada have been acquired by a company incorporated under the laws of New York state as the Diessel Motor company of America, with offices at No. 11 Broadway, New York.

Large Three-phase Lighting Station in Boston.

The Boston Electric Light company has concluded a contract with the General Electric company for the equipment of its great generating station, now in course of erection. Up to the present this company has operated a number of stations throughout Boston. Two of these, however, have recently been abandoned to make way for the new railroad stations now being built, and the company has, therefore, decided to consolidate all the small stations into one mammoth generating plant to be erected in South Boston.

The system will involve the use of the three-phase alternating current, selected on account of its greater flexibility and the fact that by its use the value of the present distributing system will not be diminished. The dynamos will be four in number, each of 1,500 kilowatts, with a reserve capacity of 50 per cent., giving a total output of 12,000 horse power. They will be of the revolving-field type—a type adopted to permit a high voltage to be taken directly from the dynamo to the wires without the use of transformers to increase the pressure. The revolving field on each dynamo will be mounted on the shaft of an engine, and the voltage of the generated current will be 2,200 volts. To excite these dynamos, two smaller ones, each of 100 horse power, driven by synchronous motors, will be provided. In addition 18 large synchronous motors, each of 200 horse power, will drive 36 arc-lighting machines. Each motor will be set between two Brush 125-light arc dynamos, the shaft of the motor armature being extended to become the shaft of the armature of the arc dynamos. The power transmission for this arc lighting plant, therefore, will be confined to the width of the dynamo room. If this system were not employed small engines would have to be used, whereas by the method selected only the large main engines will be employed.

For the power circuits, that is for the stationary motors, two rotary converters, each of 500 kilowatts, or 650 horse power, are included in the contract. These will take the three-phase alternating current and convert it into direct current at about 550 volts. For the incandescent lighting system, the three-phase current wires will simply be connected to the existing network, using the transformers now in use.

Portable Acetylene Lamps.

A new factory, now being built on the property of the Niagara Falls Power company at Niagara Falls, is to be used for the manufacture of portable lamps, in which the fuel will be acetylene gas generated from carbide stored in cartridge form in the lamp. When the lamp needs "refilling" all that will be required will be to take out the old cartridge and insert a fresh one. The carbide for charging these cartridges is to be obtained of the Acetylene Light, Heat and Power company, whose plant is situated close by the new factory, so that there will be no expense of transportation from one plant to the other. The factory building [illegible] of frame, two stories high and 50 by 100 feet at the foundation. It is being erected by the Electro-gas company of New York for another body of men, who will put the experiments and theories of the first mentioned company into practical use. It is understood that experiments extending over a period of several months have been made in burning acetylene in all styles of lamps, from those used for household purposes to the bicycle and carriage lamp, as well as lanterns, and that the experiments have been successful.

New York Electrical Exhibition.

Following is a list of exhibitors who have secured space for the electrical exhibition at Madison Square Garden during the month of May:

Armorite Interior Conduit company........Pittsburg, Pa.
American Rheostat company............Milwaukee, Wis.
American Electric Cold Supply company.Brooklyn, N. Y.
American Pulley company............Philadelphia, Pa.
American Watchman's Time Detector.........New York.
American Engine company..........Bound Brook, N. J.
Adams-Bagnall Electric company........Cleveland, Ohio.
Arminton & Sims company...........Providence, R. I.
American Electrician company...............New York.
American Electrical and Maintenance company.......New York.
American Electrical Works............Providence, R. I.

Bullock Electric company...................New York.
Bossert Electric Construction company......Utica, N. Y.
Baylis company, The........................New York.
Bernard, E. G..............................Troy, N. Y.
Borne-Scrymser company.....................New York.
Belknap Motor company..................Portland, Me.
Brewster Engineering company...............New York.

Crocker-Wheeler Electric company...........New York.
C. & C. Electric company...................New York.
Corey, R. B................................New York.
Cobo & Co., H. B...........................New York.
Christensen Air-brake company.........Milwaukee, Wis.
Card Electric company.................Mansfield, Ohio.
Cleveland Twist Drill company.........Cleveland, Ohio.
Crouse-Tremaine Carbon company........Fostoria, Ohio.
Connecticut Telephone and Electric company.......Meriden, Conn.
Crown Woven Wire Brush company........Salem, Mass.
Cook's Sons, Adam..........................New York.
Campbell Underground Trolley company...Towanda, Pa.
Camp company, H. B....................Aultman, Ohio.

De La Vergne Refrigerator company..........New York.
Diamond Electric company.................Peoria, Ill.
Diesel Motor Company of America............New York.

Edison, Thomas A.......................Orange, N. J.
Edison Electric Illuminating company.......New York.
Eddy Electric Manufacturing company...Windsor, Conn.
Electric Storage Battery company......Philadelphia, Pa.
Excelsior Electric company.............Brooklyn, N. Y.
Edison Manufacturing company...........Orange, N. J.
Edison, Jr., Thomas A......................New York.
Electrical Engineer........................New York.
Electrical Review..........................New York.
Electrical Age Publishing company..........New York.
Electricity Newspaper company..............New York.

Fisher Foundry and Machine company....Pittsburg, Pa.
Fort Wayne Electric Corporation.......Fort Wayne, Ind.
Fuel Economizer company............Matteawan, N. Y.
Fostoria Incandescent Lamp company....Fostoria, Ohio.
Fiberite company...................Mechanicville, N. Y.
Fairchild & Sumner.........................New York.

Gold Car Heating Company...................New York.

Harrison Safety Boiler Works.......Germantown Junction, Philadelphia.
Highland Chemical company..........Connellsville, Pa.
Haines company, William S...........Philadelphia, Pa.
Haring Steam-plant Equipment company......New York.

Ideal Electric corporation.................New York.
Imperial Porcelain Works.................Trenton, N. J.
India Rubber and Gutta Percha Insulating company.......Glenwood, N. Y.

Jones & Son, J.............................New York.
Johnston company, W. J.....................New York.
Keuffel & Esser company....................New York.
Kelley & Sons, B. F........................New York.
Keystone Electrical Instrument company.......Philadelphia, Pa.

Lawrence Machine company............Lawrence, Mass.
Lewis Tool company.........................New York.
Lynn Incandescent Lamp company..........Lynn, Mass.

Morris, Elmer P............................New York.
Machado & Roller...........................New York.
Mowrey & Co., P. M.........................New York.

Niles Tool Works company.......Hamilton, Ohio, and New York.
National Meter company.....................New York.
Nowotny Electric company............Cincinnati, Ohio.
National Carbon company.............Cleveland, Ohio.
Nash Gas Engine company....................New York.
New Britain Machine company.......New Britain, Conn.
New York Safety Steam Power company........New York.

Oswego Boiler Works....................Oswego, N. Y.
Otis Electric company......................New York.
Onondaga Dynamo company..............Syracuse, N. Y.

Paragon Arc Lamp company..............Boston, Mass.
Peru Electric Manufacturing company.........Peru, Ind.
Peckham Motor Truck and Wheel company...New York.
Patrick, Carter & Wilkins............Philadelphia, Pa.
Paragon Motor company......................New York.
Porter & Remsen............................New York.

Roebling's Sons company, John A.........Trenton, N. J.

Safety Insulated Wire and Cable company....New York.
Stephenson company, Limited, John..........New York.
Silex Insulation company...................New York.
Sprague Electric company...................New York.
Simonds Manufacturing company..........Pittsburg, Pa.
Sinclair, D. J.......................Caledonia, N. Y.

Translucent Fabric company............Quincy, Mass.
Thomas & Sons company, R......East Liverpool, Ohio.

United States Electrical Supply company.....New York.

Vacuum Oil company...................Rochester, N. Y.
Van Horne, Burger & Co.................Dayton, Ohio.

Worthington, Henry R.......................New York.
Walker company.......................Cleveland, Ohio.
Weston Electrical Instrument company...Newark, N. J.
Warren Electric Manufacturing company.Sandusky, Ohio.
Williams & Co., J. H...................Brooklyn, N. Y.
Wendell & McDuffie.........................New York.
White, J. G., & Co.........................New York.
Western Electrician..........................Chicago.
Worthington Water-tube Boiler..............New York.

Zundars & Hunt.............................New York.

Electrical Interests of Texas and Mexico.

As already announced in the Western Electrician, there will be a joint meeting of the Texas Gas and Electric Light association, the Texas Street Railway association and the gas, electric and street-railway men of Mexico, at Laredo, Texas, beginning March 9th and continuing until March 12th. This will be the fourth annual meeting of the lighting association and the fifth annual meeting of the street-railway association. The fact that it will be an international meeting and will be largely attended by those interested in gas, electricity, street railways and related industries in both countries gives it unusual prominence and importance, not only to those directly interested in the business, but also to all who desire to protect and advance the trade relations and mutual interests of the two nations.

The opening session will be a joint meeting at which addresses of welcome and responses will be made and the work of the associations outlined. Separate meetings of the organizations will be held on the following days, at which papers prepared by members will be read. The evening sessions will be joint meetings, and at each of these a lecture on a subject of general interest will be delivered.

Among the papers to be read before the street-railway men will be one by H. C. Chase of Houston on "Rail Bonding as a Power Saver." There are several announcements of special interest to electric-lighting interests. The subject of "Meter vs. Flat Rates" will be discussed by J. R. Cullinane of Denison. "Uniform Voltage and Continuous Service" is the title of a paper promised by George R. Cushman of San Antonio, and "Rates for Electric Lighting" will be considered by E. L. Wells, Jr., of Marshall. At the first evening session Harry L. Monroe of Dallas will read a paper on "Use and Abuse of Electrical Machinery, Apparatus and Appliances," and the second evening will be occupied by J. D. Cox of Galveston, who will present a paper on "An Electric Furnace, Calcium Carbide, Acetylene Gas and Other Forms of Gas."

Several excursions will be made to coal, silver and gold mines in the vicinity and to Monterey, Mexico, and on Sunday, March 13th, it is announced that those who desire may see "el Toro" in the afternoon. An "international banquet" has also been arranged.

It is stated that the Mexicans who are connected with the lighting, street-railway and power plants of the Republic of Mexico have evidenced great interest in the proposed meeting and that the Mexican government has, through its Department of Foreign Affairs and through Senor P. Ornelas, Mexican consul at San Antonio, expressed interest in and tendered offers of assistance, as far as possible, for a successful meeting. A large attendance is expected from Mexico. It is promised that hotel accommodations will be ample and that a large and convenient hall, with light and power service, will be available for exhibits. Charles F. Yaeger of Laredo, Texas, is the chairman of the local committee of arrangements, and Carl F. Drake of Austin, Texas, is the chairman of the committee on transportation.

City Ownership of Street-railway Lines.

According to a London correspondent, Sir Bosdin Leech has vindicated the policy of tramway municipalization in an exhaustive paper read before the Statistical society of Manchester, where the City Council has decided to adopt electric traction and to operate all tram lines after 1901. The principle of the municipal operation of tramways is now regarded by reformers as on a level with corporation ownership of water, gas and electric supplies, and, according to the same writer, it has proved a successful experiment wherever it has been tried.

A great impression was produced by the paper by Mr. Philip Dawson on electric railways read before the Institution of Mechanical Engineers. He contrasted the mileage of electric railways in the United States and the United Kingdom, the figures being 12,583 against 167, and explained that private enterprise was not restricted in the one country by legislation, whereas it is paralyzed in the other. Municipal councils are finding out they are behind the times and are rushing to electric traction with overhead wires, whereas they might easily get a better system by sending experts to Budapest.

A Great Electrical Undertaking in New York.

Dr. Louis Duncan of Baltimore has been appointed consulting electrical engineer to the Third Avenue Railroad company of New York city. It is said that the company intends to adopt electric traction on all of its existing lines and on others to be built. The improvements contemplated will cost several millions of dollars.

Fighting the Western Union's Mexican Contract.

The railroads of Mexico have filed a strong protest with the Mexican government against the contract recently entered into between the Western Union and the Federal Telegraph company and the federal government giving the Western Union exclusive control of the international commercial tele-

graph business of that country. The railroads say that this contract is a violation of their respective concessions. The Western Union service in Mexico was to begin on January 5th, but was postponed pending a decision from the government.

Death of J. H. Rhotehamel.

James H. Rhotehamel, the president of the Columbia Incandescent Lamp company of St. Louis and one of the leading lampmakers of the country, died on Thursday morning, February 17th, after a brief illness. The sad news comes to Chicago as the Western Electrician is going to press, and full particulars of Mr. Rhotehamel's illness and death are not attainable at this writing. Mr. Rhotehamel was about 42 years of age and a native of Ohio. He had been prominent in the incandescent-lamp industry for the last 10 years, and he built up a large business. At the time of the prosecution of the infringement suits on the Edison incandescent-lamp patent several years ago, Mr. Rhotehamel made a vigorous fight against the claims of the General Electric company, on behalf of his company, and brought forward the celebrated Goebel defense, which, in his case, was successful. He was widely known in electrical circles all over the country and was active in all concerted movements of the branch of the industry with which he was connected. His death will be sincerely regretted. The deceased leaves a wife and an infant son.

Death of H. W. Johns.

Henry W. Johns, known to the electrical trade by the insulation and insulating devices made by the company bearing his name, died at his home at Park Hill, Yonkers, N. Y., on February 8th, after an illness of several months. Mr. Johns was born in West Stockbridge, Mass., in 1837, and at an early age came to New York, engaging for a short time in various lines of business before entering upon that which was to be his life work. In 1858, while experimenting with a view to perfecting a fireproof compound, he learned of the existence of asbestos, an indestructible fibrous mineral, at that time but little known outside of laboratories and mineralogical collections. From this time until his death he worked continuously at the development of its commercial uses, and built up a large business based upon his numerous inventions. Mr. Johns was president of the H. W. Johns Manufacturing company and of the Johns-Pratt company of Hartford. He was also at one time a director in the Western National Bank of New York.

COMMUNICATION.

Alleged Infringement of Lamp Filament Patent.

To the Editor of the Western Electrician:

As there has lately been some accounts in the newspapers referring to the matter of our having been sued by the trust for alleged infringement of what is known as the Weston patent, which is a patent on the cellulose filament, we request that if you are going to take any notice of the matter, you at least favor us with a fair statement of the case.

Of course you will understand that the suit is one of the suits that are instituted by the trust against all lamp manufacturers who decline to enter the trust or pay a license to it. The alleged infringement of their patent, we are confident, we can successfully defend, the filament used by us being one that is covered by good patents.

We have had good counsel on the matter, both since the suit was instituted and before we engaged in the manufacture of lamps, and are satisfied in our ability to defend our position.

We have no objection to the matter being published, but would be obliged to you if you would state our side of the case.

K. & W. COMPANY.
F. R. Whittlesey, Treasurer.

Pittsfield, Mass., February 15, 1898.

CORRESPONDENCE.

New York Notes.

New York, February 15.—A curious fatality was that by which Winfield S. McDowell, an electrician, lost his life a week ago to-day. Mr. McDowell was not in the employment of any electrical company, but worked for himself, putting in wires or repairing breaks wherever he could find a job. He was doing some work under the sidewalk of the building at 40 and 42 Broadway, and the police think he was trying to tap the telegraph wires under Broadway for the benefit of some poolroom or bucket-shop, when he met his death. No one could be found to admit knowledge of his presence, and yet he had been working in the sub cellar which abuts on Broadway long enough to cut a hole two feet square in a retaining wall 16 inches thick, and made of undressed stone and cement. There are two retaining walls between the sub-cellar and the street, and a space of over three feet between them is filled with tightly-packed sand. McDowell cut a hole through the first wall, but evidently knew nothing of the existence of the outer wall, for he was trying to drive a two-inch iron pipe through the sand to what, it is presumed, he thought was the conduit which holds the wires which run under Broadway. The pipe struck against the outer wall. Not knowing what the obstacle was, he decided to investigate, so making a tunnel in the sand large enough for his body he crawled into the hole. The sand, loosened by the tunnel he had made and by the jar of pedestrians on the sidewalk overhead, came tumbling down upon him. Caught as he was in the hole, with the weight of the sand on his head and body, he was unable to extricate himself and was smothered to death. The first that was known of his death was when the engineer of the building, coming, it is said, to inspect the tank which supplies the water for the elevator, and which is situated in front of the sub-cellar, saw the man's feet sticking out from the hole in the wall. He called for assistance, and the body was pulled out. All the employes in the building denied emphatically that they knew the man was at work. The dead man lived in Flatbush and leaves a widow and two children.

President Gould, of the Manhattan company, has asked for a conference with the Rapid Transit commissioners, and the meetings will be arranged, but it is not expected that the discussion will be made public until a final report is made. George J. Gould, Robert M. Gallaway, Russell Sage and Marcellus Hartley will represent the Manhattan directors. "This committee," says Mr. Gould, writing to the commissioners, "will furnish your board such further definite and specific information as may be possible, and as speedily as it can be prepared by our engineers, on the following matters referred to in your letter: (1) A detailed description of the structures to be located on the proposed routes, (2) the time within which the connecting and extending railways and additional tracks and facilities will be constructed, (3) the grade of the proposed crossings, and (4) definite information on all other points which may appear to your board and this company to be pertinent to the matters under consideration, or which can in any manner facilitate your board and expedite action on the application now pending." It will be observed that no direct reference is made to the electrical equipment of the elevated system.

Counsel for the Rapid Transit Commission appeared before the Appellate Division of the Supreme Court on Friday to move for a reargument of the motion for the confirmation of the report made by the Supreme Court commissioners favoring the construction of the underground railway. Opposing attorneys appeared to represent property owners who object to the construction of the tunnel. There was no argument in the case, counsel merely submitting briefs, which were taken by the court, decision being withheld. The lawyers for the Rapid Transit Board ask that the $15,000,000 bond stipulation be modified.

John Sabine Smith, one of the three special commissioners appointed by the Supreme Court to inquire into the feasibility of the Rapid Transit commissioners' tunnel plans, has made a motion before the Appellate Division asking that it grant compensation to the three commissioners. He asked for an allowance of $15,000 each. The other commissioners are Arthur D. Williams and G. W. Young. Decision was reserved.

The committee on rapid transit of the Real Estate Exchange reaffirms its position by asserting its belief that true rapid transit can only be obtained by the construction of a four-track underground railroad, but it suggests that the Rapid Transit commissioners give consideration to the immediate necessity of granting some relief through the existing elevated railroad. M. S.

Washington, D. C.

Washington, February 15.—The District commissioners have completed the draft of an electrolysis bill on which they have been working and have been working and have transmitted it to Congress. The bill provides for the regulation of the laying and grounding of underground electric-light and power wires, and the construction of trolley systems. Captain Burr, assistant to the District engineer, submitted a report with the bill on the subject of electrolytic action on pipes, etc., underground in the streets of the city. In this report Capt. Burr declares that with the large increase of late years in the use of electricity for lighting and power purposes, the damage resulting to underground metallic constructions from the use of the ground or uninsulated returns has greatly increased, and the evils from such an incomplete system of distribution for electricity are beginning to be fairly realized. With the absence of overhead trolley roads in the city of Washington the question of electrolytic action has heretofore been an unimportant one. Conditions, however, have changed so markedly within the last two years that it should have immediate attention. "Recently," continues the report, "a large central-power station has been established within the city limits from which nearly all the trolley roads in the District and some in Virginia and Maryland obtain their power. This station also furnishes current for private and public lighting at various points within the District. Current so generated is constantly delivered to many points, some of which are a number of miles distant. In many instances this current has to find its way back to the station through the ground and such metallic construction in it as offer the least resistance, no proper metallic return having been provided." After summing up the conditions existing among the electric roads in the District very exhaustively, the bill is reported, which provides that each street-railway company in the District using the single overhead trolley system, or using any other electrical system, employing an uninsulated, a grounded, or a rail return or feeding circuit for the current, shall equip its lines with the double-trolley system, or other equally good insulated metallic-circuit system, subject to the approval of the commissioners, sixty days from the date of passage being allowed for the filing with the commissioners of plans of the new system to be employed. Three months after the approval of the plan the company shall fully carry out its requirements. A penalty of $25 a day is fixed for non-compliance with the law. The second section of the proposed act makes it unlawful for any person, company or corporation in the District to furnish current for electric light, heat or power, on a circuit or system, any portion of which is grounded or connected to any grounded construction, or which is not thoroughly insulated from the ground. It shall also be unlawful for anyone to operate an electrical generating or transforming machine, any pole or terminal of which is grounded or connected with a grounded construction. Thirty days are given for the filling of plans of changes, and 60 days allowed after the approval of the plans by the commissioners for their proper execution. The penalty is the same as in section 1.

An amendment to the District appropriation bill provides that the sum of $60,000 be appropriated for electric arc lighting, including necessary inspection for the streets of the city of Washington.

The Senate sub-committee in charge of street railways has reported the bill to authorize the installation of the underground system of electric propulsion for the Eckington and Soldiers' Home railroad.

President Crosby of the Potomac Electric Lighting company has asked for an extension of the time when overhead wires may be used west of Rock Creek. As the people of that vicinity are dependent upon the Potomac company for electric lights, it is thought that the request may be granted.

The bill to authorize the Washington and Glen Echo Railroad company to obtain a right of way, etc., has been reported adversely, and postponed indefinitely.

The annual report of the president of the Columbia Railway company of the District of Columbia states that the total receipts during the year 1897 were $168,721.03. The total operating expenses during the year were $171,866.58. The total receipts of the Washington and Great Falls company for the year were $49,733.74, and the total disbursements $47,188.29. The total receipts of the Georgetown and Tennallytown Railroad company were $38,336.15, and total expenditures, $38,336.65.

The public printer has been authorized to place one six-pin cross-arm on each of 11 poles now erected on North Capitol street, between G and B streets, and to string thereon six telephone wires for use between the Government Printing Office and the United States Senate and House of Representatives.

The Electric Railway Equipment company of this city has been granted a charter. Mr. A. C. Greenlees of Washington is the president, and the capital stock is placed at $100,000.

The expenditures of the Postoffice Department for electric light and gas lighting during the last fiscal year were $3,703.68; the appropriation was $5,250; therefore the amount unexpended by the department was $1,346.32. The department expended $2,417.26 for telegrams, with an unexpended balance of $82.74.

According to Public Printer Palmer's report for the fiscal year, during that period there was expended for light, in the Government Printing Office, $2,262.97 for electricity and $2,672.50 for gas. Electric supplies cost $7,232.76. T. I. P.

Northwestern Notations.

Minneapolis, February 15.—The Minneapolis Street Railway company is now using the power from the new dam to operate all the cars of Minneapolis and the Minneapolis end of the Interurban line. The Thirty-first street power house has been shut down for good, but the Third avenue north power station will be kept in readiness against any accident that may occur.

Waterloo, Ia., is being canvassed in the interest of a co-operative electric-light system. The estimated cost of a plant is $10,000.

The Citizens' Electric Light company of Lewistown, Mont., has been incorporated with $10,000 capital stock to put in an electric-light plant.

The Minneapolis General Electric company will abandon the power station in the Edison building, Minneapolis, and use it only for a distributing point. All the power now comes from the station at Third avenue southeast and the river.

Patrons of the electric-light company at Albert Lea, Minn., held a meeting to complain of the service and the way the meters worked. It was alleged that sometimes the meters failed to register when the light was used and other times they registered when there was none used. There is some talk of a municipal electric-light plant for the city.

The electric railway of Ottumwa, Ia., will be sold at auction on a mortgage of $236,000, by order of the federal court. The plant cost $425,000 to $500,000, and includes a street-railway system. Under the management of Receiver Merrill the expenses have been reduced until the plant is on a paying basis.

Sheboygan, Wis., wants railroad connection with the Chicago, Milwaukee and St. Paul at Random Lake, and the Advancement association has been agitating it. John M. Saemann has now made a proposition to give not only connection for steam cars, but also to operate an electric-car line between these points, if given a bonus of $45,000. The estimated cost of the line is $335,000 to $340,000. He proposes to put on heavy motors, to run at a speed of 45 miles an hour, and make hourly trips.

The contract of the city of Des Moines, Ia., with McCaskey & Holcomb for the construction of an electric-light plant has been declared void and the election which authorized it illegal, for the reason that the two propositions were contradictory.

The Appleton Electric and Power company of Appleton, Wis., is preparing to make some improvements to its power house. New water wheels will be put in and the flume straightened and improved. The changes are to be completed by April 1st.

Christian A. Stengle, an old telegraph operator, died suddenly at his home in Minneapolis recently. Stengle was the first operator to receive a telegram in Sweden in the early '50's. He was nearly 40 years an operator, and was finally retired on a pension from the government, which operates the telegraph lines in Sweden. He has lived in Minneapolis about 10 years.

The street-railway company has abandoned the attempt to get together with the council of St. Paul to secure an ordinance to run express trains between Minneapolis and St. Paul. The company will now endeavor to secure an ordinance for changing the Selby avenue cable into electric and for the Como Park line to Minneapolis. To these it is understood the council has no objection.

Charles C. Deering and C. C. Wells have formed an electrical firm in Boone, Ia.

The aldermen of Casselton, N. D., have decided on a rate of 40 cents for 16 candle power incandescent lights, and will make special rates for hotels, lodge-rooms and churches. This is looked upon by many as too low a rate to operate the plant profitably.

There is talk of putting in an alternating system of lighting at Springfield, Minn. The present system is overloaded and is an incandescent system on an arc plant, which is unsatisfactory.

The North American Telegraph company held its annual meeting in Minneapolis a few days ago. Clinton Morrison was elected president; W. R. Merriam, vice-president, and H. A. Tuttle secretary and general manager. H. F. Brown declined to be re-elected as treasurer, and E. C. Cook was chosen. A semi-annual dividend of 2½ per cent. was declared.

J. J. McGeehan, a prominent logger of Ashland, Wis., is about to put in an electric-light plant at Orienta, Wis., to enable him to raft and sort logs by night. Incandescents will be used in the sorting pond and arcs in the bay.

A fender on a street car in Duluth, Minn., recently saved a small boy's life. The youngster was sliding down a steep hill and met the car also coming down, both going at a good speed. It was impossible for the motorman to stop the car and the boy was struck by the fender and picked up. He was carried a few feet, but sustained no injuries whatever.

J. A. Brown of Moline, Ill., is negotiating with Fairfield, Ia., citizens with a view to starting a factory there for the manufacture of electrical supplies.

M. H. Gerry, Jr., of Minneapolis, an electrical engineer, has opened the cabinet in connection with the Bankers' Electric Protection company's system, without sounding the outside gong. Gerry examined the device, which has been put in several local banks, and said he believed he could open the cabinet door enclosing the vault door without setting off the alarm. The bankers desired a thorough test and allowed him to examine the system from all points, and after becoming familiar with it, to test it. He strung wires to cut off the door, and, after 30 minutes' work, unlocked and opened the cabinet door. The bankers feel that he had chances to get at the device that no burglar ever could and had everything in his favor. They are convinced the system is the nearest approach to perfection that has been discovered.

C. G. Edwards, manager of the electric-light plant of Albert Lea, Minn., has invented a device for attaching and detaching electric lamps from sockets. The device is arranged so that it can be extended almost any length, and will be of great use in churches, theaters, halls and any high room in removing dead lamps, where the height is such that a ladder is not available. A number of orders have already been placed, though there has not been any effort to make sales. The application for the patent is now pending.

The Chippewa Valley Electric Railway company is arranging to construct a line between Eau Claire and Chippewa Falls, Wis., in the early spring.

The Patton system is to be used for a line between Grundy Center and Waterloo, Ia. C. W. McElyea, who has put in a line at Cedar Falls, will construct the system. It is proposed in time to extend the line to Eldora, Nevada and Des Moines.

It is suggested at Fairmont, Minn., that an electric-car line be constructed to Armstrong, Ia., to connect with the Burlington railroad.

The Park Board of St. Paul has selected a route for another interurban car line to Minneapolis, through St. Anthony Park, via Langford avenue. It is to go through Como Park, St. Paul, and will be built as far as possible to avoid surface crossings in the park.

The Seattle (Wash.) City Railway company contemplates reconstructing its line along Yesler way and changing its power house to another location.

Minneapolis aldermen are inclined to be a little dubious over the value of street sprinkling from street cars, in accordance with a proposition recently made.

C.

PERSONAL.

C. J. Sturgeon, manager of the electric department of the Erie City Iron Wroks, Erie, Pa., passed through Chicago this week.

The Atlanta (Ga.) Consolidated Street Railway company has elected Ernest Woodruff president to fill the place formerly held by Joel Hurt.

C. D. Crandall of the Western Electric company of Chicago is enjoying a southern trip. Mr. Crandall will probably visit several points in Mexico before his return.

ELECTRIC LIGHTING.

The Hampton (Va.) and Old Point Gas and Electric company has been incorporated, with capital stock of $75,000, to furnish illumination.

Contract has been awarded to the Fort Wayne Electric corporation by the city of Grafton, W. Va., for the erection of an $8,600 lighting plant.

The city of Albany, Ga., contemplates the purchase of the Albany Illuminating company's plant and the expenditure of $5,000 on improvements.

W. J. Hoffman and J. K. Wright have a franchise to light the town of Chestertown, Md., and will erect an electric plant at a probable cost of $15,000.

The citizens of Rogersville, Tenn., have voted adversely in the election for erection of electric-light and water works, but a franchise may be granted to a company. Mayor H. J. Nelson may be addressed.

The City Council of Hot Springs, Ark., has in consideration the establishment of electric-light and water-works. If definite arrangements are made, the Board of Public Affairs will have the matter in charge.

The Catonsville Ice, Light and Power company of Catonsville, Baltimore, Md., will probably arrange with the Ellicott City Council for lighting the city. A plant to cost $40,000 will be erected in the event of the proposed arrangement being completed.

B. B. Linehan, the vice-president of the Star Electric company of Dubuque, Iowa, has by purchase acquired all the stock of that company. The company was incorporated in 1892 with a capital stock of $100,000. It is said that Mr. Linehan will add a steam-heating department to the business.

The Washington County Electric company of Hagerstown, Md., has been incorporated by Christian W. Lynch, William Jennings, of Harrisburg, Pa.; J. Clarence Lane, J. Irvin Bitner and William Hepperle, of Hagerstown. The company has applied for franchise, and will erect a lighting and power plant.

ELECTRIC RAILWAYS.

In consideration of $300 cash and the additional sum of $1,200 to be paid in two years, it is said that the trustees of Lake Bluff, Ill., have given the Bluff City electric railway five months more in which to lay its track. The company's franchise would have expired on February 7th had it not been for the extension.

Receiver MacAllister has now been in charge of the Metropolitan Elevated road of Chicago for over a year, and his report shows that from January 20, 1897, to February 1, 1898, the gross income was $953,624 and the total disbursements $723,432, leaving a cash balance of $230,192. The report also shows that before the Metropolitan could use the Union Loop the average daily passenger traffic was about 40,000, while now it is about 64,000.

The bill for the amendment of the charter of the Capital Railway company of Washington has been reported back with the further amendments for the use of a double overhead trolley system on the Navy Yard bridge and that, within one year after the passage of the act, the lines west of the Navy Yard bridge must be installed with an underground electric system similar to that now in use by the Metropolitan railroad, and any portion not so equipped may be forfeited at the expiration of the time named.

By the terms of ordinances passed by the Cicero Town Board last Saturday, Cicero will soon boast of an elevated road and five-cent fare to Chicago's business center. The ordinances are known as the Cicero and Harlem and Cicero and Proviso extension ordinances. The first gives the newly incorporated company the right to build an elevated railway from Fifty-second to Harlem avenue on Lake street and South boulevard, and provides that passengers may be carried to any point on the Union Loop for a five-cent fare. The second gives the Cicero and Proviso railway an extension of its franchise for 50 years and provides for a commutation rate to the city of 12 rides for $1. The elevated road, according to the ordinance, must be completed by July 15th, while the other ordinance does not take effect until the Lake street road is completed.

The great snowstorm of January 31st which raged over New England has proved that a railroad can be operated by the third-rail electric system under the most adverse conditions. That portion of the New York, New Haven and Hartford railroad between New Britain and Hartford operated by electricity, was kept open during the whole of that day and the trains were run with but few seconds' delay in the schedule; while the steam trains on the main lines were delayed for three or four hours. A heavy snowstorm had long been desired by the electrical engineers and railroad officials in order that as severe a test as possible might be applied to the third-rail system. It has been a question, whether, with the third rail practically surrounded by snow and moisture, current would be obtainable in sufficient quantity to furnish the necessary power to operate the cars. This question was settled satisfactorily by the snowstorm.

It is said that Tom L. Johnson has parted with his Big Consolidated Street Railway stock. When the Big Consolidated was organized Mr. Johnson's holdings amounted to $1,500,000. He was one of the organizers of the road, the official name of which is the Cleveland Electric Railway. Johnson has been selling off stock ever since the fall election. About two months ago he began selling his holdings in large blocks, and since then has sold 8,000 shares. He had no broker, but sold the stock direct to the investors. About 10 days ago Johnson sold a block of 1,000 shares to one of the present directors of the company. This transaction became known, and a prominent banker, thinking the stock was low, called on Johnson and discovered that he had in the neighborhood of 3,000 shares left. The banker bought the stock at what he considers a low figure. Mr. Johnson is also said to be withdrawing from the Johnson Electric company of Cleveland and Lorain, Ohio.

The Lake Street Elevated Railroad company of Chicago has accepted the ordinances passed by the Cicero town board, and work on the Lake Street Elevated extension will be pushed forward and will be completed by July 15th of the current year. The extension ordinance for the Lake Street company was granted to the Cicero and Harlem company in order to avoid any entanglements with the Lake Street Elevated litigation. The Lake Street Elevated will be continued one mile west to Taylor street. From that point the track will incline about 1,400 feet until the surface is reached. The surface extension will run to Harlem avenue, making a total extension of 2½ miles, over which a single fare of five cents will be charged to the city. The train service will, of course, be continuous. The regular elevated coaches will be run over the surface line by means of an overhead trolley system and he operated on the third-rail plan when the elevated structure is reached.

Judge Wickes of Baltimore has signed a decree for the sale of the Columbia and Maryland railroad, the proposed electric railway between Baltimore and Washington. The road has been in the courts under various forms of litigation for some time. Messrs. Widener and Elkins and others of the traction syndicate were at one time interested in it. Nicholas Bond is to be continued as receiver. William L. Marbury, as trustee under the first and second mortgages, will conduct the sale. The properties included are controlling interests in the Belt Railroad and Soldiers' Home railway, both of Washington; the Maryland and Washington railroad, stock and bonds of the Catonsville short-line steam railroad, power houses, etc. It is said that the Baltimore Security and Trading company has liens on the properties to the extent of over $2,000,000. The road is completed from Washington to Laurel. A company of New York, Philadelphia and Baltimore capitalists will, it is understood, be formed to buy the several lines and organize a new company.

Referring to the recently published statement that the Chicago, Milwaukee and St. Paul Railroad company has decided to operate its suburban trains in and about Chicago by electrical power, the Railroad Gazette has this to say: "As a matter of fact, the St. Paul has for a good while been making careful investigation into this matter with a view to 'electrifying' the Evanston division. According to the plan this will be worked in connection with the Northwestern elevated, and thus the suburban trains of the St. Paul will be brought directly into the heart of the city over the Union Loop. Such an arrangement would be an extraordinary and we should suppose popular and successful arrangement

for handling suburban traffic. Indeed, it would be the nearest to the ideal arrangement of anything that has yet been installed. We believe it to be quite true that this is likely to be carried out, but inasmuch as the Northwestern elevated cannot be finished for something like a year, and inasmuch as the money for finishing that road does not seem to have yet been provided, the complete working out of this scheme may be delayed some little time."

Articles have been filed for the organization of the LaGrange, Warrenville and Fox River Electric Railroad company. It is proposed to construct and operate an electric railroad from LaGrange Park in Cook County, Ill., westerly through Fullersburg and Warrenville, in DuPage County, to Fox River in Kane County, with branches to Proviso, Center and Western Springs, in Cook County, and to Hinsdale, Lombard, Downer's Grove, Glen Ellyn, Naperville, Wheaton, Bloomingdale, Roselle and West Chicago, in DuPage County, and to Batavia, in Kane County, and branches from the main line to other points between the DesPlaines River in Cook County and the Fox River in Kane County. The capital stock is placed at $100,000, and the principal office is to be maintained at Chicago. The incorporators and first board of directors are George W. Waite, A. C. Allen, M. C. Covell, A. H. Kenman, Frederick Poulsen, J. W. Krueger and Edward S. Ely, all of LaGrange; James M. Vallette, B. B. Boreker, I. N. Murray, Willard Scott, George Remps, C. L. Schwartz of Naperville, William J. Manning, John McKee, A. T. Jones of Warrenville, Henry W. Grote, J. J. Cole, Ira Brown, Elbert H. Gary and George W. Brown of Wheaton, George W. Wilson of Hinsdale and J. M. Vallette of Naperville.

The Supreme Court of Connecticut has decided that the appeal of the New York, New Haven and Hartford Railroad company from the decision of Judge Wheeler of the Superior Court in the matter of the building of the Shelton electric railway cannot be allowed. The work will now be pushed forward as rapidly as possible, and before the summer is over Bridgeport and Ansonia and other towns up the Naugatuck Valley will be connected by trolley lines. This attempt to parallel the system of the Consolidated road has led to much litigation, and the case has twice been in the Supreme Court. On the first hearing the Consolidated road secured a victory. Judge George W. Wheeler laid down the principle that a road which desired to build must show its financial ability to do so. The Supreme Court sustained this opinion. The matter then came up again before Judge Wheeler, and the street-railway company showed to the judge's satisfaction that it was in good financial condition and able to build the proposed extension. The attorneys for the Consolidated road gave notice of an appeal, asserting that Judge Wheeler had not found in accordance with the decision rendered by the Supreme Court on the previous hearing. The steam railroad is beaten on a technical point in taking the appeal. Counsel for the street railway filed a plea of abatement against the jurisdiction of the court, saying that the appeal is fatally defective because it failed to give the term to which the appeal was taken and the time of the meeting mentioned. Two decisions of the Supreme Court of recent date were quoted to sustain this view.

TELEPHONE.

The Citizens' Telephone company is being organized to establish a system at Columbia, Tenn.

The Macon (Mo.) Telephone company has been incorporated by H. L. Gray, J. A. Hudson and Theo. Gray. The capital stock is $10,000.

It is asserted that the Bell Telephone company will appeal to the courts unless North Carolina's State Railroad Commission restores the old rates.

Franchise for a telephone system has been secured by J. A. Helvin, at Charlotte, N. C., and it is probable that the construction of the plant will be commenced soon.

The Western Maryland Telephone company of Westminster, Md., will issue bonds for $8,000 to provide funds for extending its telephone lines to Baltimore; John M. Reifsnider is the secretary.

The Haskell and Throckmorton Telegraph and Telephone company has filed its charter, the capital stock being $3,000. The purpose is to construct and maintain telegraph and telephone line between Seymour and Haskell, Texas. The incorporators are T. H. C. Peery, G. P. Barber and G. S. Plants.

The Union Telephone company has been organized in Portland, Me., for the purpose of acquiring and operating telephone lines and dealing in telephone and electrical supplies. The papers of incorporation call for a $10,000,000 capital stock, of which $300,000 is paid in. The officers are: President, Frederick H. Gorman of New York; treasurer, George A. Beaton of Detroit.

ELECTRICAL SECURITIES.

On Monday Chicago Telephone stock sold up to 204, the highest price attained in several months.

Chicago Edison five per cent. gold bonds touched 106½ last week. This is the highest price noted. The business of the company is in a very satisfactory condition.

The Columbus Street Railroad company reports gross earnings for January of $53,788, an increase of $6,919 as compared with the same month of last year, and net $28,598, an increase of $5,501.

The complete returns of the Erie Telegraph and Telephone company for the year ended December 31st show gross earnings of $364,550, an increase of $49,636; expenses and interest, $137,903, an increase of $31,629, and an improvement of $18,007 over the preceding year.

Probably the increased cost of operating the Third avenue system in New York has compelled that corporation to consider electrical equipment. The gross earnings last quarter increased $36,170, but the operating expenses also increased $41,298 compared with the previous year.

The detailed statements of the Brooklyn street-railway companies for the last quarter of last year showed marked improvement. The Brooklyn Heights company's net earnings, as compared with the same period in 1896, showed an increase of $19,721, while the Brooklyn, Queens County and Suburban company's receipts were $23,371 ahead of last year's report for the same quarter.

The Bridgeport Traction company reports gross earnings for January of $26,898, an increase of $4,292 as compared with the same month of last year, and net $11,246, an increase of $3,795. For the seven months ended January 31st, the gross earnings were $200,403, an increase of $6,753 as compared with the corresponding period of last year, and net $96,719, an increase of $15,837.

First-mortgage five per cent. 50-year gold bonds of the Syracuse Rapid Transit Railway company to the amount of $1,250,000 are offered for sale at 101 and interest. The net earnings of the road for the six months ended December 31st were nearly $120,000. The reports of special experts who were engaged to make an examination of the property are particularly favorable. The company owns franchises which practically give it a perpetual monopoly of the street-railroad business in Syracuse.

MISCELLANEOUS.

There is a bill pending in the United States Senate providing that all overhead electric wires in the District of Columbia, within the fire limits, be removed within one year from the passage of the act.

Commenting on the recent storm in New England, during which a large number of horses are reported to have been killed in the streets of Boston by contact with fallen trolley wires, the London Electrical Engineer regrets the "holocaust of over 200 horses."

It is reported that a large power house will be erected in or near Kansas City for the generation of electricity to be distributed for use in packing houses, factories, on street railways and otherwise. Those said to be interested include Colonel D. A. McKibben, John M. Lang and G. W. Kierstead, all of Leavenworth, Texas.

The Acetylene Gas Machine company has plants on both sides of the river at Niagara Falls. It finds business good in its New York state branch, but on the Canadian side a peculiar restriction imposed by the Canadian fire underwriters, that two generators be attached to each machine sold in Canada, raises the cost of a plant to such a price that the sale is greatly restricted.

A bill has been introduced in the Virginia Legislature for the protection of electric lighting and power companies from theft of electric current or apparatus, or unlawful interference therewith. The measure provides that anyone intentionally preventing an electric meter from properly registering, or diverting any electric current from the wire of any company, or who shall unlawfully injure any apparatus of such company, shall be guilty of a misdemeanor and be punished by a fine of not less than $50 nor more than $200, or by confinement in jail for not more than one year, or both.

On March 3d Major Leach, the United States engineer at New London, Conn., will open bids for installing an electric light and power station at Great Gull Island, N. Y. The engine is to be a 28 horse power oil engine of the Hornsby-Akroyd type, with accessories. The generator is to be a multipolar, 15-kilowatt, direct-current, constant-potential, compound-wound, belt-connected, 250-volt dynamo. Three switchboards are required. The conductors are to be insulated according to United States navy specifications. Two storage batteries are required, each to consist of 54 chloride accumulator cells. Intending bidders desiring further particulars can obtain them upon application to Major Leach.

Mr. Edison, who developed the kinetoscope, is said to be after all the promoters of machines of the "scope" and "graph" order who do not pay tribute to him or give him credit. He declares many of them are unlawfully using the fruits of his genius. Through his counsel damage suits for patent infringement have been instituted and active preparations are under way for broadening the campaign. One of the first moves made by Mr. Edison was to begin action against the managers of a passion-play representation now running in New York. One of the mangers made a visit to Mr. Edison, and when he returned said he had agreed to pay the inventor a royalty. Mr. Edison's name will appear on the programme in token of his triumph and in warning to his opponents. It is said that the inventor's next move will be against a passion-play production in Baltimore.

TRADE NEWS.

W. W. McChesney, Jr., representing the well-known firm of Huebel & Manger of Brooklyn, passed through Chicago on a trip through the central states. Mr. McChesney has met with flattering success so far, having secured many orders for the widely-known products of his company.

The Mason Electric Equipment company, 408 Fisher building, Chicago, has secured the entire order for the overhead equipment, including trolley wire, span wire, etc., for the St. Louis, Belleville and Suburban Railway company. This contract is an important one, and the Mason company is to be congratulated on securing it.

The Davis & Egan Machine Tool company of Cincinnati, Ohio, has received through its office at Berlin, Germany, orders for a number of its screw machines, lathes, drill presses and shapers, from the Electricitaets Gesellschaft Helios of Cologne and Schuckert & Co. of Nuremburg. Both of these concerns are large builders of electrical equipments.

The plant and business of the St. Louis Electric Light and Power company have been transferred to the Missouri Edison Electric company. C. E. Delafield has moved his office to the latter company's headquarters in the American Central building, 415 Locust street, where he will personally give attention to complaints in connection with the service and look after orders for motors and power service.

The Bissell, Dodge & Erner company of Toledo, Ohio, has for three years maintained a branch office at Columbus, Ohio, where the business has assumed proportions that make it desirable to run it as a separate concern. For this purpose Mr. John A. Erner has sold his interests in Toledo and purchased the Columbus business entire. Little change will be made in either place except the names, which will be F. Bissell & Co., Toledo, and J. A. Erner & Co., Columbus. The affairs of the Bissell, Dodge & Erner company will be closed at the Toledo office.

BUSINESS.

The Central Electric company of Chicago is prepared to furnish from stock India or amber mica, cut or uncut, in rings, washers, or any other standard form, a specialty being made of standard shapes for commutators.

The General Incandescent Arc Light company of New York states that the firm of S. R. Jonap & Co. of that city, having tried a number of enclosed arc lamps made by a competitor, has replaced them by standard Bergmann enclosed arc lamps.

James L. Robertson & Sons, 204 Fulton street, New York, manufacturers of the improved Robertson-Thompson indicator for steam engines, announce that, owing to a greatly increased demand for high-grade indicator piping, they have recently added to their equipment excellent facilities for this work.

Eugene Munsell & Co. of New York and Chicago, importers and dealers in amber mica, report a gratifying demand for all their insulating specialties. The India mica is being used very largely by electrical manufacturers and street-railway companies, both in this country and in Europe, on account of its being free from iron as well as its high insulating qualities.

The Ward Leonard Electric company's new catalogue of iron outlet boxes is comprehensive and valuable. The arrangement is good, and the illustrations are clear and helpful. The company, which installed over 80,000 boxes in New York city last year, is addressed at Bronxville, N. Y. The western representatives are Meysenburg & Badt, 1504 Monadnock block, Chicago.

The Boston Gas Light company is erecting a new gas-plant at Commercial Point, in the vicinity of Boston. This new plant consists of a building about 52 feet wide and 185 feet long, having brick side walls and brick partition walls. The floors are of steel throughout. The roof is covered with slate supported on steel roof trusses and framing. The contract for furnishing and erecting the steel roof work complete has been let to the Berlin Iron Bridge company of East Berlin, Conn.

In addition to Crescent telephones, the Pennsylvania Electric company of Marietta, Pa., manufactures what it claims to be "a thoroughly reliable automatic electric temperature regulator." This regulator embraces a thermostadt in conjunction with an electric automatic valve controller for radiators and an electric automatic damper controller for drafts and dampers which can be furnished, it is said, at a much lower cost than any apparatus now on the

market used for a similar purpose. Correspondence is solicited.

The Lynn Incandescent Lamp company of 685 Washington street, Lynn, Mass., makes a specialty of renewing burned-out lamps. It also buys old lamps outright. "Our renewed lamps," the company says, "are just as long-lived and generally satisfactory as new ones. We replace the filament with a new one in exactly the same manner as in making a new lamp. We clean the bulb and use the same care as regards uniformity of voltage, candle power and current consumption as in making our new lamps." A "renewal circular" is sent to those desiring information.

The Standard Light and Power company of Dallas, Texas, has placed an order with the Walker company for two alternators, one of 225 and the other of 325 kilowatt capacity. They are to be direct-connected to Erie engines and are designed to run at 125 revolutions per minute. The current will be two-phase and 60 cycles. In addition to these the Walker company will furnish two direct-connected railway generators of 225 and 325 kilowatt capacity respectively. Two alternating generators of 250 kilowatt capacity each are being built for the North River Electric Light and Power company of New York city. They are to be of the belted type. Townsend, Reed & Co. of St. Louis have purchased for the St. Louis, Belleville and Suburban Electric Railway company two 200-kilowatt direct-connected Walker railway generators, besides eight double to "S" railway equipments with "S" controllers. On the other side of the Atlantic the Glasgow municipal tramway will place a number of Walker motors on its cars at an early date, while the electric railway of Alexandria, Egypt, will increase its present Walker plant by the addition of one 150-kilowatt belted generator with switchboard and four double three "N" equipments.

The extensive application of chloride accumulators manufactured by the Electric Storage Battery company is indicated by the large business of the company. The latest contracts cover batteries to be used in connection with electric elevators in the 30-story office building being erected on Park Row, New York, where 58 chloride accumulators of 1,500 ampere-hour capacity will be installed; for the Cushman building, New York, 118 320 ampere-hour cells; the Dun building, New York, 114 1,100 ampere-hour cells. The State Mutual Life Insurance company, of Worcester, Mass., has contracted for an increase in its original plant. Very large plants are being constructed for the Chicago Edison company and the Buffalo Railway company. Chloride accumulators are being installed in the residences of Mr. John I. Waterbury, Morristown, N. J., and Mr. G. P. Morosini, Riverdale, New York; also in Mr. Howard Gould's new steam yacht Niagara and Mr. Lloyd Phœnix's yacht Intrepid. The American Fire Insurance company's building in Philadelphia is being equipped with a battery for night lighting. The Germantown, Pa., Hospital, which has operated a battery of chloride accumulators for about two years, is increasing the capacity of its plant by 50 per cent. Cells, ranging in capacity from 400 ampere-hours to 1,200 ampere-hours, have been furnished to the Cleveland Telephone company and the Southern Bell Telephone company; 1,300 cells have also been supplied for fire-alarm work at Portland, Ore., Augusta, Ga., and St. Paul, Minn. For telegraph work the Lehigh Valley Railroad company has ordered 208 cells, the Southern Pipe Line company 50 cells, the Great Northwestern Telegraph company 265 cells, the Chicago, Milwaukee and St. Paul Railway company 276 cells, and the Postal Telegraph-cable company 220 cells. The General Electric company has contracted for 112 cells of from 160 to 200 ampere-hours' capacity; the Patton Motor company and the National Electric Car Lighting company are installing 432 cells in connection with their systems, and the State School of Mines, Colorado, has equipped its laboratory with 52 cells of 160 ampere-hours' capacity.

ILLUSTRATED ELECTRICAL PATENT RECORD.

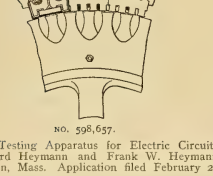
Issued February 8, 1898.

598,498. Junction Box for Electric Conductors. Thomas J. Close, Philadelphia, Pa. Application filed May 26, 1897.

This device consists of a body portion having openings in its sides and provided with a flanged rim having openings therein, a lid with a bail and provided with openings registering with the flange openings and a gasket between the flange and lid, the lid and flange having an interlocking ridge and groove joint.

598,508. Automatic Electric Fire Alarm. William A. Guthrie, Durham, N. C. Application filed July 7, 1897.

Claim is made for a combination push-button and automatic electric fire-alarm comprising the base adapted to be secured to the ceiling or other overhead support, a pair of plates and binding-screws on the under face thereof, one of the plates having a downwardly-curved extension normally in contact with the other, a push-button of easily fusible metal below the curved extension, and a wire passed through openings in the curved extension and the button and having bent ends, whereby the button is suspended from the curved extension and holds it out of contact with the other plate.



NO. 598,657.

598,517. Testing Apparatus for Electric Circuits. Edward Heymann and Frank W. Heymann, Boston, Mass. Application filed February 26, 1897.

This instrument comprises a plurality of line terminals, to which the circuits to be tested are connected, an auxiliary circuit provided with terminals co-operating with the line terminals, movable circuit-controllers co-operating with the line terminals and with the terminals of the auxiliary circuit, means to impart to the circuit-controllers different rates of movement, and an electro-magnet in the auxiliary circuit governing the operation of the means.

598,540. Construction of Dynamo-electric Machinery. Alfred Soames, London, England. Application filed December 6, 1897.

A dynamo-electric machine in which an assemblage of sheet-metal rings and the bearings for the armature shaft are secured to the frame concentrically one with the other by type metal or other suitable material cast between them and the frame.

598,553 Electric Switch. Johan M. Andersen, Boston, Mass. Application filed December 5, 1896.

This device includes a stationary member composed of a base piece and side arms integral therewith and extended at an angle thereto, a movable member composed of a back piece and side arms integral therewith and extended at an angle thereto and adapted to make a sliding contact with the arms of the stationary member, an actuating lever for the movable member pivoted with a socket, and a spring located in the socket and acting on the movable member.

598,556. Primary Battery Cell. Fred H. Brown, Chicago, Ill. Application filed December 9, 1895. Renewed January 12, 1898.

The negative element is composed of an agglomerate of black oxide of manganese and plumbago, having a superimposed layer of carbon and a sealing cap of insulating material, and a conductor arranged therein and chloride of silver introduced in the agglomerate adjacent to the conductor, and a positive element arranged adjacent to the conductor.

598,568. Method of Manufacturing Rheostats. Electric Heaters. Harry W. Leonard, New York, N. Y. Application filed April 9, 1897. Divided and this application filed January 3, 1898.

The method of arranging the resistance of a rheostat into steps consists in making the ohms of each step practically proportionate inversely to the square of the current through the step when it is subjected to its maximum duty, so that the current squared times the resistance under maximum conditions will be practically constant per square inch for each step.

598,580. Trolley Head. Herbert W. Smith, Somerville, Mass. Application filed June 10, 1897.

The claim is given: The combination with a trolley head having a handle enlargement, a groove in said enlargement, of an endless ring closed into said groove so as to inclose the coil-box, a part of the circumference thereof, the remainder of said ring being bent outward to form an eye for the attachment of a trolley rope.

598,610. Coin-controlled Telephone Pay Station. William Gray, Hartford, Conn. Application filed December 4, 1895.

One feature is a coil-box having a metallic base, a transmitter mounted on the coil-box, a toll-box secured to the metallic base of the coil-box, a toll-coin-controlled device located within the box and mounted on the wall thereof.

598,638. Electric Heater. James F. McElroy, Albany, N. Y. Application filed March 24, 1894.

This heater consists of end pieces, each provided with a chair, a tube fastened in the end pieces, supply and return conductors arranged within the tubes, plates adapted to rest in the chairs, a spindle connected with the plates, a coiled resistance on the spindle, the resistance-carrying spindle placed intermediate of the tubes, and a series of rods passing from one end piece to the other.

598,640. Electric Heater. James F. McElroy, Albany, N. Y. Application filed April 6, 1895. Divided and this application filed August 6, 1897.

Two overlapping plates are adapted to slide relative to each other, and are provided with insulating edges; means are also provided for connecting the plates together, and springs are arranged between the plates tending to force them apart, while a resistance wire is wound around the plates.

598,655. Coin-controlled Machine for Automatically Distributing Electric Currents. John W. Dawson, Louisville, Ky. Application filed November 18, 1895.

The mechanism described comprises movable electrodes and a pair of batteries, a battery-changing device connected to and operated by the electrode, whereby the batteries are alternately thrown into and out of circuit.

598,657. Alternating-current Dynamo. William B. Esson, London, England. Application filed April 21, 1896. Patented in England March 25, 1895.

An armature composed of detachable core-sections, each provided with slot-tunnels or passages, and a coil extending through the tunnels and embedded in the core-section is the principal feature.

598,679. Means for Use in Operating Electrical Switches. Thomas H. Parker, Tettenhall, England. Application filed December 9, 1897.

In apparatus for use in operating successively two or more electrical switches or sets of switches there is the combination of two or more rollers or disks having notches or gaps therein and studs which project therefrom, means for rotating such disks, intermediate levers or arms, each mounted upon a fixed pivot axis and having a bifurcated end for engagement with a stud which is carried by a disk, and a shoulder which is at somewhat greater distance from the pivot axis of the lever than the distance from such axis to the nearest point of each corresponding roller or disk, and means by which each lever operates a switch or set of switches as it is moved by its corresponding disk.

598,697. Electric Arc Lamp. Sidney I. Crain, Cincinnati, O. Application filed July 24, 1897.

A pair of pivoted arms carries rollers adapted to engage with the carbon-rods at or near the point of support, and electrical connection is made between the rollers and the main.

598,715. Automatic Electric Switch. Frank C. Perkins and John D. Killip, Buffalo, N. Y. Application filed September 25, 1897.

In an automatic electric switch, the combination with a base having a contact, of a switch-lever arranged to swing at right angles to the base and provided on its inner side with a catch extending toward the base, a locking-lever pivoted to swing parallel with the base interlocking normally with the catch and provided with a pointer, a scale mounted on the base and traversed by the pointer, an expansible thermal rod or wire included in the circuit and controlling the locking-lever, and automatic means for opening the switch-lever when released.

598,726. Incandescent Electric Lamp and Process of Making Same. John C. Fish, Shelby, O. Application filed August 3, 1897.

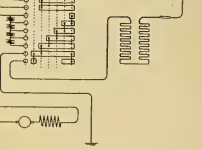
The following steps in the manufacture of an incandescent electric lamp are described: Taking a tube having a flange on its end, fusing to the side of the flange which is opposite the tube a mount, the flange being substantially flat or in the form of a disk, whereby the fusing flange may conveniently be brought against the side thereof opposite the tube, and fusing the flange to the base of the lamp globe.

598,731. Electric Railway. Martin T. A. Kubierschky, Berlin, Germany. Application filed March 26, 1897. Patented in Germany January 1, 1896; in Belgium November 28, 1896; in France November 28, 1896.

One claim is for the combination of a motor for propelling the car, electric heaters, a controller cylinder provided with contacts for regulating the energy supplied to the motor, contacts on the cylinder for including a heater in circuit at the time the motor circuit is interrupted, contacts for re-establishing the heater circuit when the controller cylinder has been moved to a high-speed position, and a cut-out switch for the heater.

598,733. Safety Cut-out for Electric Lamps. Alfred N. Lovelace, Knoxville, Tenn. Application filed June 12, 1897.

A fuse-box is provided at opposite side edges with inturned retaining flanges and with a central longitudinal partition strip, a pair of aligned contact springs arranged at each side of the partition strip and having curved free ends normally projected beyond the edge thereof, a removable lid slidably engaging beneath the flanges, and separate pairs of aligned contact plates fitted to the inner side of the lid and connected by short fuse wires, the contact plates being engaged by the curved free ends of the springs which exert a pressure thereagainst.



NO. 598,731.

598,853. Electric Call-box System. William T. Budds, Charleston, S. C. Application filed August 23, 1897.

A call-box system is described, comprising a main wire, call-boxes having a shunt connection with the main wire, and also having a ground connection, a battery with one pole of which one end of the main wire connects, a wire leading from the other pole of the battery, a switch for connecting the last-named wire with a ground wire, a switch for connecting the last-named wire with the main wire, the first-named switch also operating to connect the ground wire with an intermediate element of the battery, and a sounding device in each extremity of the main wire.

598,894. Electric Time Switch. George F. Goodwyn, Arthur, Canada. Application filed April 26, 1897.

The claim is made in an electrical time-switch for the combination with a base, contact plates secured to the base, and a switch-lever pivoted to and insulated from the base, of a clock, a bracket secured to the clock, a screw through the bracket to support and adjust the switch-base, means for guiding the switch-base during its adjustment, and means connected with the works of the clock to press the switch-lever against the contact plates and to release the same at predetermined times.

Western Electrician.

EVERY SATURDAY.

Vol. XXII. CHICAGO, FEBRUARY 26, 1898. No. 9

Independent Telephone Movement.

The development of the independent telephone movement has been one of the surprises of the century, even to those who have been its most ardent advocates. It can be said that the commercial world has rarely if ever witnessed a similar expansion of an industry in such a short time as that which marked the introduction of the telephone since the field was opened to independent companies by the expiration of the fundamental Bell patents. And yet all indications point to an even greater development. This is only the beginning. The people of the country are just awakening to a realization of the fact, it would seem, that what was for many years a luxury within the means of comparatively few is to-day not only a possibility but a necessity. Hence the popularity of the independent movement with the mass of the people.

It will be appreciated that such a project could be successfully conducted only by the active, persistent and united efforts of an intelligent and enthusiastic body of men. These requisites, it will be admitted, are possessed in a high degree by the leaders of the independent telephone movement. They have succeeded in creating a new industry, for that is really what the present movement amounts to, developing suitable apparatus and establishing high standards of construction, equipment and operation that compare favorably with Bell methods. Some facts about the men who have been instrumental in bringing this about will prove interesting at this time.

JAMES F. KEELYN

One of the most prominent figures in the independent telephone movement since its inception has been James F. Keelyn, president of the Western Telephone Construction company of Chicago. Mr Keelyn is a native of Albany, N. Y., and is still a young man. For 20 years he has lived in the West, and much of that time in Chicago. He is familiar with the Bell policy and methods through long service with that company. Mr. Keelyn entered the Wisconsin Telephone company's service when it was formed and was manager of the Racine exchange from 1880 to 1882. Anticipating the expiration of valuable patents held by the Bell people, he began preparations for work for the telephone business and in 1886 formed the Western Telephone Construction company of Chicago. He has since been closely identified with the independent telephone business and is one of the most aggressive factors in the movement.

W. A. BISLAND

Another pioneer in the independent movement is W. A. Bisland, the vice-president of the Western Telephone Construction company. Mr. Bisland joined the movement a few months after the formation of the Western Telephone Construction company, and he has been identified with it ever since. He is an experienced business man and he had been identified with the technical department. His career before entering the telephone field was largely in New York. He was for 15 years on Wall street and in that time came to know the value of an enterprise, he says. His decision to take up the telephone business as an anti-Bell man was reached after careful consideration, and has, he believes, proved the wisest conclusion he has ever reached.

H. C. DODGE.

Harry C. Dodge, the general manager of the American Electric Telephone company of Chicago, has been identified with the development of telephone and electric-lighting enterprises, power transmission and general electrical construction work since 1883. A considerable portion of that period was spent in the telephone field, especially in the management of exchanges and toll-line systems controlled by the Wisconsin and Central Union Telephone companies. Mr. Dodge's early experience in the independent movement was acquired as promoter and organizer of sub-companies for the Western Telephone Construction company. He was one of the organizers and incorporators and the general manager of the Northwestern Telephone and Electric company, and he was the original promoter and one of the incorporators of the Standard Telephone and Electric company of Madison, acting as chief electrician and general superintendent of the latter company from the date of its incorporation until he resigned one year ago to become associated with F. C. Burns of the American Electric Telephone company as general manager. In his new capacity Mr. Dodge has added to his list of friends and has increased his reputation for executive ability.

3. Paul W. Jessup. 4. A. Stromberg
5. A. Carlson. 6. H. C. Dodge.

INDEPENDENT TELEPHONE MOVEMENT.

MESSRS. STROMBERG AND CARLSON

Any history of the telephone business, independent or Bell, would be incomplete without mention of the part taken in the development of the industry by Messrs. Stromberg and Carlson of Chicago, whose work is particularly appreciated throughout the West.

A. Stromberg was born in 1861, just outside of the city of Stockholm, of a family of mechanics. His boyhood days were spent in the shops of his father, who was a manufacturer of grain threshers, but he was not content with that line and, at the age of 15, went to Stockholm and started in the mechanical department of Eller & Co., the oldest electrical company of that country. Late in the seventies he worked with a construction company, putting up telegraph lines between the larger cities. The year following he put up some of the first magneto telephones that were used in that country. Early in 1879, when the company received the first pair of battery transmitters introduced there, he assisted in the test. Mr. Stromberg engaged with the Bell company when it put in an exchange at Stockholm and others throughout the Northern Peninsula and Denmark. Towards the latter part of 1883 he came to this country. His first experience in the United States was gained in Pennsylvania, where he was engaged in building exchanges for the Bell company. He started with the Chicago Telephone company in 1888. He remained in the instrument department about two years, during which time he invented many new devices, some of which are still being used by the Bell company. He next took up outside construction and then the burglar-alarm department as electrician. In 1890, when the Chicago Electric Protection company was organized to compete for the burglar protection business in Chicago, it placed Mr. Stromberg at the head of the electrical department. The company's principal patents were on his inventions.

A. Carlson was born in the autumn of 1854, in the southern part of Sweden, not far from the town of Borsa. He developed a taste for mechanical work early, and was continually making new devices for play or usefulness, preferring work that called for the exercise of his judgment, skill and ingenuity at every step of its progress. He came to this country early in the 70's, and after spending some time in different parts of the country eventually settled in Chicago. For several years he was engaged in electrical, mechanical and construction work, and finally entered the telephone field with the Chicago Telephone company in the mechanical department. He remained with the company until the independent field was opened.

Messrs. Stromberg and Carlson experimented on magneto transmitters, and by the time the fundamental Bell patents expired had their magneto telephone completed and fully covered by patents. Early in January, 1894, they resigned their respective positions, to take effect on the first of that month, the day the independent telephone business was opened, and they concluded arrangements for the manufacture of their apparatus with the Western Telephone Construction company. This magneto apparatus is well known and many of the instruments are in successful operation to-day. When the battery-transmitter business was opening, they determined to engage in that branch, and on May 10, 1895, the corporation bearing their name was organized. Both Messrs. Stromberg and Carlson, while not born in this country, renounced all foreign allegi-

ance and became thoroughly Americanized citizens as early as the laws permitted.

Besides equipments for public-exchange work and private intercommunicating plants, they have perfected police and fire-alarm and street-railway systems. They claim that the next few years will unveil wonders in practical telephony.

J. J. Nate.

Among telephone men of experience it seems unnecessary to speak of the record of J. J. Nate, the general manager of the Standard Telephone and Electric company of Madison, Wis. Mr. Nate entered the service of the Bell Telephone company at Chicago with the introduction of the first telephones in the West, in June, 1878, and remained with that company until January 1, 1894. During his connection with the Bell company he gained a thorough knowledge of the business through his appointment from time to time to positions of responsibility and trust in various departments—as operator, foreman, superintendent of equipment, operation and supplies, and more recently as purchasing agent, having filled the latter position for over 10 years. Improvements in the apparatus manufactured for the Chicago Telephone company were largely due to the efforts of Mr. Nate and his associates, who, as practical experts, co-operating with the Western Electric company, suggested, tested and approved much of the apparatus in use by the Bell company to-day. As early as 1879, Mr. Nate became interested in the development of switchboards and telephone apparatus, having successfully superintended the installation of the switchboards used in Chicago, and made necessary in the earlier years by the rapid growth of the business and inefficiency of the apparatus then manufactured. It is needless to say that this experience has proven of value to the company with which he is now connected.

Paul W. Bossart.

Paul W. Bossart is entitled to the distinction of being one of the prominent pioneers in the telephone business. As early as 1879, in company with General O. E. Madden, whose title then was superintendent of agencies of the National Bell Telephone company, he organized a telephone exchange company in Kansas City, Mo. Mr. Bossart was appointed superintendent. This was the second Bell exchange to start in the West, Cincinnati being first, St. Louis and Omaha following soon after. St. Joseph, Joplin, Carthage, Springfield, Mo., were added to the list, and the entire state of Kansas soon had exchanges in all its principal cities. These were constructed under the personal supervision of Mr. Bossart, and remained under his management for a number of years. It may be mentioned incidentally that his career as an expert telegrapher tended in a great measure to fit him for the work. After filling the position of general superintendent of the United Telephone company, which was made up by the consolidation of all the exchanges in Kansas and southwestern Missouri, he was transferred to the New England Telephone company as superintendent, a place he resigned for a position in Edison's laboratory, where he assisted in developing the phonoplex system of telegraphy. Mr. Bossart re-entered the telephone field in 1894 and has been prominently identified with the independent telephone movement constantly since that time. His familiarity with every detail of the business fits him in a high degree for the responsible position of manager of the Pennsylvania Electric company.

Messrs. Doolittle and Cook.

A recent acquisition to the independent telephone forces of considerable importance is the Sterling Electric company of Chicago.

W. E. Doolittle is the general manager of the company. He was born at Lafayette, Ind., and at an early age began to shift for himself. First as a messenger boy for the Western Union Telegraph company then an operator at the age of 15, and after service of seven years with the Western Union company, becoming manager for the Baltimore and Ohio Telegraph company. Upon the consolidation of the Baltimore and Ohio with the Western Union Mr. Doolittle entered the service of the Postal Telegraph company and the Central Union Telephone company at the same point as manager. Upon the advent of the independent telephone movement Mr. Doolittle was one of the first to encourage it, as he recognized in it the opening of a broader field for operations. Mr. Doolittle severed his connections with the old concerns to accept the general management of the Lafayette Harrison Telephone company, which he developed from an experimental system to one of the largest and most successful independent exchanges in the field. On February 1st he came to Chicago to assume the management of the Sterling Electric company.

F. B. Cook, chief engineer of the Sterling Electric company, was born in Monroe, Mich., removing to Toledo, Ohio, while young. Early in life Mr. Cook developed an aptitude for mechanical and electrical work, entering the [illegible] of the first Bell Telephone company [illegible] and having charge of the construction of the system. He has worked in several Bell sub-companies for 10 years. Soon the mechanical and electrical genius developed in Mr. Cook was recognized by the Bell company and it pushed him rapidly forward to the office of chief engineer of the Central Union property. This position he held for 11 years prior to 1897. While in the Bell company's service Mr. Cook invented and patented devices perfecting and improving the central-office equipment and instruments of that company. He retained an interest in the greater part of these patents. In 1896 Mr. Cook severed his connection with the Central Union company, as he recognized that the independent telephone field offered larger and more promising opportunity.

Charles W. Farr.

Few men are better and more favorably known in the telephone business than Charles W. Farr, president of the Farr Telephone and Construction Supply company of Chicago, whose portrait is presented herewith. Mr. Farr was born in Port Huron, Mich., in 1849, and early in life took a fancy to telegraphy and telephony. At the age of 22 he became connected with the Western Union Telegraph company, serving for 14 years under District Superintendent E. P. Wright, with headquarters at Cleveland, O. It might be mentioned that for the entire 14 years Mr. Farr did not miss a single day. He was the local manager of the company for 14 years. The three years following he served under I. McMichael, district superintendent of Minneapolis, Minn. He then became local manager of the Michigan Bell Telephone company, with headquarters at Detroit, which position he filled for eight years. During his last year with the Bell company, he served mostly as state inspector, examining most of the exchanges and making himself thoroughly familiar with every phase of telephony. He then came to Chicago, and in February, 1895, formed the Farr Telephone and Construction Supply company. The company is at the present time the only wholesale telephone supply house in the West. The principles which Mr. Farr and his associates have always followed have given the firm an honorable name, and as a consequence the company has and is receiving orders from all over the world. The Farr company manufactures everything in the telephone line—from the smallest part to complete exchanges—and the excellence of its products has given it an enviable reputation. Mr. Farr is an unassuming quiet gentleman and is highly esteemed by all who know him. His untiring efforts have placed the Farr company where it is to-day, and the concern is to be congratulated on having so energetic a man at its head.

Messrs. McFell and McWade.

The McFell Electric company of Chicago was incorporated in 1890. The members of the company are Judson McFell, president and treasurer, and William J. McWade, secretary and general manager. Both were born in Port Dover, Ont. Mr. McFell came to Chicago and entered the service of the Western Electric company in 1881, and it was under his supervision that the first intercommunicating system of telephones was installed in Chicago. He has since installed a number of systems in this and other cities. Mr. McWade resigned a good position with Pullman's Palace Car company in order to become a member of the firm, and has ever since been an active member of the concern. The company has made a record in the last few years which it may justly feel proud of. It has had some of the largest and most complicated contracts in the city, and it now handles a full line of telephone goods. The company's microphone is considered by experts to be a high-class instrument.

2. W. J. McWade. 3. Judson McFell. 1. Frank B. Cook. 4. Charles W. Farr. 5. W. E. Doolittle.

INDEPENDENT TELEPHONE MOVEMENT.

James S. Cuming.

The Central Telephone and Electric company of St. Louis is a copartnership between James S. Cuming and R. T. Durrett, and succeeded the D. A. Kusel Manufacturing company on October 14th.

James S. Cuming, the general manager of the Central Telephone and Electric company, was born in St. Louis, and after passing through the public schools of the city entered the wholesale grocery business as an office boy for the Krafft Holmes Grocer company. At the age of 19 he was offered a position to represent the James M. Houston Grocer company in the territory embracing all towns between St. Louis and Fayetteville, Arkansas, on the Frisco railroad. Mr. Cuming at once met with success as a commercial traveler and continued as such for about four years, in which time he covered the greatest part of the state of Missouri. On June 22, 1895, Mr. Cuming purchased a half interest in the business of the D. A. Kusel Telephone Manufacturing company, and though the profits for his first five months in the telephone business were less than expenses, Mr. Cuming's energy and straightforward, businesslike methods soon won recognition, and by the end of the first year the company was compelled to seek larger quarters in order to take care of the increased demands of its customers, and again

in September, 1897, the company found that it would be necessary to increase its capacity, and moved to the present quarters at 1123 Pine street. The company had by this time built a business which was quite valuable, and Mr. Cuming had no difficulty in finding additional capital for the business. Mr. Durrett confines his entire attention to the financial part of the business, and Mr. Cuming has full control of the firm's business policy. Mr. Cuming has always kept fully posted on the telephone situation and has recently made some very important improvements both in telephones and switchboards, bringing the instruments strictly up to date in every particular. A full description of the switchboard was given in the Western Electrician of January 4th.

On the afternoon of January 7, 1898, a proposition was made to Messrs. Cuming and Durrett to purchase the entire stock and good will of the Missouri Telephone Manufacturing company, a corporation which was established several years previously and which had succeeded in establishing considerable demand for its goods. This addition

3. Henry J. Swarts. 4. J. W. Thomson, Jr.
5. James S. Cuming. 6. James E. Randall.

INDEPENDENT TELEPHONE MOVEMENT.

in the stock and business of the Central Telephone and Electric company has kept the firm exceedingly busy. Mr. Cuming's policy has been to give full value for every cent paid, to never let any customer have a just cause for complaint, to hold up to the highest standard of quality on instruments, and never allow quality to be sacrificed to price. The company has maintained an excellent reputation for financial responsibility.

Stanley S. Stout.

While the development of the independent movement was made possible by the expiration of the fundamental Bell patents, there were several serious obstacles to be overcome, not the least of which were the switch patents, known as the Watson and Roosevelt patents. These were subjects of litigation, and it is said that the decisions recorded against the Bell interests in these cases were the only complete defeats sustained in patent litigation by that powerful corporation. Stanley S. Stout conducted the litigation for the Western Telephone Construction company in these actions. Mr. Stout was for several years a Patent Office examiner before practicing law. He has, however, had wide experience since in electrical patent litigation.

J. W. Thompson, Jr.

The head of the J. W. Thomson, Jr., & Co. Manufacturing company of Bedford Indiana, is only 28 years old. He was born in Clark County, Ind., and received his primary education in the public school at Jeffersonville, and afterward took a course in electrical engineering at the Purdue University. After leaving college he was engaged for about a year in contracting, principally in installations of electric-light plants. He then turned his whole attention to telephony, in which pursuit he has achieved success.

James D. Randall.

A representative of the southern telephone interest is presented in Captain James D. Randall of Memphis, Tenn., who entered the field of independent telephony in 1884 with the Pan-electric Telephone company. With 12 other citizens of Memphis he purchased the rights for Tennessee at that time. After organizing the state company it was deemed advisable to commence operations in Memphis, and a local company was chartered under the name of the Memphis Pan-electric Telephone company, and Mr. Randall was elected secretary, treasurer and manager of this company. After about 100 telephones were put in and connected to switchboards, the American Bell Telephone company obtained injunctions in Texas and Missouri against companies using the Pan-electric telephones, after which the directors of the Memphis company decided that it was only a question of time when they would be compelled to close, so the work was discontinued and the business wound up. Captain Randall, believing there would soon come a time when telephones could be sold and operated outside of the Bell circle, made a study of this very valuable instrument and has worked faithfully in this line ever since. He has superintended the construction of exchanges in Tallahassee, Fla., Jonesboro, Ark., Greenwood, Corinth and Holly Springs, Miss., and sold telephones and switchboards in several towns and for private lines in the South. He has also made several very valuable improvements in telephones, most of which have gone to the public.

Henry J. Swarts.

Among the inventors and manufacturers who have attracted attention in the independent movement in the South, Henry J. Swarts, the inventor of a novel form of switchboard, occupies a conspicuous position. Mr. Swarts has made Knoxville, Tenn., his headquarters and he has formed the Swarts Switchboard and Electric company, to manufacture under his patents. Mr. Swarts is a native of Port Byron, N. Y. He entered into the telephone field in 1883, his first experience being at St. Joseph, Mich. He was later appointed district inspector, with headquarters at Kalamazoo, and remained with this company six years, the last two years finding him in charge of the sub-exchange in Detroit. He resigned this position to accept one with the Chicago Telephone company, where he had about a year's experience. His next change was made when he received the appointment of electrician with the East Tennessee Telephone company at Chattanooga, Tenn. He joined the ranks of the Southern Bell Telephone company at Atlanta, Ga., and remained in Atlanta five years. His experience with the Bell interests has proved valuable, as he is thoroughly familiar with their apparatus. The switchboard which he is now manufacturing is said to have been entirely his own invention, even to the smallest detail.

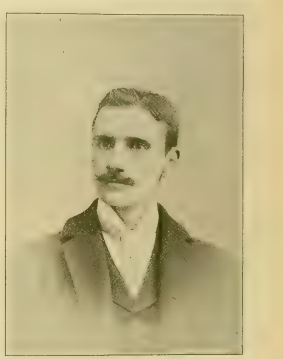
Messrs. Whitman and Couch.

The firm of Whitman & Couch, telephone manufacturers, started in 1895 with a small office and shop in which only three men were employed. Gradually the business increased till they required a complete factory to make all parts and assemble the work. This they established at 196 Summer street, Boston, Mass. Portraits of the members of the firm are presented herewith.

R. L. Whitman handles the finance of the concern and attends to the home office. He has been in the telephone business since his graduation from Harvard College in 1895.

S. H. Couch is the practical man of the firm, having been engaged in electrical work for the last 12 years. Mr. Couch makes a trip every year visiting exchanges throughout the country.

An example of the work of this concern is furnished in the case of the People's Telephone company of Haverhill, which was incorporated under the laws of Massachusetts with a capital stock of $1,000, and in 1895 built a few lines for private individuals and a few corporations, banks, etc. In 1896 the capital stock was increased to $11,000 and a general exchange was started with 150 subscribers. In 1897 the building was continued and subscribers added, until in 1898 the company was reorganized with Charles Spofford as president, Ira Sawyer secretary, and Raymond L. Whitman treasurer and managing director. At this time the number of subscribers had increased to 450 and the capital stock was increased to $100,000. This exchange is peculiar in that it is the only company in the telephone-exchange business incorporated under the laws of Massachusetts. The central station is different from any other central station in existence to-day, since the switchboard consists of a table 32 inches square with the jacks set in the top in a horizontal position to accommodate one thousand lines. Sections of 20 jacks may be added at any time. The drops are placed upon the walls of the room, so that with four girls, one sitting at each edge of the table, each girl faces 250 drops, and owing to the small space of the jacks, without doing any turning, each girl can reach any one of the one thousand jacks, thus reducing the number of operators to a minimum and making the service very rapid. All the lines of this exchange are metallic circuit and the Whitman & Couch telephones are used throughout. This company intends to push its lines throughout the eastern part of Massachusetts in the early spring and is anxious to connect with any exchanges in its vicinity.



S. W. MOON.

S. W. Moon, President of the Laclede Battery Company.

It was in March, 1894, that President S. W. Moon of the Laclede Battery company of Kokomo made his start in the electrical business. At that time Mr. Moon purchased from P. C. Burns the battery department of the Laclede Carbon and Electric company of Kokomo, and it was then that Mr.

Moon was appointed manager also of the American Electric Telephone company, also of Kokomo. The battery department, however, extended so rapidly that it became a business in itself and was run under Mr. Moon's management as the Laclede Battery company.

movement, and his experience with the two companies has eminently fitted him for his present responsible position. The American Electric Telephone company during the last few years has developed to such a remarkable extent and is said to be doing such a fine business that the position

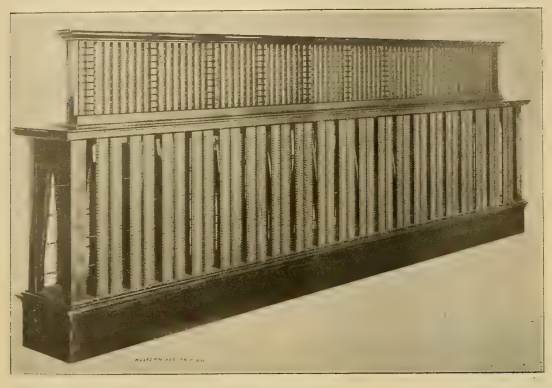


FIG. 3. FORT WAYNE TELEPHONE EXCHANGE.

In the spring of 1897, when the factory of the American Electric Telephone company was removed from Kokomo to Chicago, Mr. Moon transferred his headquarters to the office of the American company and took there the position of auditor and assistant manager of the latter company, but he still retained a proprietary interest in the Laclede Battery company, of which he is still president.

From this it will be seen that Mr. Moon has been identified with an independent telephone manufacturing company and a kindred interest practically from the start of the independent movement, and his experience with the two companies has eminently fitted him for his present responsible position. The American Electric Telephone company during the last few years has developed to such a remarkable extent and is said to be doing such a fine business that the position of auditor alone is one that practically occupies Mr. Moon's entire time.

Fort Wayne Telephone Exchange.

In the system of the Home Telephone and Telegraph company of Fort Wayne, Ind., all the wires in the central district of the city are underground and are encased in vitrified tiles laid in an envelope of concrete. The manholes are large and commodious, and afford every facility for drawing in new cables and testing for faults. The cables are of fiber insulation, made up in twisted pairs and encased in lead. All overhead wire is of hard-drawn copper, and metallic circuits are used throughout. The complete telephone equipment of this exchange was furnished by the Western Telephone Construction company. The switchboard, of 1,600 drops capacity, is shown in Fig 1, and is of the multiple-transfer type. The drops are restored automatically by the insertion of the plug into the jack. All of the switchboard cords are encased in spiral wrappings of hard brass wire, with an extra braiding of heavy polished linen ,reinforced in the heel of the plug as an extra precaution against breakage. The chief operator's set is shown at the left in the cut, and by its use the chief may cut in

FIG. 2. FORT WAYNE TELEPHONE EXCHANGE.

on a conversation of any operator to see whether she is attending strictly to business. The chief may also, have her telephone switched into connections with any subscriber in order to receive complaints or to give instructions to men who are out upon the lines. The distributing board is for 2,000 metallic circuits and is placed behind the main switchboard. The top can just be seen above the top rail of the switchboard proper. In Fig. 2 is shown the South Side branch exchange of this company, where 300 lines terminate, and through which connection is afforded with the main exchange by metallic-circuit trunk lines which run through direct. This branch exchange was established a few months ago in order to meet the rapid growth of the system, and it is probable, within the next few months, either it or the main board will have to be enlarged or else another branch exchange established in another part of the city.

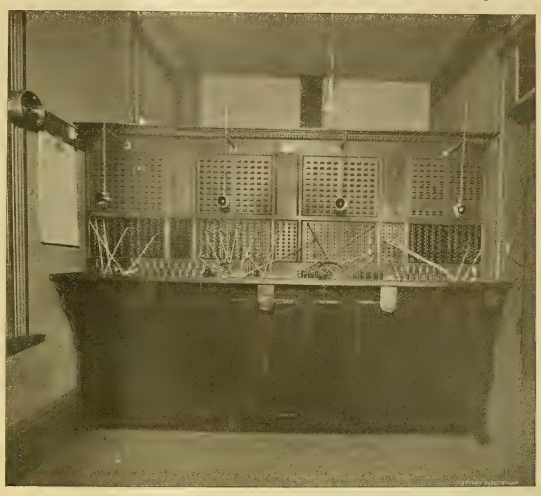
FIG 1. FORT WAYNE TELEPHONE EXCHANGE.

Fig. 3 shows the distributing board recently designed and constructed for large exchange work. This board is of the type recently installed as a complete lightning-arrester board, distributing board and test board in itself. The side of the board shown in the cut is that on which the lightning arresters are placed. Ample space is afforded beneath the board for cableways, and each cable is led up and fanned out to the terminals of lightning arresters. Jumper wires then run back from the lightning-arrester terminals around the horizontal rods shown on the interior of the boards and then up into the rack on top of the entire structure. This rack is provided with ways along which the wires run horizontally, a separate way being provided between the pins for each 100-section of wires. When the wire has reached the point opposite which it is desired to make a connection on the test side of the board, it is turned vertically downward over one of the pins shown and passes to the other side of the board and is connected to the proper test terminals. These test terminals form permanent terminals for the cable leading from the switchboard. A wire can be disconnected from its present number on the switchboard and transferred to any other number desired without confusion and in a few minutes. All of the transfer or jumper wires lie parallel with each other, and the arrangement is so open and systematic that any wire can be located in a moment. By means of a special plug which can be inserted in any one of the test clips it is possible to test out on any line in either direction of the subscriber or of the switchboard itself. This greatly facilitates the localization of trouble.

The history of this enterprise is an interesting one and affords a striking example of what good business management coupled with good engineering work will do in the face of almost every adversity. The plant began operation on October 1, 1896, with 856 telephones connected. At that time the switchboard capacity was 1,000. In December, 1896, the business had grown so that the installation of an additional switchboard section having a capacity of 300 drops was demanded, and in April of 1897 still another addition of the same size was made and the branch office was also established on the South Side of the city. It is a significant fact that the Bell company has not now as many subscribers in the entire city as are at present connected to the South Side branch of the Home Telephone company's exchange. Less than two years ago the Bell company had 528 subscribers, and now, although it has given free service to a great many patrons, the total number of stations is less than half that number.

The plant of the Home Telephone company cost $190,000. A two per cent. dividend was paid at the end of the first quarter after the exchange was put into operation, and a like dividend has been paid at the end of every succeeding quarter.

The original incorporators of the company were George W. Beers, Charles S. Bash, Louis Fox, W. J. Vezey and Charles M. McCulloch. These gentlemen represent the largest financial and industrial interests in the northern part of Indiana. The officers of the company from the beginning have been as follows: President, George W. Beers; vice-president, S. M. Foster; secretary, L. Fox; treasurer, Charles M. McCulloch.



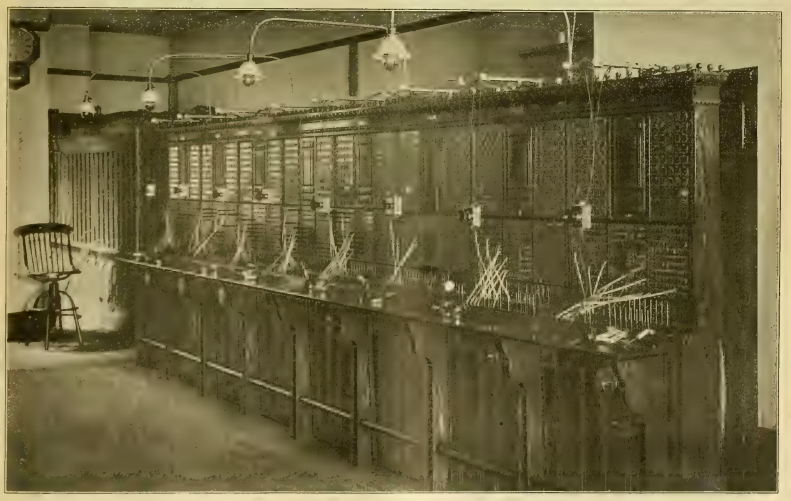
EQUIPMMENT OF KEOKUK, IOWA, EXCHANGE.

Equipment of Keokuk, Iowa, Exchange.

An example of modern telephone-exchange equipment is presented in the accompanying illustration of the operators' room of the Mississippi Valley Telephone company at Keokuk, Iowa. The switchboard was made by the Stromberg Carlson company of Chicago, and has a capacity of 400 subscribers. There are now 350 connected to this exchange, and the service is pronounced thoroughly satisfactory in every particular. The board is simple, swift and sure, with the fewest moves and the shortest distance for the hand to travel. Referring to the cut, it will be seen that the design is compact and handsome, and meets the needs of operators.

Portland, Ore., Exchange.

One of the largest plants installed by the Standard Telephone and Electric company is located at Portland, Oregon. The switchboard shown herewith for this exchange was manufactured over two years ago and has a total capacity of 2,500 numbers. More than half of this number are connected to the board. The exchange has been popular from the first. Both the telephones and the switchboard



PORTLAND, OREGON, EXCHANGE.

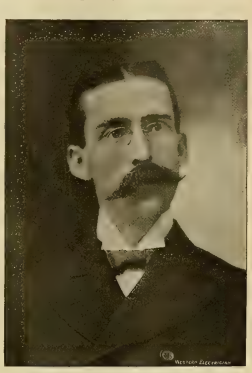
are satisfactory in workmanship and operation. The same claim is made for all the exchanges installed by the Standard company, among which may be mentioned Jacksonville, Fla., San Jose, Cal., Madison, Wis., Marquette and Ishpeming, Mich., and Sioux City, Ia. The board at this point, while furnished through the Standard company, is not of its manufacture; it has, however, given fairly good service, and with some slight modifications which have since been made is still doing good work. Upward of 300 exchanges have been installed by the Standard company.

P. C. Burns.

The president and controlling factor in the American Electric Telephone company of Chicago, Mr. P. C. Burns, got an early start in the business and has since retained his interest in its development. While a mere boy of 15 he started in the business of making acoustic telephones at his father's home under the name of the Vicinity Telephone company, and at 16 was employed by the Bell company as operator and later as inspector in the Chicago exchange. He worked in the factory of the Electrical Merchandise company, which made apparatus for the Bell company, and afterward was sold to the Western Electric company. Then he became a traveling salesman for the Railway Telegraph Supply company, which was later called the Knapp Electric Works.

He started the first electric-supply agency on the South Side of the city of Chicago as agent for the Standard Electric Works of Cincinnati, O., and started the first electrical supply agency in St. Louis —the St. Louis Battery company.

Mr. Burns invented the "microphone" carbon battery, which had a large sale, and disposed of his patents to the New Haven Clock company, now the National Electric Manufacturing company of Milford, Conn. He established and conducted the St. Louis Electrical Supply company, the Findlay Glass and Carbon company, the Peru Electric Manufacturing company, the Laclede Carbon and Electric company (the last two being manufacturers of electric-light supplies) and the American Electric Telephone company of Chicago. He is president of a number of prosperous telephone companies and toll-line companies in different parts of the country, and has had an extended and varied experience in the manufacture of electrical specialties. He has, moreover, been successful in all his enterprises. About 10 years ago he owned the Rose & Rein Electrical Works of St. Louis, and also engaged in the manufacture of apparatus for the Pan-electric Telephone company, having large exchanges at St. Louis, Little Rock and other points, but on account of the vic-



P. C. BURNS.

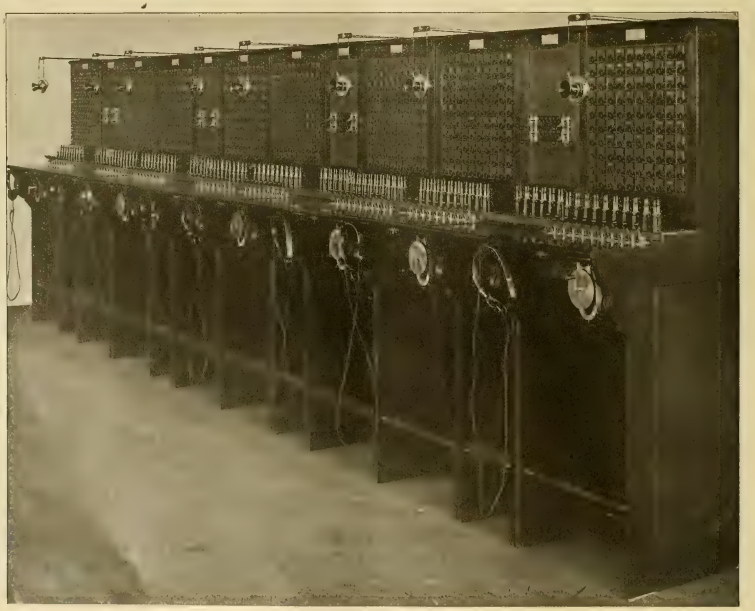
tory of the Bell company on the receiver patent he was obliged to discontinue for a time. He returned to the telephone field, however, as soon as it was open to independent companies. Mr. Burns built the first vitrified porcelain works in the West, the Peru Porcelain Works, for the manufacture of insulators and fuse blocks. He was the inventor of the Laclede and Hercules batteries, and made many improvements in other specialties. He also introduced granular carbon transmitters for sale outright to the trade in this country at least a year before the other companies.

Expansion of Independent Systems.

By H. C. Dodge.

The fact that the independent telephone movement is rapidly becoming national in character is apparent upon examination of late maps of exchanges and territorial lines operated by the independent companies, which show that rapid strides are being made in every section of the Union. In Michigan the city of Grand Rapids represents the center of a district in which the independent companies are strongly intrenched, there being an aggregate of approximately 7,500 telephone stations connected in the district, between each one of which it is possible to communicate in a satisfactory manner. The accompanying map shows lines and connections of the Citizens' State company, Muskegon company, Citizens' Mutual Telephone company and Central Telephone company. In the cities of Grand Rapids, Kalamazoo, Lansing, Muskegon, St. Joseph, Benton Harbor, Holland, and, in fact, all of the principal towns connected, the opposition companies have practically driven the Bell company from the field and are extending their lines at the present time in all directions and are reaching districts which heretofore have not been afforded the benefits of telephone service. This system located in the western portion of Michigan will in the near future be connected with that operated in the eastern district and include territory contiguous to Detroit. It will also be connected with the magnificent opposition systems in operation in the states of Ohio and Indiana, with their hundreds of miles of metallic circuits and important cities equipped with high-class exchanges.

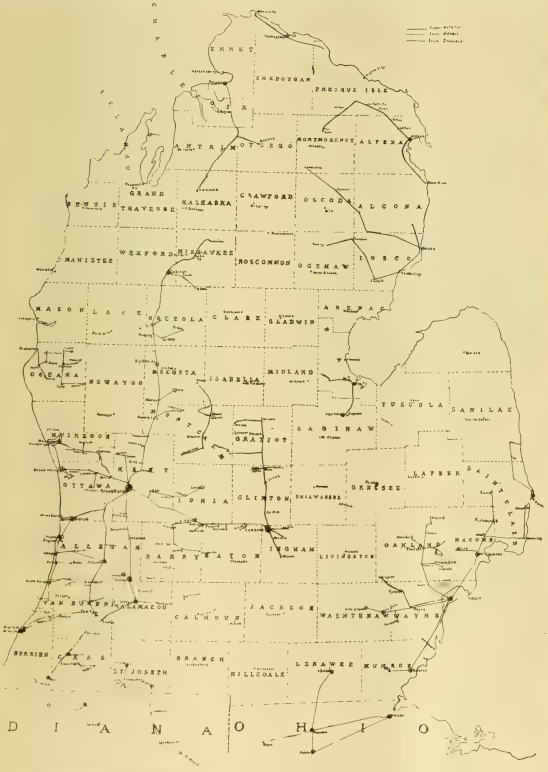
Fortune is smiling upon the promoters of the new companies, whose success has been assured because it has been possible for them to secure apparatus with which they can successfully compete with the best service the Bell company can provide. The necessity for furnishing high-grade equipment has called for heroic efforts on the part of manufacturers of exchange equipment, and that they have been equal to the task has been fully demonstrated by the excellency of appliances turned out. The 800-line express switchboard of the Kalamazoo exchange, shown herewith, fairly represents the highest development of the art of manufacture of high-grade central-station equipment and is the result of extensive experience in making this class of apparatus, the efficiency of which has been fully demonstrated. All requirements for perfect service have been met. These boards are furnished adapted for use in exchanges of any size up to those requiring connec-



EXPANSION OF INDEPENDENT SYSTEMS. KALAMAZOO EXCHANGE.

tion of several thousand lines, and are wired for use in connection with common return or ground circuits or complete metallic circuits, equipped with series or bridging-bell telephones. Trunking apparatus is provided for connection between distant sections, the employment of which assures rapid, simple and reliable method of handling calls of large exchanges. The back of several sections of the express board as wired and connected in a central office lately equipped by the American Electric Telephone company shows great perfection in the matter of arrangement of details. Many installations of equal merit have lately been completed, and in these the distributing boards, combined lightning and fuse arresters and cable-terminal arrangement show the same symmetrical and harmonious plan of arrangement of details as that shown in the cut.

Not only are the independent companies installing perfect city-exchange systems, but the new toll lines are being equipped in an up-to-date manner. Copper metallic circuits are being constructed, properly transposed and balanced as regards their electrical qualities and conditions; highly efficient bridging-bell telephones are being used almost exclusively in connection with such lines, and toll-line switchboards equipped with special appliances required to develop maximum efficiency of service. Repeating coils used are of the highest type. Bridging-bell telephones are equipped with generators having



EXPANSION OF INDEPENDENT SYSTEMS. MAP OF MICHIGAN STATE LINES AND CONNECTIONS.

the required heavy quantity output, combined with ability to ring through high resistance. Ringers have high coefficient of self-induction, making them sensitive to the influence of magneto current. Solid back transmitters of high power and efficiency are being adopted almost exclusively, and with such apparatus procurable, a complete understanding of the requirements called for and a disposition to meet them, the outlook for the continued advancement of the independent companies is highly promising for 1898.

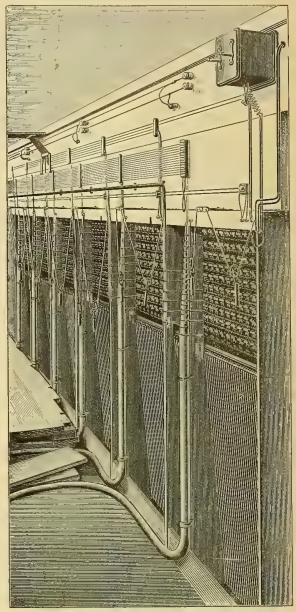
Independent Telephone Movement in Chicago.

The independent telephone movement seems to have reached a stage where its advocates are taking steps to set up shop in such a stronghold of the Bell company as Chicago. Hitherto it has been deemed that the operation of a competitive exchange in this city would be a hazardous undertaking, so well intrenched is the Chicago Telephone company by priority, franchises, occupancy of the streets, financial strength, and, it is fair to add, the skill with which its business is conducted. However, it seems that there are those who are willing to take the preliminary steps, at least, for the operation of an opposition company, although the proposition is surrounded with a certain degree of mystery, so that it is not known to what extent it will be developed.

At the last meeting of the City Council two new telephone ordinances were introduced. One was presented by Alderman Kahler, giving the Independent Telephone company of Chicago a franchise to maintain wires and an exchange in Chicago. The company is required to pay three per cent. of its gross receipts as compensation to the city semi-annually, and is expressly prohibited from selling, leasing or transferring its franchises. The company is prohibited from charging more than $75 per annum for each telephone for the first year and $70 for each year thereafter. In cases where contracts are made for three years or more the maximum charge is $65. The company is required to furnish all the departments in the city hall telephone service free of charge and to furnish the city fire and police telephones at $1 each. By the provisions of the ordinance the company must have 2,000 instruments in operation on and after January 1, 1902.

Alderman **Kahler** refused to give any information as to who was behind the company, but he said it was projected by Chicago capitalists who had plenty of money.

The other ordinance was introduced by Alderman Kimbell and gives to S. J. Haefield, his associates or successors, the right to establish 50 long-distance telephone stations in the city of Chicago and to operate wires in connection therewith. According to the provisions of this ordinance, Mr. Haefield must pay five per cent. of the gross receipts to the city of Chicago. Alderman Kimbell declared that the company was backed by large lumber interests in



EXPANSION OF INDEPENDENT SYSTEMS—WIRING OF BACK OF SWITCHBOARD.

Wisconsin, and that it already had lines in operation in that state. According to Alderman Kimbell, Mr. Haefield is only the superintendent of the company at Menomonie, Wis., and is not one of the capitalists interested. Both ordinances were referred to the committee on gas, oil and electric light.

Keystone Telephone Company.

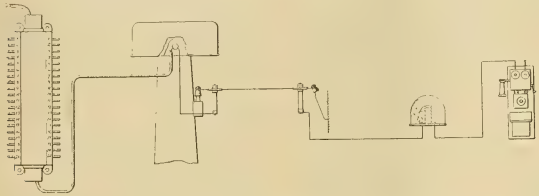
The Keystone Telephone company of Pittsburg has progressed so rapidly during the last year that it is now counted among the leading telephone manufacturers in the country. Its telephone apparatus is among the high-priced goods on the market, but it is nevertheless desirable to purchase, inasmuch as it is guaranteed to give lasting and good service without necessity of repairs. The company's switchboard apparatus is considered equal if not superior to other switchboards, and is of such importance that this department of the factory is crowded to its utmost capacity at all times. The company is so busy that the factory force has been compelled to work till 9:30 p. m. every day in order to keep pace with increased trade. A large portion of the Keystone company's business has been done with exchanges that have been fitted with other telephones. Many recent contracts have been made, among them the 900-drop switchboard for the Youngstown Telephone company, Youngstown, Ohio, a 400-drop full metallic switchboard for the Home Telephone company, Oskaloosa, Ia.; a 300-drop system for the Uniontown Telephone company, Uniontown, Pa.; a 300-drop system for the Connellsville Telephone company, Connellsville, Pa., a 200-drop system for the Scottdale Telephone company, Scottdale, Pa., a 100-drop system for the Wellsburg Telephone company, Wellsburg, W. Va., a 200-drop system for the Moundsville Telephone company, Moundsville, W. Va., and a 300-drop system for the Washington Telephone company, Washington, Pa. Besides these complete systems, the

company is furnishing large numbers of long distance telephones which are guaranteed to have no superior and few equals in the market.

Telephone Protective Devices.

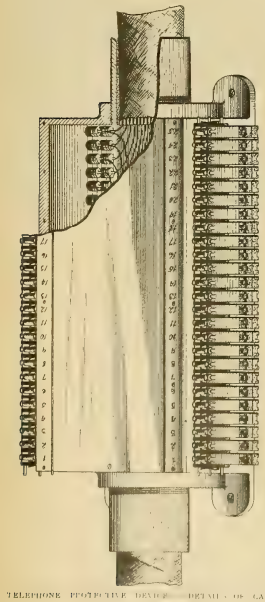
The system of protecting telephone cables and apparatus illustrated in the accompanying cuts is manufactured by the Sterling Electric company of Chicago.

The combined cable terminal and protector is made in sizes from 25 to 100 pairs of wires. The box is of iron and brass, with springs mounted upon the outside. The aerial or underground cable en-



TELEPHONE PROTECTIVE DEVICES.—DIAGRAM OF COMPLETE SYSTEM.

is taken to a spring in contact with a block of carbon. This block is separated from another similar block by a perforated mica plate. The latters at one end of the terminal, passes thence to the outside row of connectors, and from these a branch carbon is held in place by a spring connecting with ground, the surfaces of the two carbons being separated only the thickness of the mica, which is .005 of an inch. This branch circuit, including the carbon blocks, constitutes the lightning arrester. Imbedded in the surface of each of the carbon blocks is a small metal or carbon ball held in position by easily fusible wax. The passage of a current of a high potential from one carbon block to the other cre-

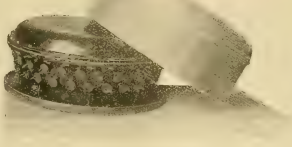


TELEPHONE PROTECTIVE DEVICES.—DETAILS OF CABLE TERMINAL AND PROTECTOR.

ates an arc, which heats the carbon in a few moments sufficiently to melt the wax and release the balls, which fall by gravity, thus leaving a direct connection between the two blocks of carbon. This is one of the features of the disappearing protector. From the same connectors there is an circuit passes to the line spring, thence through a heating coil to another spring which is connected to the wire leading to the distributing board. This heat coil is composed of a number of windings of German silver wire upon a V-shaped metal spool, which is in two parts, united by fusible solder. Upon the passage of even a very slight current, such as .16 ampere, the coil becomes heated, the solder melts and releases the two parts. This allows the two springs to fly back and make connections, the line spring direct to ground, while the spring on the switchboard side closes a circuit which automatically sounds an alarm and calls attention to the break. This is the sneak-current feature of the protector.

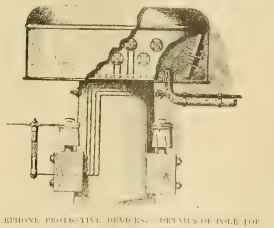
To protect the cable itself against injury, a line fuse is provided. It is a pair of connectors mounted upon either end of a piece of enameled wood tubing about four inches long and one-half inch in diameter. A fuse wire of about five-ampere capacity uniting the connectors through the wooden tube, which is hermetically sealed, prevents any damage from the weather. This fuse is placed at the outer end of the cable and is operated by the action of either the sneak-current or the strong current protector, which causes the fuse to blow whenever a current dangerous to the cable passes over the line fuse.

The pole-top terminal is made up in sizes of 25 to 100 pairs of wires, is of solid iron in three parts and circular in form. It is placed directly upon the top of the pole, which has first been sawed



TELEPHONE PROTECTIVE DEVICES.—VIEW OF POLE-TOP TERMINAL, COVER REMOVED.

square. The cable is brought into the terminal from the bottom, the lead cover being stripped back and the wires spread to connecting points. These connections appear upon the inside of the terminal through hard-rubber bushings, and correspondingly upon the outside of the terminal. The bushing is secured through the terminal in a permanent and air-tight manner, the connections through the bushings being numbered consecutively upon the bottom piece of the iron casting. From the outside

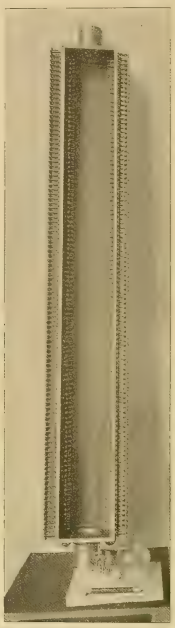


TELEPHONE PROTECTIVE DEVICES.—DETAILS OF POLE-TOP TERMINAL AND LINE FUSE.

connection upon the rubber bushing a spider wire is carried to the line wire upon the cable pole. The cable in the terminal, where it comes into the same, is soldered in place. A rubber gasket is used to make an air-tight joint between the body casting and the lid casting of the terminal. Outside and over all of these is a one-piece copper cover which fits down closely over the entire terminal, being slid into place by the rubber gasket, making it absolutely safe from any weather.

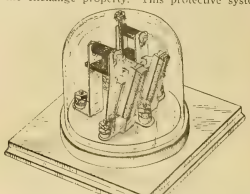
Before sealing either the terminal and protector, or the pole-top terminal, there is placed within the case four or five pounds of quick-lime which absorbs every particle of moisture within the terminal.

The two-wire protector to be used at the subscriber's station is assembled upon a porcelain base, covered with an oval glass case. It consists of



TELEPHONE PROTECTIVE DEVICES.—VIEW OF CABLE TERMINAL AND PROTECTOR, ALSO TWO-WIRE SUBSCRIBERS' PROTECTOR.

heat coils between two tension springs, one side of the spring also going to a carbon and mica arrester, similar to that used upon the cable terminal and protector already described. The heat coil operating at .16 ampere throws the line to ground and opens one side of the circuit. The line fuse is used upon the outside of the subscriber's station and operates in connection with the two-wire protector in a manner similar to the combined terminal and protector. This gives the subscriber's apparatus and premises exactly the same protection as the exchange property. This protective system



TELEPHONE PROTECTIVE DEVICES.—SUBSCRIBERS' TWO-WIRE PROTECTOR.

is the only one that has been approved and endorsed by the National Board of Fire Underwriters, except one owned by the Bell company.

The switchboards, transfer boards and cross-connecting boards manufactured by the Sterling Electric company are practically the same as those the Bell company is now using. This is quite an innovation in the independent telephone field, and one that can be appreciated by operating as well as construction companies.

Western Telephone Construction Company.

The Western Telephone Construction company of 250 South Clinton street, Chicago, reports the largest business in its history. Its factory has been doubled in size and quadrupled in capacity within the past year. It has now a complete nickel-plating plant which is taking care of the entire work in this branch.

Fig. 1 illustrates the company' standard long-distance telephone instruments, which, it is claimed, "speak for themselves" if one will only give them a trial. This instrument is equipped with a very powerful magneto generator and call bell and is designed either for bridged or series work. The hook switch is of the Western type but has been recently greatly

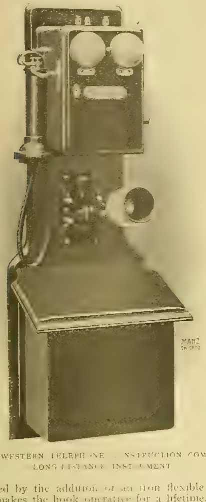


FIG. 1 WESTERN TELEPHONE CONSTRUCTION COMPANY LONG-DISTANCE INSTRUMENT

improved by the addition of an iron flexible shoe which makes the hook operative for a lifetime. All contact points on the switch are platinum-pointed, thus insuring complete immunity from corrosion. The receiver is the well-known bipolar type, and the transmitter is of the granular carbon long-distance type mounted on a handsome enameled iron arm, which is, in turn, mounted on a base of soft cast-iron in which is encased the long core induction coil. This coil is wound on a spool of red fiber and encloses a very heavy core of fine Swedish iron wire; both primary and secondary are of silk and the coil is particularly adapted for use with this transmitter. These instruments are made with single, double or triple cell battery boxes, and are finished in either oak, walnut or cherry, and, in fact, on special order, in any special wood obtainable. The complete telephone equipment of the Astoria Hotel was recently furnished by this company, all of the instruments and switchboards being made in solid mahogany.

Fig. 2 shows one of four types of cabinet desk telephone sets, which is made in cherry and is provided with a plate glass carrier. The telephone parts are of the same kind as used on the wall set, but, of course, are differently mounted. The other three types are equally handsome and each is particularly fitted for a certain class of work.

Logansport Mutual Telephone Company.

The Logansport Mutual Telephone company is owned and managed by L. B. Overshiner. The exchange was built in 1895 and started with 182 subscribers and without a single outside connection. It now has over 900 subscribers, and 250 outside towns and cities in Indiana and Illinois are connected by toll lines. The Bell company has placed the service at 75 cents per month for residences and $1 per month for business houses, and in several cases given service free. The express switchboard of this company makes possible quick, reliable and satisfactory service, and the simplicity of the board at once commended it to the owners and managers of telephone exchanges. The board has been manufactured one year, and in that time many have been placed in Indiana. The Logansport company has arranged to string about 8,000 feet of cable early in the spring and extend quite a lot of toll lines. Toll line business is good.

Influence of Organization in the Independent Telephone Movement.

By James M. Thomas

Organization is necessary for the best success of any business. This is axiomatic and will, therefore, be accepted without argument, as applying to the independent telephone movement. The first step toward effecting the organization of operators of exchanges was held in Newark, Ohio, in February, 1895, and was attended by a few gentlemen who had been drawn together to inspect the exchange of the Newark Telephone company, which had just been opened. After a full discussion of the business and its future prospects, it was agreed that, to bring about the greatest success, an organization should be formed to watch and promote the interests of all operating companies, believing that a state organization would encourage the building of other exchanges. So a call was issued to all the companies then organized in Ohio to meet in Columbus for the purpose of discussing the advisability of such an organization.

In pursuance of this call quite a large number of delegates attended, and a very interesting discussion of everything pertaining to the good of the movement was listened to by those present. This meeting, which was held in April, resulted in the organization of the Independent Telephone Exchange association of Ohio, which has ever since existed.

The rapid development of the movement in Ohio is due to this organization, as it attracted the attention of the people to the fact that the undertaking was meeting success wherever attempted. Frequent meetings were held and the press of the state gave notice of the movements of the independents, though no encouragement was offered until the movement had attained more portentious magnitude, as shown through this organization.

Indiana and Western Pennsylvania followed the

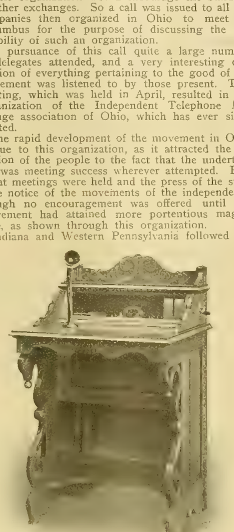

FIG. 2 WESTERN TELEPHONE CONSTRUCTION COMPANY. CABINET DESK SET.

example of Ohio in organization, through the efforts of gentlemen residing in these states, who had attended the meetings of the Ohio association. After the organizations in those states a joint committee was selected, composed of members from Pennsylvania, Ohio and Indiana, which took up the work of a general organization, together with other important matters of general concern to all who were anxious to promote the interest of the independent telephone movement.

This joint committee met at the Hotel Imperial, New York, last March and after conference and much labor formulated a plan for general organization. The committee met again in Columbus, Ohio, in April, and in March met in Fort Wayne, Ind., with many gentlemen from different parts of the United States, and directed a call to be issued for a meeting of all operators for the purpose of forming a general organization for mutual benefit. But before this call was issued, another had been sent out for a convention to be held in Chicago in May. This brought together a large number of delegates, and after a temporary organization it was agreed to issue a general call for the purpose of organizing an association of all operating companies in the United States, to meet in Detroit on June 22d.

The Detroit meeting attracted universal attention and the press of the country gave much space and a great deal of encouragement to the movement, whereas previously the tendency was against the movement.

Many states immediately after the Detroit convention took up the work of organization, with the result that at present most states in which the movement has found a foothold have flourishing state associations.

Having given a very brief outline of the history of the organization, I pass now to the consideration of its influence in the independent movement.

The direct result of organization is promotion. The rapid growth of this movement is due to the fact that those who have invested their money depend upon intelligent organization to preserve and foster their investments and place within their power the facilities of competing, to advantage, with our rivals in this field. This is the secret of the success of this movement. The American Bell Telephone company and its lessees have, since this movement started, through their agents and managers, tried to convince the people that the investors in independent exchanges are fools and have been duped by the manufacturers of independent apparatus, who have deceived them in order to sell their product. This is not the reason for this movement, and this argument has proven a failure; something has made it grow in spite of all threats and misrepresentation, and the people fully realize that the movement is not in the hands of fools or dupes.

The immense wealth of the American Bell Telephone company made it necessary that a general organization should be formed. It would not have been wise to attempt to fight a corporation with its allies so well intrenched without an organization ever watchful and alert.

The independent telephone movement is in this brief time of its existence better organized than most commercial enterprises of similar character. The operators are in touch with each other, and the knowledge of those of great experience is sought through this organization by those of less experience. Correspondence has become voluminous, and the movements of a company in California or elsewhere are soon known by all. The work of organization, however, is just begun, and must be perfected rapidly if this movement shall attain its highest possibility.

Effective state organization must be kept up to watch matters of local concern, such as taxation and legislation generally. The legislatures of the several states are very busy with proposed laws of all kinds, affecting the independent telephone interests—some good and some bad, and some appearing good at first thought, but bearing within them dangers to this movement. The state organizations are watching these proposed laws, and in states where an organization has not yet been formed a meeting should be called at once for that purpose.

The Independent Telephone Association of the United States of America watches and promotes the business generally, but cannot effectively reach the legislatures of the several states. Local organizations can do this.

This organization has now reached a point where the demand for intermunicipal connections calls for a general company with sufficient capital to connect the independent companies into one system. Many long lines are now built by companies covering certain territory.

The general company with ample capital is in sight. This new organization is going to succeed

because "Better facilities for long-distance services at a rate within reach of the majority of the people" is inscribed upon its banner.

Telephone Literature.

An interesting contribution to the literature of telephony is a publication of the American Electrical Engineering association, entitled "Patented Telephony." It is a review of the patents pertaining to telephones and telephonic apparatus, and is intended for reference for investors and inventors, engineers and attorneys engaged in telephony. It is claimed that there are now 4,000 United States patents which cover apparatus and improvements in telephony. Of course only the salient features can be covered in a treatise of this kind. The work is profusely illustrated, and a very good index accompanies it.

The "Telephone Hand Book," published by the Electrician Publishing company, is the most comprehensive and practical work obtainable to-day, as it covers the field concisely and contains valuable information for inventors, engineers and operators, in fact everyone interested in the telephone industry. A new edition of the work has just been issued.

Western Electrician.

EVERY SATURDAY.

PUBLICATION OFFICES:

Suite 510 Marquette Building, CHICAGO.

TELEPHONE, MAIN 1746.

EASTERN OFFICE: 108 TIMES BUILDING, NEW YORK.

Trade Supplied by Western News Co.

COPYRIGHT.—Not only the title but the *entire contents* of each number of the WESTERN ELECTRICIAN are copyrighted. This paper is entered at the Chicago postoffice as mail matter of the second class.

SUBSCRIPTION, in advance, postage prepaid, $3.00 for a full year of 52 numbers; in clubs of four or more, $2.50, with free extra copy for eight subscriptions, foreign countries, $5.00 a year; single copies, 10 cents. When change of address is requested, the old address as well as the new should be given.

CORRESPONDENCE relating to electricity or any of its practical applications is cordially invited, and the co-operation of all electrical thinkers and workers earnestly desired. Clear, concise, well written articles are especially welcome; and communications, views, news items, local newspaper clippings, or any information likely to interest electricians, will be thankfully received and cheerfully acknowledged.

ADVERTISING—THE WESTERN ELECTRICIAN—**the only general electrical paper published in the West**—thoroughly covers a territory *exclusively its own*. THIS IS A CLAIM WHICH CAN BE MADE BY NO OTHER ELECTRICAL JOURNAL IN THE UNITED STATES. Electrical merchants and manufacturers *desiring western trade* will appreciate the UNEQUALED VALUE of this journal as an advertising medium in its special field. Advertising rates are moderate, and will be furnished on application.

In magnitude and vitality the independent telephone movement in this country to-day surpasses the fondest hopes of its most earnest advocates. It has spread with wonderful rapidity, especially in the enterprising western cities and villages which had been entirely neglected previous to the advent of the opposition companies or subjected to the ordeal of higher prices and less modern service than now prevail. Those who enjoy the superior advantages of modern Bell equipments for large cities cannot fully appreciate the eagerness with which the residents of smaller towns greeted the advent of an opposition company offering a service, correspondingly as good; but it is only necessary to understand the condition of the country generally in the way of telephone service at the inception of the independent movement to realize the extent of the field that was opened up by the expiration of the fundamental Bell patent. This field has been assiduously cultivated ever since, many of those engaging in the independent movement having gained their experience with the old concern and being thoroughly alive to the opportunity and demand awaiting them. Naturally, they have profited by the mistakes of their old masters; they are cultivating public favor, and the popularity of their course is everywhere indisputably attested.

In this issue of the Western Electrician an effort has been made to give some idea of the character, extent and scope of the movement, particularly the manufacturing and construction interests. Typical exchanges are illustrated and representative apparatus is shown and described in detail. An examination of these features affords convincing evidence that standards have been established in no way inferior to the best Bell practice. This, of course, has had much to do with the success of the movement. It may surprise some who have not followed the matter closely to learn that already an intercommunicating system has been established between the cities and villages in many localities, and that the idea is likely to be developed still further. When it is considered that there are in round numbers in the neighborhood of 2,500 independent exchanges in operation in the United States to-day, the possibilities of such a system will be better understood. The outlook is certainly promising, and, judging from the record already established by those identified with the opposition interests, there is every reason to anticipate a splendid future for the independent telephone movement.

In recognition of the splendid advancement that is being made in the independent telephone field, technically and commercially, and in order to better serve the demands of this growing class of electrical workers, the Western Electrician will hereafter present each week in a special telephone department the latest achievements, inventions and modifications in telephone apparatus, as well as the commercial news pertaining to this branch of the business. A special feature will be made of contributions upon practical subjects, prepared especially for workers in this field.

Uniformity in diagrammatic representation of electrical apparatus would doubtless prevent much confusion, and the establishment of a code is for many reasons greatly to be desired. The Chicago Electrical association has prepared a set of diagrams which it offers for approval. The drawings are presented on another page of this issue, together with the suggestions and explanations of the committee which compiled the report. They should be carefully scanned and considered. No doubt those who are actively engaged in designing apparatus and are brought constantly in touch with the Patent Office will appreciate the efforts of the association and give the subject careful attention. It is not to be expected that the proposed diagrams will meet the views of all, and it may be found desirable to make some changes and additions. The subject will require much thought and discussion before the general adoption of any plan can be hoped for.

One of the most decisive victories scored against the advocates of municipal lighting plants is reported from Tonawanda, N. Y., where the proposition to bond the village for $25,000 to build a lighting plant was submitted to the taxpayers. The total number of votes cast was 403, out of which 339 were opposed to the proposition and only 64 in favor of it.

An electrical gathering of more than usual interest is that planned for Laredo, Texas, on March 9th, 10th, 11th and 12th. It will be an international meeting of the Gas and Electric Light association and the Street Railway association of Texas with a number of Mexican gentlemen engaged in like pursuits. Laredo is a city of about 12,000 inhabitants, situated in Southern Texas, on the Rio Grande River. Its principal railways are the International and Great Northern and the Mexican National. The gentlemen in charge of the convention say that the hotel accommodations are ample and that exhibits will be well taken care of. Special low rates of railroad fare have been secured on the International road, and a good attendance is expected. An elaborate programme of papers has been arranged, and provision is made for excursions across the river into Mexico and to other near-by points of interest. To a man in Chicago or New York Laredo seems a long distance away, as indeed it is; and it is encouraging to note the activity and energy of our southern electrical friends. This progressiveness is the hall-mark of the electrical industry everywhere. We wish for the Texan and Mexican electrical men a convention of real usefulness as well as a pleasant social gathering.

It is the common belief that inventors as a class are poor business men—the better the inventor, the poorer the business man—and it must have been upon this assumption that Representative Reeves acted when he introduced his bill in Congress which has created such a stir among inventors and manufacturers alike. Doubtless when he conceived the idea the Illinois congressman thought he was conferring a benefit upon a down-trodden class, but by this time he must feel that they are very ungrateful. At any rate inventors and manufacturers are making vigorous protests against the passage of the Reeves bill which, according to its author, is intended to amend the patent laws of the United States so as to allow the more reasonable use of inventions and discoveries by the people and to protect the patentee. The bill empowers the commissioner of patents to place a tax of from one to 10 per cent. of the cost of production upon articles manufactured under patents granted under the act, such tax to be paid into the Patent Office. The bill also reserves to the United States the right to condemn patents at a fair cash valuation when it can be shown that the invention is of a character to be valuable to the people as a whole. It is pointed out by those opposed to the measure that the proposition to give the commissioner of patents the right to fix the amount of royalty to be paid on an invention is a distinct invasion of the rights of an inventor and of manufacturers as well, and it is contended that it would be simply impossible for an inventor to interest capitalists in his discoveries and inventions if manufacturers generally were allowed to make the patented article. The execution of such a scheme as that proposed by Mr. Reeves would require a revision of the laws of trade, and inventors would be placed absolutely in charge of the commissioner of patents. Furthermore, it is pointed out that it would be a radical error to curtail the use of patents by imposing a tax upon the manufacture of patented articles or the use of patents in manufacturing industries.

Art of Constructing Telephone Apparatus.[1]

By H. F. Clausen.

This paper should not be considered a guide for the telephone manufacturer, but merely a general review of what is being done by builders of telephone appliances.

Prior to Prof. Bell's discovery of the magneto-electric telephone the so-called "string telephone" was the only popular means of transmitting speech to a distance, but under the most favorable conditions only was it possible to successfully operate systems up to two miles in length. For circuits, however, exceeding 1,000 feet in length the mechanical telephone is capable of giving a cheaper and more satisfactory service than the best magneto-electric telephone yet produced, assuming of course that the local conditions are favorable.

The limiting distance at which mechanical telephones may be operated is prescribed by the kind of wire and supports employed, and more often by the extreme variations of the temperature. Briefly, when a circuit exceeds a certain length the capacity becomes great enough to defy all attempts at giving practical service; again, if the wire is improperly supported retardation proves a second evil, and if there is more than one circuit supported on the same poles the ever-present bugbear cross-talk ends all pretense of maintaining anything like a satisfactory service. Among the 175 patents granted to inventors of acoustic-telephone apparatus may be found some very interesting reading matter relating to mechanical telephony, for the designs cover transmitters, receivers, supports, signals, switchboards, repeaters and many other appliances common to the electric telephone of to-day.

The United States Patent Office has granted more than 3,000 patents on apparatus pertaining to the art of telephony, nearly 300 patents alone being on modifications of Prof. Bell's magneto-telephone discovery.

In view of the enormous number of different designs in actual use the author will make no attempt to describe more than one instrument of a class of apparatus. Furthermore, the instrument described should not be considered as representing the most advanced grade of manufacture, selected as the instruments were merely for the purpose of illustrating general principles employed without any special reference to their comparative merits.

In Fig. 1 A and B represent two telephone instruments connected together electrically by means of the wire W and the earth connections G and G'. The combination illustrates what is known as a ground-return telephone circuit. In Fig. 2, stripped of all confusing details, the circuits of an ordinary exchange telephone are shown, representing diagrammatically the several operative elements. Referring to the telephones shown in Figs. 1 and 2 we will divide them into eight sections, thereby allowing a more general description—the call transmitter C T, the call receiver C R, the speech transmitter S T, the speech receiver S R, the transmitter battery T E, the induction coil I, the circuit-controlling switch C C and the wood-case details W D.

The call transmitter C T is a magneto-electric machine arranged for generating an alternating current. The gear wheel G and G' are proportioned about 6 to 1—that is, if by means of the crank C the gear wheel G is turned at the rate of two revolutions per second, the armature A will revolve at the rate of 10 revolutions per second. Regarding the proper speed at which the armature should be driven, an average speed of 500 revolutions per minute is the usual practice; the speed should be governed, however, by the kind and construction of the apparatus it is intended to operate.

Referring to Fig. 4, we have a sectional view of the armature A, showing in detail the wire space A W, the contact pin A C and its rubber bushing C B. The wire space A W after having been thoroughly insulated is usually wound to about 500 ohms with 4,500 turns of No. 34 B. & S. gauge wire, 2,250 turns on each limb, it being understood, of course, that the windings may be varied to suit predetermined requirements. The hand-driven magneto generator, as it is employed in telephony, requires a class of construction producing the highest possible figure of efficiency. The permanent magnets employed must be made of the best magnet steel thoroughly hardened and carefully magnetized. The iron used in the construction of the armature and the pole-pieces P and P', Fig. 5, should be of the softest obtainable. In a well made generator the air gap between the face of the armature and the pole-pieces should be less than 20 mils. As a matter of fact an air gap of 12 mils can be produced and made to give practical service for a long time, limited only by the natural wear of the armature bearings.

There is also a fixed rule regarding the relative dimensions of the armature limb towards the pole pieces, as indicated in Fig. 5 A, the armature should just fill the space between the pole pieces P and P'. When in a horizontal position the space C in the pole piece should no more than exactly cover the armature limb. Briefly, in the first instance if the armature does not quite fill out the space between P and P' its polarity will not be quickly reversed. Again, if more than exists the space—that is, laps under on both sides, the armature never fully reaches its highest possible point of magnetization. In view of the foregoing it will appear obvious that the armature limb should just fit into the space C, Fig 5 B, for if it be too small no current would be generated during the time that both sides of the limb are covered by the pole-pieces. A less complicated, though equally important, piece of apparatus is the magneto ringer. Referring to Fig. 6, we find it is composed of a permanent magnet P M, the wire spools C and C' and the centrally pivoted armature A. The permanent magnet P M is a U-shaped piece of steel magnetized so as to produce a north pole at M and south poles at X and X'. Arranged as it is, however, with the iron connecting frame F, to which are attached the polar extensions S and S', the X and X' points in reality become neutral, whereas the extreme upper ends of the cores S and S have imparted to them a strong south polarity. The armature A, being thus placed directly in the path of the magnetic lines flowing from N to S and S', becomes polarized in a rather peculiar manner. A careful examination, however, will prove that it is the north polarity which predominates, but the actual polarization is so evenly distributed that the armature when examined appears to be almost neutral.

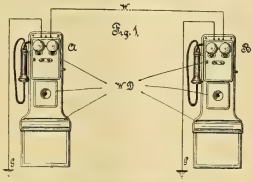
For regular local-exchange service each coil of the ringer need not be wound with more than 2,000 turns of single silk-covered copper wire 12.64 mils in diameter, with both coils connected in series we have then a total of 4,000 turns and a resistance of 41 ohms. When a common return or grounded system is employed, even if less wire is used on the ringer coils, it would prove more effective as a safeguard against burnouts. It would not, however, be good practice to install a magneto ringer which does not at all times respond to a generator current through a non-inductive resistance of much less than 7,000 ohms. With the current generated by the magneto generator described in a preceding section it is possible to make the ringer armature A (Fig. 6) respond to an impulse of current over 20,000 ohms of non inductive resistance.

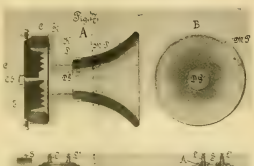
The receiver supporting hook C C (Fig. 2) is an automatic switching device, operated by the weight of the receiver and the connecting spring S. Normally, that is, with the receiver on the hook, the line circuit is closed through the call receiver and around the shunt wire of the call transmitter C T. Upon removing the receiver the counter spring S forces the hook up and in contact with two springs B and B T, closing respectively the battery circuit through the microphone and the primary winding of the induction coil and the line circuit through the secondary winding in series with the speech receiver S R.

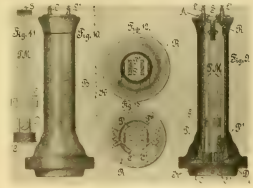
The movable parts of a telephone hook should be made fairly rigid, for when it is considered that the switch must perform its functions always, though exposed to the probable abuse of the sometimes wrathy telephone user, it will be understood why some of the samples submitted herewith do not always appear presentable, especially after cutting in a line bristling with wrath-producing things.

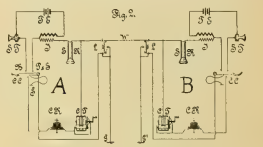
The speech transmitter or microphone S T shown in Fig. 7 is of the simplest type imaginable. The hard rubber cup C supports a carbon electrode E. The metal cap K, fining over the cup C at R, holds in place the carbon diaphragm D. The variable resistance material, carbon, is maintained in a loose or divided state between the electrodes E and D.

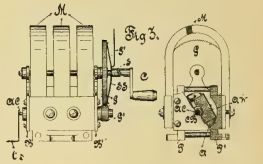
In the construction of a microphone the object is

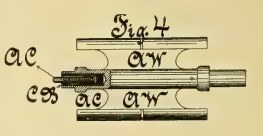


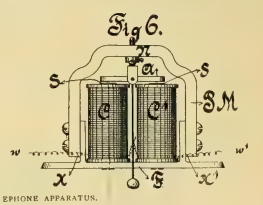












ART OF CONSTRUCTING TELEPHONE APPARATUS.

with a given air disturbance to obtain the largest possible variation in the amount of current passing through the primary winding of the induction coil. The microphone in response to air vibrations acts as a rheostat in series with the primary winding and the battery T E.

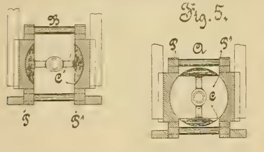
Lack of time will not permit of a very lengthy description of the microphone. Let it suffice, therefore, to say that after once you have succeeded in constructing a good talking microphone let well enough alone, and rather than attempt to make a different instrument devote your spare time to improving the little unknown details of the good talker, and above all remember that the least change in either construction or kind of material employed may mean the undoing of all former efforts and the loss of a one-time good talking transmitter.

The induction coil consists of three essential parts: the iron core, the primary winding and the secondary winding. The iron core should be constructed from thoroughly annealed iron wire about 20 mils in thickness. A somewhat smaller wire might be more desirable were it not for the difficulty experienced in handling much smaller wires. The primary winding of an induction coil should consist

[1] Read before the Chicago Electrical Association January 21 1898.

of no more than three layers of single silk-insulated copper wire, and that only on coils less than two inches in length.

There is, however, no fixed rule regarding the number of layers actually required, for the kind of microphone and battery employed will generally help to determine the proper proportions. The secondary winding of an induction coil should be wound with no more turns of wire than are absolutely necessary to give a good secondary effect. In other words, if an induction coil having but 20 turns in the secondary winding gives you the desired service do not wind it with 10 times the number of turns merely for the sake of appearance.



ART OF CONSTRUCTING TELEPHONE APPARATUS.

As stated, the proper dimensions of an induction coil must be determined with a given microphone and battery employed. Assuming, therefore, that we have a source of current with an electromotive force of three volts, also that we have a microphone constructed similar to the one shown in Fig. 8, and that it be desired to design an induction coil suitable for both local and long-distance transmission; although this paper could not begin to describe the numerous experiments performed or how the proper proportions were arrived at, the induction coil which will be described may be said to be the fruit of seemingly endless experiments made in connection with the apparatus already mentioned.

The iron core is composed of 500 strands of No. 24 B. & S. gauge Swedish iron wire four inches in length and formed into a bundle nine-sixteenths inch in diameter. Immediately surrounding the wire bundle, fitting very closely, is a fiber tube one-thirty-second inch in thickness. At both ends of the tube a square fiber head is securely fastened, for the double purpose of holding the primary and secondary wire in place and to allow fastening the completed coil to the proper support.

The primary winding consists of 200 turns of single silk covered magnet wire 32 mils in diameter wound in two layers to a resistance of .038 ohm. After covering with several layers of waxed paper the wire thus wound, the secondary winding consisting of 1,400 parallel turns of single silk covered wire 6.30 mils in diameter is wound over the primary wire in seven layers to a resistance of 75 ohms. In concluding this section it might be said that a large number of coils constructed according to the foregoing specifications are in daily use, and that a demand has yet to be made which it cannot meet and prove equal to in a comparative test.

The magneto telephone, after more than 20 years of service, has yet to meet a successful rival. It has been subject of scores of patents and modifications, but somehow or other the old-fashioned horseshoe magnet with a pair of magnet coils upon its polar extremities appears to be the proper thing to place behind a kinkless diaphragm.

The hand telephone is so well known that a description of it may be made very brief, and for that reason the author selected for illustration a receiver which he has good cause to believe was made [illegible] spectively show a top and bottom view of the receiver with the ends removed, allowing better inspection.

Numerous statements have been made relating to the extreme sensitiveness of the telephone receiver, but the next time you figure on buying a complete telephone outfit, test the telephone in the ordinary way with the slight addition of a two-ohm non-inductive shunt coil connected in multiple with the receiver terminals. If it stands the test the instrument should give good satisfaction as a talker.

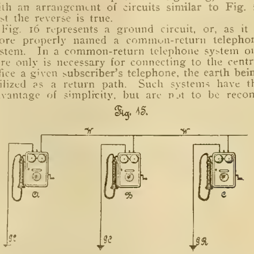
Fig. 14 represents three telephones connected in series. Although it is possible to give fairly satisfactory service with the telephones constructed as described in Figs. 3, 4, 5 and 6, it is always advisable to wind a less number of turns of wire on the ringer spools and a greater number of turns on the generator armature, the former to reduce its retardation to the voice currents and the latter to make up for the decreased sensitiveness of the magneto ringer.

Fig. 15 represents the connections of the bridged-circuit telephone, largely employed for party-line service. Whenever it is desirable to permanently connect more than two telephone instruments to one wire circuit the instruments may be connected as shown in Fig. 14, but with the properly arranged instruments connected as shown in Fig. 15, a much better talking service is had, which more than counterbalances the somewhat decreased efficiency in calling distant stations.

In explanation of this comparison it might be said that with instruments connected as shown in Fig. 14 the talking limit is reached long before the limit in distance of practical signaling, whereas with an arrangement of circuits similar to Fig. 15 just the reverse is true.

Fig. 16 represents a ground circuit, or, as it is more properly named a common-return telephone system. In a common-return telephone system one wire only is necessary for connecting to the central office a given subscriber's telephone, the earth being utilized as a return path. Such systems have the advantage of simplicity, but are not to be recommended under adverse conditions for producing a satisfactory service.

Fig. 15.



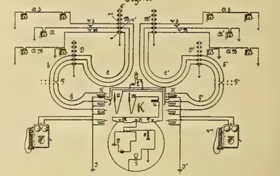
ART OF CONSTRUCTING TELEPHONE APPARATUS.

It is not within the scope of this paper to give anything like a complete description of any particular system, but for the purpose of illustrating general principles employed, the common return, as the simplest of all systems, has been selected by the author for the purpose of describing to you what details enter into the construction of an exchange system, and what constitutes the a b c's of a telephone call.

The telephones A S, A and A B represent instruments already described in another section. Assuming that a subscriber at the telephone A wishes to have his line placed in connection with the circuit connected to the telephone A S, one turn of the generator crank will be fully sufficient to throw [illegible] posite, the wave discovered and attempted to reach a ground plate quite near to both spring clips. Passing into the cable C there appeared to exist an endless rush of strange-looking waves of all sizes, some long, some short, and all were persistent in demanding a passage, resorting even to traveling in an entirely unprofessional manner on circuits belonging to others. Confusion reigned supreme. The motto was "Everyone for himself and induction for us all."

On emerging from the cable C at D the heat

Fig. 16.

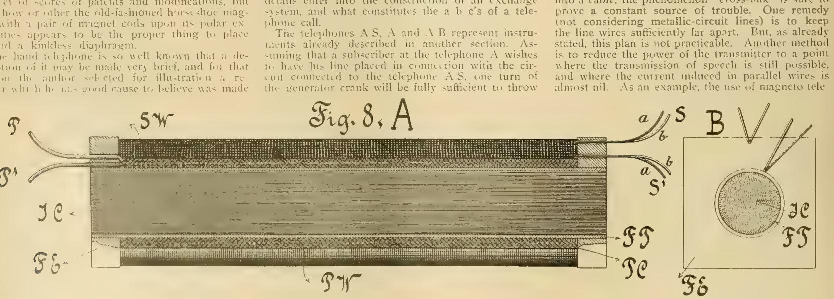


ART OF CONSTRUCTING TELEPHONE APPARATUS.

coil was passed without a struggle. Rushing through the cable E the now somewhat flattened wave received a severe jolt while effecting a passage through the distributing board F. However, with a last and supreme effort the wave performed its mission by passing through the wire of the annunciator magnet H, and over the earth wire I back to its source, the telephone A.

For the purpose of a more extensive description we will follow the path as outlined by the current wave. The telephone A and the line wire W it will not be necessary to further describe. At the point B there is placed on the cable pole a waterproof box containing the terminal end of the cable C, a lightning arrester strip b' and the spring clip terminals w w' and c c', which are connected together by means of fusible wire W C. The wire of which the cable C is constructed will not, as a general rule, safely carry more than five amperes of current. Therefore if any outside telephone wire accidentally comes in contact with a wire charged with a sufficiently high difference of potential the fuse wire W C must open the circuit and protect the cable wire against the passage of more than five amperes of current. Bear in mind, however, that it is the cable wire and not the wire on the annunciator drop we are protecting.

Regarding the cable C, nothing of much importance can be said outside of that which the "much troubled" wave called unprofessional traveling, by which it is meant to say that both ringing and voice currents passing over certain wires cause an induced current to travel in all wires lying closest to itself. The voice currents, however, most seriously affect single-wire telephone systems, for as it is at times impossible to install an exchange system without the use of at least some wires formed into a cable, the phenomenon "cross-talk" is sure to prove a constant source of trouble. One remedy (not considering metallic-circuit lines) is to keep the line wires sufficiently far apart. But, as already stated, this plan is not practicable. Another method is to reduce the power of the transmitter to a point where the transmission of speech is still possible, and where the current induced in parallel wires is almost nil. As an example, the use of magneto tele-



ART OF CONSTRUCTING TELEPHONE APPARATUS.

in Germany. [illegible] it will be seen that the [illegible] P M [illegible] arranged with the soft [illegible] which support the wire [illegible] diaphragm D is securely [illegible] pole pieces by means of the threaded [illegible] at the same time answering [illegible] A the upper [illegible] the screws so fastened by [illegible] the metal plate M that [illegible] proper direction will [illegible] cede from or approach the diaphragm D.

Fig. 11 shows [illegible] receiver, and Fig. 12 [illegible] pearance of the magnet [illegible] the central office annunciator drop, his wants are made known and—but not quite so fast; we will capture and interview the first current wave arriving at the annunciator drop H, and learn from it a few necessary facts. After leaving the generator armature of the telephone instrument A, the wave discovered that the magnet ringer coils offered some objections to its free passage, but barring a slight rounding off of its edges no serious damage was done. Continuing the journey over a comparatively smooth road, the line wire, the wave reached the point B. At this point scores of wires terminated on small spring clips.

While passing over a short piece of very small German silver wire to a spring clip directly op- phones alone on almost any kind of system produces but little if any cross talk at all, which is due, of course, to the extreme smallness of the current transmitted.

The annunciator, or rather the switchboard drop H, is wound in 24 layers with about 3 500 turns of No. 31 B. & S. gauge single silk covered copper wire to a resistance of 75 ohms. If a current of one fourth ampere be allowed to pass through the coil for more than five minutes in succession the insulation would become charred if not actually burnt. In a previous reference the fusible cut-out is described as allowing a maximum current of five amperes to flow. It would, therefore, be of little use as a protecting agent for a wire

coil, that will not safely carry over 150 mil-amperes of current.

A little device, however, placed at the point D serves to protect the switchboard drop H against the passage of a dangerous current. The heat coil, or, as it is more properly named, the sneak-current arrester, is composed of a few feet of very small German silver wire, wound and so placed in relation to a fusible piece of metal, that the passage through the wire of a given current for a certain length of time will generate a sufficiently high degree of heat for melting the fusible metal, which, when effected, completely severs the drop connection from the line wire. However, the cable C also must be protected against the probable damage a highly charged though open wire might produce; therefore at the instant that the fusible metal of the sneak-current arrester opens the circuit, a spring normally under tension forces a terminal of the charged wire into contact with a ground connection, this action by causing an increased flow of current through the cable wire fuses the wire W C, thus leaving the cable entirely free from dangerously charged wires.

The disributing board F is, as its name implies, an arrangement for enabling the proper distribution of wires. When a newly established telephone exchange commences to operate, it is more than likely that the respective numbers usually given each telephone subscriber have been selected by the exchange manager himself, therefore at the very beginning a distributing board might appear to be a needless expense. However, after a short while it is found that John Jones, telephone No. 25, desires to remove his instrument to another part of the city, and that it will be necessary to connect the No. 25 telephone through another line circuit; a change of the telephone's number would be out of the question; therefore the distributing board is a convenience, if not almost an absolute necessity, for exchanges having over, say, 500 line connections.

A subscriber at the telephone A while transmitting a call causes the drop H to release its shutter, which in turn closes a local circuit at J, which by means of the bell L informs the operator K that a call has been made. The operator K now inserts the plug M into the line-jack H. Placing to her ear the receiver O and pressing the button N, she speaks into the transmitter P, perhaps "Number, please?" receiving in response, "Give me A S'." The plug Q is inserted into the jack H', and on pressing the button R the calling current is transmitted by means of the generator S over the cable wire G' and over the line wire W S actuating the magneto ringers contained in the telephones A S', thereby giving the usual ring. If while waiting for an answer from A S', the subscriber A should step away from the telephone and therefore require a recalling signal, the operator merely depresses the button T, thus causing a signal to be made at the telephone A. After the conversation either A or A S', on giving their generator armatures a few turns, throw the clearing out drop U, the operator again depresses the button N, and on receiving no response to her inquiry as to whether the subscribers are through, she would remove the plugs Q and M from the jacks H and H', and thereby restore to a normal position that particular set of cords.

American Electric Fuse Company.

In June, 1895, C. E. Brown and F. W. Maxstadt conceived the idea that the telephone and other electrical business of the United States and foreign countries was advancing at such a rapid rate that it was drifting into a vast and gigantic manufacturing industry, and that in this new and wonderful field in telephone, telegraph and electrical specialties

F. W. Maxstadt

C. E. Brown

AMERICAN ELECTRIC FUSE COMPANY.

there was a splendid opportunity in the manufacture of telephone and telegraph fuse and fusible cut-outs, telephone and telegraph lightning arresters and joints for telephone and telegraph wires, forming a solid mass of copper at the joint. Since the beginning of the manufacture of these specialties the American Electric Fuse company has branched out in the manufacture of similar fuses and fuse links for electric light and power circuits, and Messrs. Brown and Maxstadt have just completed negotiations with the owner of one of the largest manufacturing blocks in the city of Chicago for a factory on the 1st of March.

The following sketch of the gentlemen who are responsible for the development of this enterprise cannot fail to be of interest:

Clarence E. Brown was born in the city of Chicago in August, 1855, and received his education in the Scammon High School, after which he embarked with his father and brothers in the printing business, his father being the proprietor of one of the first Chicago papers, called the Chicago Express, which was merged into the Chicago Evening Journal. This fact may explain one element of Mr. Brown's success, his belief in advertising and his ability to recognize and appreciate the value of advertising broadcast in reliable and honest journals. Mr. Brown is now giving his entire attention and time to the financial part of the American Electric Fuse company, of which he is secretary and treasurer. He possesses a genial disposition, and he takes great pride in announcing to his friends that the American Electric Fuse company owes no one a penny.

F. W. Maxstadt was born at Albany, N. Y., in August, 1858, and was compelled to seek a position at a very early age, to help support his younger sisters and brothers and thus relieve his widowed mother. He learned the trade of machinist, and came West. After traveling through the entire western portion of the United States, Mexico and Canada, and operating mining machinery and electrical devices throughout the western portion of the United States, he returned to Chicago to take charge as chief engineer of the Western Union Telegraph company's headquarters at Chicago. After completing and operating the Western Union dynamo power plant for the western system of the Western Union Telegraph company, he turned his attention to the invention of electrical specialties

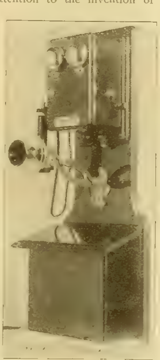


Fig. 1.

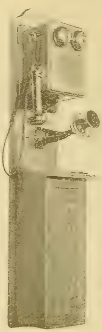

Fig. 2.

STANDARD TELEPHONE AND ELECTRIC COMPANY.

for the protection of telephone and telegraph circuits, until the demand increased to such an extent that he was compelled to give up his position as chief engineer for the Western Union Telegraph company, in order to do justice to the manufacturing of his electrical specialties. Mr. Maxstadt formed the corporation of the American Electric Fuse company, with Mr. Brown, in June, 1895, and since that time he has devoted his entire attention to inventing, designing and superintending the construction of the devices manufactured by the American Electric Fuse company, of which he is the president and general manager. Mr. Maxstadt is now giving his entire attention to new designs of fuse wire machinery for the manufacture of special fuse links and fuse wire.

Standard Telephone and Electric Company.

The history of the Standard Telephone and Electric company of Madison, Wis., explains the popularity of that concern in the independent field. Its product has been on the market since October, 1894, with a record of sales and satisfactory output to customers uniformly flattering from the first. In the state of Wisconsin alone the Standard company has equipped over 45 exchanges with complete apparatus.

The pioneer work of the Standard company was throughout the extreme Northwest, with headquarters at Minneapolis. Six months later the company was incorporated under the laws of the state of Wisconsin and thoroughly organized, with general offices at Madison. Among its promoters may be mentioned as one of its most efficient officers, E. W. Batchelder, its secretary, who has been actively interested in every move the company has made since its organization. Mr. Batchelder has been for nearly 30 years connected with telegraph and railroad affairs, and served for many years as operator, train-dispatcher and superintendent for the Chicago, Milwaukee and St. Paul and the Great Northern Railroad companies, engaging in telephone work in 1894 because of the inviting future presented in consequence of the expiration of the Bell company's monopoly. To Mr. Batchelder's efforts and close attention to the company's interest much of its success is due. His large acquaintance among a class of progressive men who knew his worth has led to the building up of a very substantial and reliable business in railroad and telegraph circles alone. His friends are legion, and his sterling qualities as a business man and personal friend are fully appreciated by those who are fortunate enough to know him.

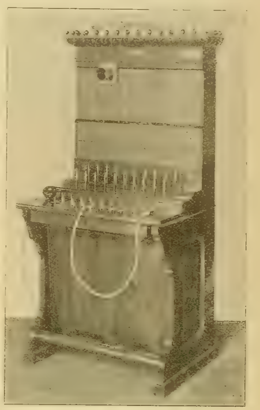

FIG 3. STANDARD TELEPHONE AND ELECTRIC COMPANY.

With the reorganization of the company and location at Madison, its financial and operative policy has been directed by its president, the Hon. P. L. Spooner, its treasurer, the Hon. H. A. Taylor, and a board of directors composed of men of affairs and of national prominence, whose interests have been largely located in Wisconsin for years.

Over two years ago the company found that it required to complete its personnel someone well acquainted in telephone circles—a man whose experience, ability and character would add to the company's standing and enable it to intelligently handle a rapidly growing business. J. J. Nate of Chicago was secured to co-operate with the officers of the company in its earlier work and later appointed general manager in full charge.

Recently the company has gotten out several new instruments. One of these is the Standard special No. 80 long-distance telephone, Fig. 1. It is symmetrical and has efficient adjustable arms. The Standard telephone set No. 13, Fig. 2, is designed to meet the ideas of those who want an arrangement by which batteries are placed one above the other in preference to the style of wide battery box in ordinary use. A new and improved double-pole receiver has been designed more particularly for long-distance service. A power generator, differing somewhat from the ordinary form in bearings for contacts, is another recent addition. One-fourth inch copper brushes are used bearing on two metal wheels having a diameter of an inch and a half. A switchboard of special construction, known as the Standard No. 99, is shown in Fig. 3. This board has a uniform height of 4½ feet over all, and is furnished with from 90 to 180 numbers inclusive, a 90-number section having a width of 27 inches, while the 180-number requires a total width of only 54 inches, from which it is evident that 180 numbers are all readily within the reach of one operator. The board is furnished in four sizes, of 90, 120, 150 and 180 numbers each, the width increasing from 27 inches up to 54 inches, according to capacity, and is fully equipped with operative apparatus of new and novel design. An entirely new switchboard is now practically ready for the market, combining the many features of novelty and merit claimed for self-restoring drop and ring-off combination switchboards.

The Indiana Rubber and Insulated Wire company of Jonesboro, Ind., is enjoying a very satisfactory business. Mr. A. F. Seiberling, the superintendent of the company, has just returned from the East, where he purchased a quantity of new cabling machinery, insulators and braiding machines. This new equipment will enable the company to increase its output about one-fourth. The general outlook for business is excellent.

Proposed Standard Diagrams of Electrical Apparatus.[1]

The time has arrived when the diagrammatic illustration of electrical apparatus should be reduced to an art. A uniform code should be established containing a diagram for each piece of apparatus, each diagram being at once simple and, so far as possible, suggestive of the particular piece of apparatus which it is designed to represent.

A decided improvement has been made in this direction during the last few years, yet at the present time the system is far from perfect. Its development has suffered through a lack of unity among the various makers of these diagrams.

The electrical divisions in the Patent Office have done more toward the development of this art than any other one agency. Often in a drawing accompanying an application for a patent, when a circle was used to represent a battery, and another circle exactly like it to represent a dynamo, and still another, differing in no respect, representing the ground, the drawing was necessarily confusing, and for the most part, self-explanatory, and, we think, need no comment. The representation of a dynamo or motor by a circle with two tangent lines showing the commutator and two brushes has long been in common use. This form of diagram may be used for any direct-current machine in drawings where the form of the winding of the machine is either well understood or is not essential in the system to be represented. Similarly, the figure below it may be considered the generic alternator. Where it is necessary to show particularly the kind of a machine, the field coils may be added, as shown in the next three figures, which are so simple that they cannot be misunderstood by one accustomed to read electrical diagrams. The diagrams of the tri-phase dynamos or motors are shown by the characteristic windings of their armatures only. Where there is room for a doubt as to whether one of these diagrams represents a motor or a dynamo, a letter M or G, as the case may be, will clearly distinguish them.

The diagram representing the motor-generator will, perhaps, be subject to adverse criticism. In its adoption, good perspective is undoubtedly sacrificed for ease in drawing, but who can say that the diagram is not suggestive of what it is intended to represent?

The differentiation of the diagrams for the primary battery and for the storage battery from each other and from the ordinary diagram for a condenser, has been the subject of a good deal of thought. The primary-battery diagram is the one in ordinary use. The storage-battery diagram differs from it by having the plates connected in multiple, as in practice, and by the drawing of a square around it. This diagram will hardly be taken as representing a condenser, for the reason that the lines representing the plates of the battery are made thicker than those connecting the plates to the battery terminals.

The reason for not representing the ordinary hand magneto-generator and the constantly driven generator by the same diagram is that a need actually exists for distinction between them. This is especially so in diagrams of telephone exchange systems, where it is often difficult to distinguish between the hand generators at the subscribers' stations and the power generators at the central office.

The electrical measuring instruments need no comment, we think, owing to their extreme simplicity and the unmistakable evidence which they bear to their identity.

In the matter of single and double-circuit breakers, many forms of diagrams were considered, each of which would probably have its advantages in certain places. This brings out well the fact that these diagrams must be taken merely as a guide, and not as a rigid code which must be absolutely followed. For instance, if it were essential that the circuit-breaker should have an operating coil in each of the line wires, then it must be left to the designer or illustrator to make his own diagram for illustrating the particular case in hand.

On the simple telephone diagrams but little comment is needed. It would be well if all would adopt the form of transmitter shown, from the fact that its construction is so extremely simple.

The listening and ringing key for telephone switchboards is a simple representation of one of these pieces of apparatus in common use. The remarks made concerning the cut-outs will apply with equal force to these.

Two diagrams for polarized bells have been

PROPOSED STANDARD DIAGRAMS OF ELECTRICAL APPARATUS.

The differentiation of the diagrams for the primary battery and for the storage battery from each other and from the ordinary diagram for a condenser, has been the subject of a good deal of thought. The primary-battery diagram is the one in ordinary use. The storage-battery diagram differs from it by having the plates connected in multiple, as in practice, and by the drawing of a square around it. This diagram will hardly be taken as representing a condenser, for the reason that the lines representing the plates of the battery are made thicker than those connecting the plates to the battery terminals.

The reason for not representing the ordinary hand magneto-generator and the constantly driven generator by the same diagram is that a need actually exists for distinction between them. This is especially so in diagrams of telephone exchange systems, where it is often difficult to distinguish between the hand generators at the subscribers' stations and the power generators at the central office.

The electrical measuring instruments need no comment, we think, owing to their extreme simplicity and the unmistakable evidence which they bear to their identity.

In the matter of single and double-circuit breakers, many forms of diagrams were considered, each of which would probably have its advantages in certain places. This brings out well the fact that these diagrams must be taken merely as a guide, and not as a rigid code which must be absolutely followed. For instance, if it were essential that the circuit-breaker should have an operating coil in each of the line wires, then it must be left to the designer or illustrator to make his own diagram for illustrating the particular case in hand.

On the simple telephone diagrams but little comment is needed. It would be well if all would adopt the form of transmitter shown, from the fact that its construction is so extremely simple.

The listening and ringing key for telephone switchboards is a simple representation of one of these pieces of apparatus in common use. The remarks made concerning the cut-outs will apply with equal force to these.

Two diagrams for polarized bells have been

was followed with difficulty, if at all. In such cases it has not been infrequent for the Patent Office to suggest to the inventor or his attorney that he submit a new drawing using a certain adopted form or diagram to represent his battery and another to represent his dynamo, and so on. In this way, and with the well-directed efforts of a number of patent attorneys, a great improvement has been made. These diagrams are to further assist in this direction.

It is well to state that no attempt at originality has been made in their selection. All available sources of information have been drawn from, and it has been the aim of this committee to adopt the best, regardless of whether they had been in common use or not. In deciding upon the diagram for any particular piece of apparatus the question was considered from several standpoints. Simplicity always earned the greatest consideration when several diagrams of apparently equal simplicity were to be chosen from, that one was taken which seemed most suggestive of the actual piece of apparatus represented.

The sheets of drawings attached to this report are,

[1] Report of committee of the Chicago Electrical association February 14, 1898.

its adoption, good perspective is undoubtedly sacrificed for ease in drawing, but who can say that the diagram is not suggestive of what it is intended to represent?

shown. The one on the right-hand side is preferable where its meaning cannot be mistaken. The almost universal adoption of this form of diagram has led this committee to show it here, although unless one is familiar with polarized bells in telephone work it must be said that it is not at all suggestive. In cases where it is thought best to be extremely explicit, or where the immediate context of the diagram does not suggest the use of a polarized bell, the diagram on the left is to be preferred.

The diagram for a polarized relay is, we believe, given here for the first time. By changing the plus and minus signs from one side of the armature to the other, it may be indicated that the relay will close on a minus current and open on a plus current, or vice versa. This is a feature which will be found at times very convenient.

The distinction between the ordinary resistance and inductive resistance is both simple and suggestive, the presence of the core inside of the coil conveying to the mind the presence of a certain amount of self-induction.

The use of two parallel zigzag lines for induction coils or transformers lends itself readily to the distinction between the primary and secondary, between the step-up and step-down transformers, and,

moreover, its construction is of such a simple nature that it was chosen without hesitation by this committee from among dozens of other good diagrams for representing the same apparatus.

In the telegraph sounder the magnet coil has been represented in outline. In this connection it may be said that where it is not essential to know the nature of the winding or the direction of the convolutions, this same form of magnet might be adopted in any of the relays or annunciators used elsewhere in these diagrams.

The selection of a symbol for a ground which might be universally accepted is apparent. The custom of some artists of placing palm trees and grass, or the drawing of miniature landscapes surrounding their ground wire, may add somewhat to the artistic effect, but certainly nothing to the clearness of merit of their work.

In conclusion it may be said that it is believed that where any particular piece of apparatus is to be presented for which no specific diagram is here found, it will be an easy matter for the person desiring such diagram to make it from the elements here shown.

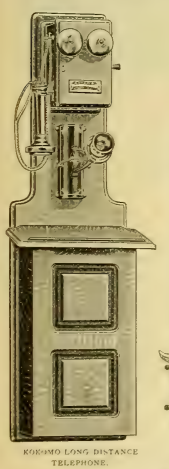
The effort of your committee has been to group acceptable conventional diagrams in a convenient form, and in carrying out the instructions of the Chicago Electrical association we bring to a focus a matter which has been under discussion for several years.

By the official adoption of these diagrams by a recognized body of electrical men, a standard of uniformity is presented to the public. The committee realizes that this list is not complete, but hopes that it will be a nucleus of a uniform symbolic language among electricians.

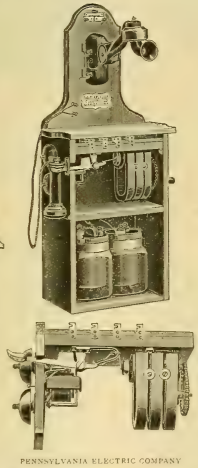
From time to time, as suggestions may be offered, suitable additions can easily be made to our present selections.

Kokomo Long-distance Telephone.

Of the telephone herewith illustrated the Kokomo Telephone and Electric Manufacturing company of Kokomo, Ind., speaks with positive assurance. This instrument is fitted with a Kokomo long-distance transmitter, four cells of battery, adjustable iron arm for transmitter, quarter-sawed white oak woodwork, and is equipped with an automatic lightning arrester. The transmitter used on this telephone was patented November 17, 1896. The telephone is in use on a government line in the West with great satisfaction. The Kokomo company claims that it has never failed and that it is the best long-distance telephone on the market.



KOKOMO LONG DISTANCE TELEPHONE.



PENNSYLVANIA ELECTRIC COMPANY

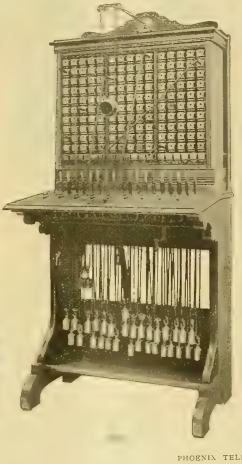
Pennsylvania Electric Company.

The Pennsylvania Electric company of Marietta occupies a large and well-equipped plant, including iron and brass foundries, machine and cabinet shops, testing room and dynamo plant with 110, 220 and 500-volt direct-current machines for testing and lighting purposes, coiling rooms and an especially fitted transmitter room. The buildings occupy a floor space of over 50,000 square feet on 10 acres of ground, in which there are ample side tracks of the Pennsylvania Railroad company. Lumber yard, coal, coke and iron bins, all of which are arranged with a view to convenience and economy in the operation of the plant. The apparatus is of high grade in material, workman ship and efficiency. The company is making a feature of its Crescent Ideal telephone, which is illustrated herewith. It will be seen that the movement of the magneto-bell is arranged in an entirely new and novel manner. The working parts are all mounted in such a way that they are easily detachable from the cabinet for purposes of inspection and repairs, and just as easily and quickly replaced. The electrical connection is made through large brass surface plates with machine screws instead of through binding-posts. The same type of instrument for series work is made in two styles, viz., the three-magnet, 10,000 ohms outfit, for exchange work or ordinary private-line and toll-line work, and the four-magnet, 30,000 ohms outfit, for toll-lines and severe long-distance series work. Bridging telephones are also put up in the same cabinet, which, with the improved transmitter material used by this company, are the inventions of Manager Bossart.

The transmitter is different not only in the material used, but the process of treating as well. The resistance in the primary circuit of the induction coil, through the transmitter movement, is reduced 50 per cent., and the sound volume and clear articulation are increased.

Phœnix Telephone Apparatus.

The Phœnix Electric Telephone company of 93 Washington street, New York, has recently made important improvements in its apparatus. The company occupies a five-story building and has a complete plant, including everything necessary for the accurate manufacture of each individual part. No factory in the United States can boast a more complete system. An accurate record is kept of each different operation during the process of manufacture, and each workman is individually responsible for every piece he handles. There are five departments, each under the supervision of a competent foreman skilled in his particular branch and all under the eye of a superintendent. Each workman receives so much raw material, with its accompanying card, which follows it through every operation and which, when it has finished its journey through the many different operations, must bear the inspection marks of each foreman through whose department it has passed, as well as the signature of the superintendent, before it passes into the storeroom to be again passed out to the assembling department.



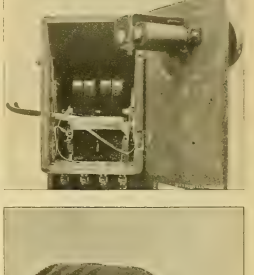
PHOENIX TELEPHONE APPARATUS.

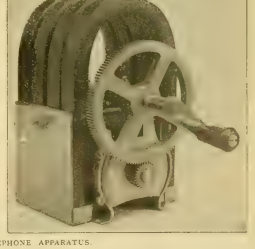
The new magnet generator recently put on the market by this company is made on the punch press, not a single casting being employed. This insures accuracy and make all parts interchangeable. The armature is laminated, being built up of 21 separate pieces, which prevents Foucault currents and gives a much greater efficiency. The large gear wheel has one-quarter inch face and is stamped from a solid piece of metal and is absolutely true and noiseless. The automatic cut-out is positive in its action. It has four bars of the best magnet steel. The cuts show the gears and automatic cut-out. The Sutton microphone has already earned for itself an enviable reputation. It will not lose its adjustment and never packs. The cut shows a cross-section of this microphone. The receivers manufactured by this company are of the standard pattern with powerful compound magnets of the best quality of magnet steel. The bobbins are silk wound and the core is nickel-plated to prevent rust interfering with the action of the diaphragm. In this company's long-distance exchange instrument (style No. 9) are embodied the up-to-date improvements in the art, as shown in cut. Should the transmitter be damaged, a set-screw removes it. Should the magneto be burned out, remove three wood screws and the entire magneto box comes off. Should the coil be damaged, a few screw turns and the entire arm and base come off. In fact any part of the telephone can be taken off without cutting a wire or removing the instrument from the wall.

The switchboards manufactured by this company are of the new self-restoring drop pattern. An illustration is presented of one of 150 drops. The magnets are double and are wound for the most exacting service. There are no operator's plugs, and the connection is made with but two movements, making it an exceptionally quick operating board. The case containing the magnets swings out on hinges and the table containing the operating keys also lifts up, thus making it very easy to get at all parts without disturbing any of the line wires. Every board is set up, carefully tested and operated before shipment. Switchboards and telephones are sold by this company, subject to approval.

Telephone Magnets.

The Varley Duplex Magnet company has for five years spared no expense in perfecting nearly every type of magnet, and especially is this true in the case of telephone magnets. Richard Varley, the president of the Varley company, has an interesting museum containing hundreds of types of telephone induction coils, no two coils being exactly alike. The gradual development of the induction coil for telephone and other purposes is here aptly illustrated. Some 50 odd types of telephone drop magnets and as many styles of series ringer magnets, wound with all sizes of wire, from 29 to 33 inclusive, are to be found in the collection.





Drop magnets show the most rapid advancement. The limiting dimensions of the spool being first determined upon to accommodate a given number of turns with a given size of wire, the magnet is handed over to the switchboard superintendent, who takes all sorts of privileges with the core iron to accommodate and support various fingers, triggers, springs, shutters and everything mechanical to make the switchboard work rapid. In regard to differentially wound coils, Mr. Varley claims that there is not so much call for this style of coil as there is abroad.

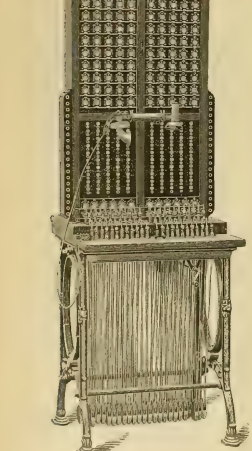
In the latest achievement in this line some marvels in magnet winding may be seen—magnets with one, two, three and as many as six wires, all wound on the spool automatically and simultaneously. In the case of a plain differentially wound coil the two halves are wound at the same time, and when the magnet is finished each wire has exactly the same turns and resistance, and, what is most desired, the insulation resistance between each

winding is so high that no deflection is obtained when testing for insulation resistance with a Thomson reflecting galvanometer having a constant of 45,000 megohms. This is due to the two windings being entirely separate, although occupying the same relative positions over a common core.

In the ordinary differential wound coil the insulation resistance varies inversely with the length of the two wires that are wound together; hence, in two similar sized differential coils of 50 and 500 ohms resistance wound with No. 30 and No. 35 wire respectively, the insulation resistance would be as 3 is to 1 in favor of the 50-ohm coil (two windings of 25 ohms each) and the actual insulation resistance would average anywhere from 20 to 50 megohms under favorable conditions, whereas in the double-compartment winding no difference exists between the insulation resistances of the two coils, the resistance being too high to measure by ordinary deflection method.

New Telephone Company.

The Ericsson Telephone company was organized a few days since in New York to succeed the firm of Smith & Patterson, who, for the last five years, have been importing Ericsson's Swedish telephones. These goods have been sold in all parts of the



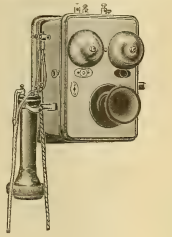
NEW TELEPHONE COMPANY.

United States and have been adopted by quite a few of the European governments. The generator is built on mechanical ideas and is the only one with an adjustment so that it can always be made to run true. The cut shows an operator's headgear, receiver and breastplate combined. The total weight is less than the ordinary headgear. One very important point is that the operator cannot get away from the transmitter, and is necessarily compelled to talk into it on all occasions, thereby rendering better service to the subscriber. The company will import all sizes of switchboard. It recently equipped an exchange with 10,000 drop switchboard. The Ericsson 1898 receiver has a powerful adjustable receiver, and requires no adjustment. The company has also brought out an improved [illegible] a main matter for long distance conversations, and guarantees perfect service on one cell only. At the same time, will guarantee that it will be used with 10 cells of the strongest battery known without injury. The domestic telephone equipped with the Ericsson imported transmitter will be manufactured in six different styles, each of the standard as well as the long distance [illegible] complete line of intercommunicating [illegible] has also been developed. The company will hereafter carry a complete stock of the imported goods in New York at all times, [illegible] other house promptness than heretofore. It will also be in position to deliver, from any of the distributing points, domestic or imported goods.

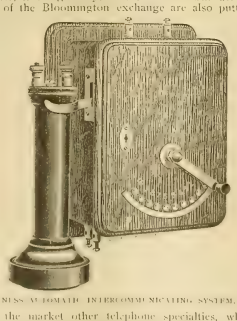
J. W. Thomson, Jr., & Co.'s Specialties.

Among the numerous independent telephone exchanges installed during the last three years the one at Bloomington, Ind., is a radical departure from common practice. The telephones in use were designed to abolish the gravity hook. There is no switch in the box. The connections run through from one binding-post to the other, soldered at the joints; there are no induction coils, no local circuit or local battery in the instruments. The battery is placed at the central station, and it has been found that the concentrated battery needs very little attention. At this time there are 262 telephones in actual use, and the current for the entire system is furnished by 144 Leclanché cells. These results are made possible by the use of the transmitter of J. W. Thomson, Jr. It is connected directly in the circuit, and the line is charged by the battery at "Central." One unlooked-for advantage that has developed from three years of experience of the Bloomington Telephone company in the use of this system is the total immunity from damage or burn outs by lightning or electric-light contacts. No damage has ever resulted from these causes, which fact is attributed to the high resistance of the transmitter, it being always in the circuit. The designers of the Bloomington exchange are also putting on the market other telephone specialties, which owe their merit to the Thomson transmitter. Prominent among these is the kitchen call box or one-way telephone. This little instrument consists of a transmitter, receiver, gravity hook and push-button, neatly assembled in a small box, without battery, induction coil or bell. From 10 to 20 of these little telephones can be placed on one wire and connected with one drop on the switchboard, as shown by the diagram. The idea is to place them in resident districts at a low rental. Such arrangement would afford telephone service to a new class of customers who are not subscribers for the regular telephones. Their introduction in exchanges is intended to increase the revenue by securing a class of subscribers that could not otherwise be obtained, and to make a demand by business and professional people for the regular telephone in order to secure the business coming from that class of subscribers. Another specialty is the interior telephone system, also with an isolated battery, which may be set up in any convenient place and connected to the battery wire of the system. No spring contacts switches are used. The wiring is simple, consisting of one circuit, soldered throughout. The only loose or removable connection in the instrument is a calling plug, attached to a cord, which may be left in any position after using until again needed.

NEW TELEPHONE COMPANY.—OPERATOR'S OUTFIT.



J. W. THOMSON, JR., & CO.'S SPECIALTIES.



NESS AUTOMATIC INTERCOMMUNICATING SYSTEM.

Ness Automatic Intercommunicating Switch.

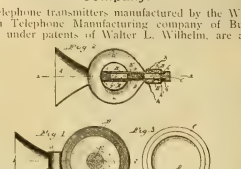
Among the labor-saving devices of the nineteenth century may well be placed the intercommunicating telephone. What a saving of time and how convenient it is to be able to call up instantly, without even the assistance of a central operator, any department in a large establishment!

WALTER L. WILHELM.

There are many forms of interior or intercommunicating telephones, but the great drawback to their universal use has been due in a large measure to the trouble experienced through the use of the manual switch employed to connect the various stations. It has been recognized that an automatic switch which would return to its normal point when a conversation was finished was absolutely necessary. The Ness automatic switch was consequently designed. The lever of this switch is simply turned around until it rests upon the switch point of instrument it is desired to call, a slight pressure upon it then rings up the person wanted, and when through talking the replacing of receiver upon the hook causes the switch to fly back to its own point, with no possibility of leaving the switch out of position for a call. This device, which is fully covered by broad patents, is manufactured by the Holtzer-Cabot Electric company of Brookline, Mass.

Wilhelm Telephone Manufacturing Company.

Telephone transmitters manufactured by the Wilhelm Telephone Manufacturing company of Buffalo, under patents of Walter L. Wilhelm, are attracting considerable attention, especially in Buffalo, Toronto, Philadelphia and Elmira, where they have been tested.



WILHELM TELEPHONE MANUFACTUOING COMPANY.

Mr. Wilhelm, the inventor of this system, is young in years, as his portrait, herewith presented, indicates, but he has had valuable experience and his inventions have attracted considerable attention.

The telephone transmitter which the Wilhelm company is now manufacturing belongs to that class of telephone microphones or transmitters which contain two separate diaphragms bearing against opposite sides of the same electrode and a single mouthpiece from which the sound is delivered by

two branch tubes against both diaphragms. The object of the invention is to produce a transmitter of this character which is extremely simple and inexpensive in construction and which can be easily assembled and adjusted. Referring to the accompanying diagram, A represents a mouthpiece, and a a two branch tubes or passages connected at their front ends with the rear end of the mouthpiece. B B represent two vertical supporting disks, secured to the open rear ends of the branch tubes and arranged parallel. The transmitting device is constructed as follows: C represents a rotary supporting ring provided on opposite sides with annular shoulders or seats c c, D D represent two diaphragms, which may be made of sheet carbon. E represents the electrode arranged between the diaphragms and bearing against the central portions of both diaphragms. The granular electrode is confined by a retaining ring F, which fills the space between the electrode and the supporting frame, and is composed of any suitable fibrous material which is sufficiently dense to prevent the powdered carbon from being displaced by creeping between the fibers, and which is sufficiently elastic or yielding to permit the diaphragms to vibrate freely for influencing the electrode. G represents packing-rings arranged between the supporting disks and the marginal portions of the diaphragms, whereby the latter are held in place. H H represent two contact springs which form the terminals of the conducting wires h h, and which are adapted to make connection with the carbon diaphragms when the transmitting device is in its operative position.

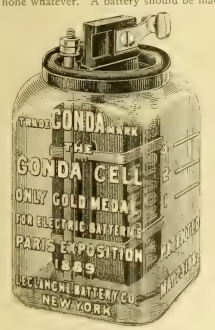
The vibrations produced by speaking into the mouthpiece are delivered by the branch tubes against the outer sides of both diaphragms, and the latter simultaneously compress the granular electrode from opposite sides, thereby increasing the force of the undulations in the current which transmits the speech to the receiving instrument in which the speech is reproduced.

A modified construction of the invention comprises a pair of transmitting devices similar to that shown in Figs. 1 and 2. A transmitting device similar in every respect to the one shown in Figs. 1 and 2 is utilized in this form also.

Mr. Wilhelm is at present engaged in developing a switchboard which has been said to be novel in design and valuable in the improvements introduced.

Leclanche Battery.

It is a mistake, say the makers of the Leclanché battery, to assume that a battery is a battery, and that the less one pays for it the more is saved. "When one takes into consideration," they go on to say, "the amount of pure cussedness which can lie hidden in a cell of poor battery, the trouble such a cell can make for its owner, the injury it can do to its surroundings and the loss which its behavior can entail, it becomes apparent that the entire cost of the cell is comparatively of little consequence, and the difference in price between it and a good cell of none whatever. A battery should be made of



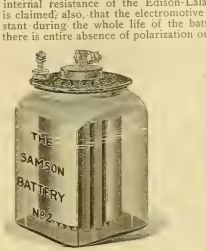
LECLANCHE BATTERY.

the purest materials by the most careful workmen and under the direction of accurate knowledge on the subject, or else it ought to be made at all. In other words, it should be the best possible, or nothing. For many years we have been trying to inculcate this axiom, and thousands have learned it never to forget it, but there are other thousands who still have it to learn and only be taught by object lessons at their own expense. Buying experience is expensive, and while it is not confined to battery purchases but is applicable to almost everything from a paper of pins to a locomotive, the practice seems to be a favorite method of wasting money with battery users. If we can save any such the cost and trouble of trying it for themselves we are glad to do so, and it is therefore not only with pleasure but with confidence that we speak of our battery, which has for more than a quarter of a century maintained its reputation in such a manner as to justify us in calling it, as we do, the standard open-circuit battery of the world. Our company is now in its twenty-seventh year of existence. The various battery cells made by us under the title of the Gonda trade-mark cells are known and used all over the civilized world, even in such remote places as China and Farther India. They were awarded the only gold medal given for batteries at the Paris exposition of 1878 and 1889 and the highest award and medal at the World's Columbian Exposition at Chicago in 1893. The Gonda trade-mark cells are so well known in this country and their reputation is so great that it is unnecessary for us to enter into a detailed description of them. We will be glad to furnish full information to anyone applying for descriptive catalogues."

The Gonda cells are made by the Leclanché Battery company of New York and are in widespread and long-continued use for telephone service. The cut shows the standard type.

Edison-Lalande Battery.

Stress is laid on the extremely low and constant internal resistance of the Edison-Lalande cell. It is claimed, also, that the electromotive force is constant during the whole life of the battery and that there is entire absence of polarization or local action.

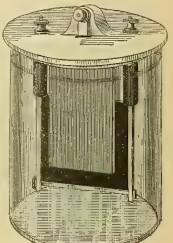


SAMSON BATTERY. Fig. 1.

The battery is light and compact and easily set up. The caustic potash for making the solution is sent out with the battery, doing away with all of the trouble and difficulty of securing pure sal ammoniac. When once the cell is set up it runs itself and very little inspection is necessary. There is, it is said, no creeping of salts, no corrosion of binding posts nor uneven eating away of the zinc, and when the cell is exhausted the operation of renewal is a very simple one.

The latest type of Edison-Lalande telephone cell (type X) is shown in Fig. 1. The cell is a square, vitrified porcelain jar, with a partition in the middle, and is made to fit into the battery box under the telephone transmitter.

The larger type of Edison-Lalande battery (type R, Fig. 2), has been used by a large number of telephone companies throughout the country with excellent results in connection with what is known as the common battery speaking-tube installation. In this system the transmitter and telephone are directly in series. No induction coil is used, the battery power for the transmitter being furnished by special wires which are run from one set of batteries to every instrument connected with the system. The New York and New Jersey Telephone company has

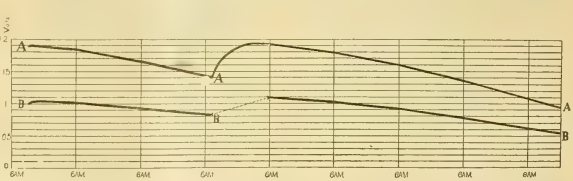


EDISON-LALANDE BATTERY. Fig. 2.

The battery must have the ability to stand at rest for long periods without wasting; at the same time it must be capable of furnishing a powerful current for the periods when the telephone is in use. The Partz acid gravity battery is said to meet these requirements. Each cell has a voltage of 1.8 to 1.9; two of them give from 3.6 to 3.8 volts, which affords an ample margin for telephone work.

The Partz, it is claimed, is to all intents and purposes an open-circuit battery; will stand for months without wasting, but when in use acts like a constant-current battery, and does not weaken or polarize until after long service. When it does weaken, the addition of a small quantity of the sulphochromic salt will bring up its efficiency almost to the original form.

The diagram here shown exemplifies the rejuvenation of a Partz cell in this manner, the point of which is that until the fluid becomes saturated the power of the cell can be again and again restored by the feeding in of the salt. The diagram is the record of a test extending over 186 hours, during which the circuit was kept closed continuously except for one interval of 22 hours, when four tablespoonfuls of the salt were put into the tube. AAA shows the electromotive force curve, which started at nearly two volts, dropped in three days to 1.4, rose again during the rest to two, and at the end of the test had dropped to one volt. BBB shows the concurrent changes in the current, starting at 1.00 milliamperes and ending with .55. Both electromotive force and current could have been rehabilitated by means of the salt.



PARTZ BATTERY.

In ordinary telephone work the Partz battery lasts a year or more without changing the fluid, and when recharging becomes necessary there is no handling of acid solutions. For long-distance telephoning it has especial advantages, and gives preeminent satisfaction on lines where the telephones are used frequently for long connections.

In a somewhat similar line of work, the ringing of fire-alarm bells, it has an enviable record. The Philadelphia Paid Fire Department has had two batteries, respectively of 50 and 62 Partz cells, in use on its alarm service since 1889, in which time the zincs have been renewed only twice.

Samson Battery.

Telephone transmitters require a battery with a low internal resistance on account of the low resistance of local circuit. Telephone users, therefore, are interested in obtaining a battery with the following characteristics: First, low internal resistance; second, high and uniform electromotive force; third, economical maintenance. That the Samson battery possesses all of these is demonstrated by these statements of the manufacturers:

First—The internal resistance is .13 of an ohm.

Second—The electromotive force is 1.40 to 1.47 volts, and this voltage diminishes very slowly on hard and continuous work. A feature is its ability to regain its full power after short-circuit of considerable duration.

Third—The economy of the Samson battery will become manifest to everyone who will consider its long life and capacity for extraordinary work. While the first cost is certainly greater than that of many battery cells now in the market, it will out-

one station at Morris Plains Insane Asylum equipped for 60 instruments, and the service from this plant has been extremely satisfactory. This battery is specially adapted to this kind of work on account of its low internal resistance, thus cutting down the trouble from cross-talk.

These batteries are manufactured by the Edison Manufacturing company, New York.

Partz Battery.

The exigencies of telephone service require a combination of qualities not possessed by ordinary forms of batteries. There must be a comparatively high voltage, in order that the voltage required for the service may be had with the fewest possible cells.

last four or five such cells, it is claimed, in addition to performing the work perfectly.

The Samson carbon is manufactured in France and is composed of two parts, a fluted lower portion and a threaded top carrying the binding-post, which are baked in one piece in the kiln. This feature is unlike any other carbon and is a necessary one to obtain the best results. The lower portion is a thin-walled, fluted, hollow cylinder, made from special materials and by a special process, resulting in a quality of battery carbon which, it is said, cannot be obtained in this country. While the crude carbon is remarkably pure, great care is taken to free it from all injurious elements, such as iron and other foreign substances, which would be liable to produce local action. The carbon mixture is subjected to a special patented process, which renders this portion, after baking, exceptionally porous. The top portion is composed of an entirely different kind of carbon from that used in the lower portion, and, after being subjected to enormous pressure, is treated when the carbon is complete in a way which renders it impervious to the creeping tendency of the solution and action of the ammonia gas.

The upper and lower portions, after being formed, are properly baked in the kiln, after which the top

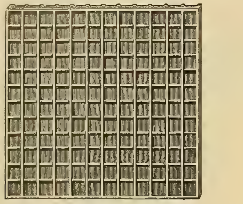


FIG. 1. HATCH STORAGE BATTERY.

of the carbon is heated redhot and plunged in hot paraffine, so that it enters into the minutest pore instead of simply collecting on the outside, as is the case with many battery carbons. The carbon made in this way has a hard, dense top and a very porous lower portion. The manufacturers state that no other carbon is made in this manner, and that it is impossible to obtain the greatest advantages when a carbon is molded in one piece.

A combination of manganese and pea carbon is placed inside the fluted portion and held in position by a specially prepared plug which will not fall out. It is this depolarizer and its close proximity to the exceptionally porous carbon which imparts to the battery its remarkable recuperative qualities. It can be easily renewed. After the depolarizer has been placed inside the carbon the connection, made of brass heavily tinned, is affixed. It is composed of large, heavy parts and includes a safety check nut.

The result of this thorough and necessarily expensive mode of manufacture is the production of a battery carbon which is claimed to have a larger surface, longer life and greater recuperative power than any other carbon element ever manufactured.

Prof. H. S. Carhart in "Primary Batteries" says: "The amount of energy held potentially in the cell is represented by the weight of the zinc." Also that the use of the small zinc rod indicates large internal resistance. The Samson zinc is of the circular form and is well amalgamated. An important improvement in the battery has been made and the elements are now joined to the top in such a manner that it is impossible to short-circuit the carbon and zinc. The carbon is held half an inch away from the bottom, and the zinc is a trifle shorter than the carbon, to avoid possible bridging of salts. The battery is "shipped set up" and having the package of sal ammoniac inside the jar. It is the first cell ever constructed embodying this desirable feature. The Samson is extensively used and carried in stock by leading supply dealers.

The Electric Gas Lighting company, Boston, Mass., is the agent in this country for the French manufacturer and will furnish pamphlets, prices and data upon application.

Gordon-Burnham Battery.

Superiority is claimed for the Gordon cell, for telephone work and other service, in that it cannot be polarized under the most severe closed circuit work until the very last ampere-hour of life is reached in the consumption of its elements, at which time it will, of course, show a diminishing electromotive force. Its commercially available electromotive force under closed conditions is claimed to be from .65 to .75 volt, although it has been known to hold this until an output of 375 ampere-hours, or 250 watt hours, has been taken from the elements contained in a 6 [illegible]. On the telephone test of .5 volt, above 500 ampere hours have been recorded. The volume of current possible is very large, and a discharge as heavy as two or three amperes on closed circuit is possible without pulling the electromotive force below a commercial point; in fact, it is said that as high as 12 amperes can be drawn.

For switchboard work the Gordon cell is especially recommended.

Compared with gravity cells the first cost of this battery is considerably higher, but it is, nevertheless, as is claimed, much cheaper in the long run, owing to longer life and higher efficiency. The Gordon-Burnham Battery company of New York, manufacturer of the Gordon cell, refers to well-authenticated tests in telephone service to prove this.

In the Gordon cell a perforated cylinder is suspended by a metal rod from a cover, and in this cylinder the black oxide of copper is placed; this copper is specially manufactured and consists of thin flakes and granules, thus offering to the excited fluid a great surface. The copper oxide as a depolarizing agent has an activity of over 15 to 1, as compared with the best gas-retort carbon found in the market at the present day. Three porcelain lugs or cleats are attached to the lower part of the cylinder, upon which rests a rolled zinc cylinder 5½ inches in diameter by 2½ inches wide, and weighing 1½ pounds, of chemically pure zinc amalgamated with mercury by a special process, which produces a practical alloy. The zinc conducts the current by means of a No. 12 copper wire riveted by copper rivet to the zinc, the connection and wire being insulated to prevent local action. The result is an internal resistance stated to be only from .04 to .06 ohm. The solution used is an alkaline one, technically termed electro-sodium, which is one of the most active electrolytes known; it is thoroughly reliable at a temperature of 25 to 30 degrees below zero Fahrenheit. The cells are manufactured in two sizes, the No. 1, or 6 by 8-inch jar, good for over 300 ampere-hours, and the No. 2, or 4½ by 6-inch jar, good for 100 ampere-hours. These results are guaranteed by the manufacturer.

Hatch Storage Battery.

The accompanying cuts illustrate the improved Hatch accumulator, made by the Hatch Storage Battery company of 53 State street, Boston. It is not claimed that the battery involves any new chemical or electrical principle, but stress is laid on the mechanical construction of the cell. Fig. 1 shows the face side of the plate, with square receptacles for the active material. This plate is of earthenware, porous and unglazed. After the plates are loaded with the lead oxide or active material, they are placed back to back, thus forming one couple. Grooves in the back of the plates admit a free circulation of the electrolyte. A series of the couples, when assembled, forms a complete element (Fig. 2). The sides of this element thus assembled are flanked with a rigid support plate of glass or similar material, and then encircled with heavy rubber bands. The

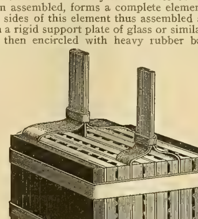

FIG. 2. HATCH STORAGE BATTERY.

electrodes are attached in any desired form, but ordinarily they are applied in the form of lead sheets, interleaved with the active material, as shown in Fig. 2.

This form of battery is of course much lighter than the "grid" type, and the cost of manufacture is claimed to be less.

The battery is recommended for central-station work and for traction, launch or carriage service. The company guarantees the maintenance of its accumulators for 10 per cent. per annum of the original cost when used for installations for large capacity, like central-station work or railway-carriage service, provided that in such cases the working of the plants is properly done and within reasonable limits.

As to the patent infringement question, Causten Browne, the eminent lawyer, has given his written opinion that the batteries described in the Hatch patents do not infringe the Brush patent.

Electrical Uses of Creosoted Wood.

The manufacture of conduits for underground wires is an important branch of electrical construction. A period of 14 years, electrically speaking, carries one back to ancient history, yet the creosoted wood conduits used in Brooklyn during that time are still in use and bid fair to remain there for a century or until electrical currents are carried without the use of wires.

Creosoted cross-arms are somewhat new on this side of the Atlantic, but the many years which the English government has used creosoted poles, cross-arms, etc, for its telegraph service have demonstrated the economy of creosoting. Creosoted arms cost more to begin with, but the total cost in the end is less, and there is less cost of maintenance and less interruption of service.

Probably the hardest competition which established electric-light and power companies have to meet is that from municipal plants. The installation of steam-heating plants to sell the exhaust steam will put electric-light companies in an advanced stage which the municipal "reformers" have not entered and make it impossible for municipal plants to produce lights as cheaply as a private company.

The Michigan Pipe company of Bay City, Mich., has supplied over 100 steam plants with steam-pipe casing, which makes the use of underground steam and hot-water pipes a commercial success. The creosoted wood conduits and other creosoted wood products are of interest to all electrical companies.

Wire for Telephone Work.

A recent visit to the factory of the Safety Insulated Wire and Cable company, Nos. 225-239 West Twenty-eighth street, New York, especially undertaken to ascertain the company's relation to the telephone industry of the United States, revealed a spacious and up-to-date insulating plant, busy in every department.

Apropos of this telephone issue of the Western Electrician, it is interesting to note that the first order received by the Safety company was dated January 29, 1888, calling for 50 miles of No. 18 B. & S. braided and twisted telephone wire for the Metropolitan (New York) Telephone company. From this initial order the Safety company has kept pace with the marvelous growth of the telephone industry, and at the present time it is said that there is not a telephone installation of any size in this country where Safety wire or cable has not been installed.

The following sizes are those principally in use by telephone companies: No. 20 B. & S., 3-32 insulation, plain, without braid, single and twisted in pairs; No. 20 B. & S., 3-32 insulation, braided, single and twisted in pairs. One conductor in the plain and braided twisted pair is colored so as to distinguish it from the other. This gauge is known as distributing-board wire. No. 19 B. & S., 3-32 insulation, plain, without braid, single and twisted in pairs, and No. 19 B. & S., 3-32 insulation, braided, single and twisted in pairs, are used for inside wire. The braided and twisted pairs of this gauge are produced in black, and in oak, cherry and mahogany, to match the woodwork in interior of buildings and residences, rendering the wire unobtrusive to the eye. A unique feature of the braided and twisted pair in this gauge is a raised marker thread running uniformly through the braid of one of the conductors, not perceptible to the eye, but of great utility to linemen, when working in dark places, and in connecting up the circuits. A workman running his finger along the twisted pair, can readily feel the raised thread on one of the conductors, thereby ascertaining what side of the circuit he is on. Such a demonstration renders testing out practically unnecessary. This feature is covered by a patent owned by the Safety company. No. 18 B. & S., 4-32 insulation, is used principally in aerial cables, which run from 1 to 51 pairs. These cables are served with jute, one layer of tape and a heavy braid, or two heavy reversed layers of tape over all.

For line purposes the Safety company makes a wire composed of No. 16 B. W. G. hard-drawn copper, braided, twisted in pairs, 5-32 and 6-32 insulation. This wire recently came into prominence by being used to connect the stranded steamship St. Paul with the New Jersey beach, and conversation was maintained throughout the five days' sleet storm (at a distance of 2,000 feet from the shore) with all points reached by the long-distance telephone. This wire has since been known as "St. Paul wire."

An important branch of the Safety company's business is its submarine department. This company is now about to lay a 5,000-foot, 10-pair telephone cable across the North River, for the New York Telephone company, and a smaller cable across from Bergen Point to Staten Island, for the New York and New Jersey Telephone company. There are over 20 such Safety cables now in use by these two telephone companies alone. The Safety company is now constructing 39 miles of submarine cable for the United States government, which is said to be the largest order for submarine cable ever placed in this country.

It must not be thought that the Safety company devotes all its output to telephone work. On the contrary, it claims to be the largest producer of rubber-covered and lead-encased underground cable for electric-light and street-railroad purposes in this country. The underground work of the Safety Insulated Wire and Cable company is represented in a large number of important contracts, and Safety underground cable has been contemporaneous with successful underground work from its early stages

down to the present day, in all the principal cities of America. Some of the company's large underground contracts are: One hundred miles of 1,000,000 circular mils rubber-covered lead-encased Safety cable for the Union Traction company of Philadelphia (this contract amounted to over $400,000); 200 miles of underground cable, Boston Electric Light company; 200 miles of underground cable, Manhattan Electric Light company, New York; 180 miles of underground cable, Mount Morris Electric Light company, New York; 500,000 feet of 211,600 up to 1,600,000 circular mils underground cable, North and West Chicago Street Railroad companies; 30 miles of underground cable, Buffalo General Electric company; 25 miles of underground cable and several submarine cables, Chicago City Railway company; 30 miles of underground cable, Public Lighting Commission, Detroit; 26 miles of underground cable, Police Department of New York.

The company has made a specialty of police and fire-alarm underground cable, and its product is exclusively in use by the Fire Department of Cincinnati, Police Department of Detroit, Police and Fire Departments of Newark, N. J., and the Police and Fire Departments of Portland, Maine. A large quantity of Safety underground cable is in use by the Fire Department of Chicago, Police Department of Boston and Boston Automatic Fire-alarm company, and orders for about $40,000 worth of Safety underground cable for the Fire Department of New York have just been received.

Safety wire and cable is used exclusively in the following new tall office buildings in New York: R. G. Dun building, Standard Oil building, St. Paul building, Syndicate building, Bowling Green building, Postal Telegraph building, Singer building and others.

It is interesting to know that in transmitting Niagara's power to Buffalo, Safety lead-encased underground cable was used exclusively wherever insulated wire and cable was required in this installation.

As an indication of the quality and durability of Safety lead-encased underground cable it may be mentioned that the Safety underground conductors used exclusively in lighting the World's Fair were subsequently used at the expositions in Atlanta, Ga., and Nashville, Tenn. Notwithstanding the drawing in and hauling out, handling and shipping incident to three distinct underground installations, this identical cable will again be put in service at the Trans-Mississippi exposition to be held at Omaha, Neb.

The enviable reputation of the Safety company and the undoubted prestige of its product have been brought about and made possible by the indefatigable efforts of its general manager, Mr. Leonard F. Requa. Mr. Requa's experience in the insulated wire and cable business dates back from the earliest stages of the art. He is a man with a large following of friends in the electrical business, and has a well-won reputation for securing large contracts for insulated wire and cable.

THE TELEPHONE TRADE.

In employing sal ammoniac for telephone use it is important that the product should be free from impurities. A. Klipstein & Co. of 122 Pearl street, New York, say of their well-known Electric brand of sal ammoniac that it is absolutely free from acid and metallic impurities, being almost chemically pure.

A concern well known to the telephone trade is the Electrose Manufacturing company, 127 North Tenth street, Brooklyn, N. Y. This company manufactures electrose telephone receiver cases, mouthpieces and other parts which have become staple articles with the trade and are now in general use, having stood the test of several years. The company also manufactures receiver caps, handles, push buttons and other electrical merchandise for the trade. All those in the market for goods of this kind will do well to get further particulars and prices from the Electrose company.

Close observers of electric woodwork cannot fail to be impressed by that turned out by the H. C. Underwood Manufacturing company of Wabash, Ind. This company manufactures all classes of special work as well as that used for telephone construction, storage batteries, etc. It does not aim to make work cheaper than anyone else, but the purchaser has the satisfaction of knowing and the quality is unequaled, always remaining in condition and showing strength and skill in construction as well as taste in design and finish. The best is the cheapest.

Mr. William Roche of 259 Greenwich street, New York, who has been for many years identified with the manufacture of dry batteries, has now a large factory at this address, although only established there for a few months. The growth of the business has been exceedingly rapid, and to such an extent that Mr. Roche has been compelled to add another floor, in the large building where he is located, to his present space in order to meet the large demand for his goods. The New Standard, which is especially made for telephone purposes, is having a large sale, while the No. 3, which is only 3¾ by 1¾ inches, not including connections, is one of the best kind of batteries that is manufactured of its class. It will fit inside of the Blake transmitter and is guaranteed by Mr. Roche to all purchasers. The fact that Mr. Roche has manufactured, during his connection with the electrical business, over 1,250,000 dry-battery cells, places him in a position to be relied upon in the production of a first-class dry battery.

The manufacture of wire properly insulated for telephone work has long been a feature in the establishment of Alfred F. Moore of Philadelphia. Having been established in 1820, this concern is now completing 78 years of practical experience in the production of insulated wire. It is one of the largest manufacturers of switchboard cords and cables, telephone cords, fine magnet wire for instruments and magnets, and wires and cables for interior telephones and intercommunicating systems. The desire for none but first-class product for use in in telephone work is now well recognized, and the years of experience which the establishment of Alfred F. Moore has had eminently fits it to guarantee purchasers none but the best material.

Charles Martin of Detroit, successor to the business of W. R. Cole, has entered the telephone field with every promise of success. He manufactured the 6,000-wire switchboard used by the Detroit Telephone company and has control of several valuable switchboard patents. His standard multiple board is capable of handling 5,000 lines of either metallic circuit or common return. He contemplates placing on the market a new 10,000-wire board that will be no larger than the 5,000-wire board, and in which it is not necessary to have two annunciators to each line, as is shown in some projected large boards. He also contemplates placing before the public a new switchboard, capable of handling 1,000 lines without the necessity of trunking or the use of the multiple board.

Edwin E. Marvin, clerk of the Circuit Court of the United States for the District of Connecticut, has given a certificate to show that, in so far as the records of the court show, the original interlocutory decree obtained by the National Conduit Manufacturing company against the Connecticut Pipe Manufacturing company on April 21, 1896, still stands in full force and effect. The decree enforced the opinion of Judge Townsend upholding the validity of the National company's patent No. 395,584. This patent was issued to Edward H. Phipps and afterward assigned to the National Conduit Manufacturing company. It is dated January 1, 1889, and relates to improvements in conduits for electric wires and cables. The Connecticut company was held to infringe this patent and a perpetual injunction was granted.

The telephone trade as well as other large purchasers of cedar poles will be interested to know that word has been received from the Kirby-Dennis company of Marinette, Wis., to the effect that it has just purchased from the Laclabell company, Laporte, Ind., 100,000 acres of cedar-pole land; also that the company has bought from the Munising company of Cleveland, O., 84,000 acres, and also from W. D. Walbridge of Washington, D. C., 5,000 acres. This land is all in Dalta, Alger and Schoolcraft counties, in the upper peninsula of Michigan. The Kirby-Dennis company further states that it has now in operation as many as 25 lumber camps devoted exclusively to its own business. It is needless to say that the company feels that with its present equipment for business it is in an extraordinarily good position to fill all orders for cedar ties, poles, piling and posts, on the shortest notice and with the greatest promptness. William A. Dennis of the company has recently visited Chicago, and it is said that the final negotiations for the purchase of the cedar land described were consummated during his visit. Mr. Dennis has been most energetic in pushing the affairs of his company, and it is said to be largely through his personal efforts that the Kirby-Dennis company is in its present condition.

The Connecticut Telephone and Electric company of Meriden, Conn., spent two years in perfecting a central-station switching apparatus, which is receiving a great deal of favorable comment from the telephone trade. The company now offers a switchboard for which its claims are exceedingly strong, as the drops and jacks are combined and are self contained and interchangeable, and can be immediately removed from the board in a fraction of a minute. In this system the company uses no clearing-out drops in switch levers or calling keys cut into the great circuits, but the call is answered, the shutter reset, the person wanted called and the necessary connections made in only two visible moves. It is needless to say that these points appeal particularly to the manager of exchange work, as it means reduction in cost of operation, quicker service, less operators and larger dividends to stockholders. These switchboards are manufactured from four to 1,000 drops, and are now in daily operation in prominent localities in this country. In the manufacture of telephones the company has 25 different styles which amply meet all the requirements of the average purchaser, and a full line of telephone supplies, and everything that is necessary to the telephone business. From a small beginning the Connecticut Telephone and Electric company has now grown to large proportions, and is recognized as one of the strongest companies in the telephone field.

It is understood on good authority that the Chicago Telephone company has just executed a lease with George H. Holt, owner of the Manhattan building on Dearborn street, Chicago, for 20 years, taking over 4,000 feet on the seventh floor, it being the intention of the Chicago Telephone company to locate its "Harrison" exchange in that building in order to better cover the surrounding congested district. The Chicago Telephone company, it is said, will spend $180,000 to locate the Harrison exchange in the Manhattan building, and it is also stated that the telephone company decided on the Manhattan building after examining a number of others; it was owing to its being so well lighted and ventilated and its strength of construction that the Manhattan building was chosen. As is well known, the Manhattan is a 16-story building and has the general offices of 18 great insurance companies, as well as the offices of the Hoosac Tunnel fast freight line, Nickel Plate fast freight line, etc. It is in almost what might be called the center of the electrical section of Chicago, being close to the Monadnock block, Old Colony building and Ellsworth building. Three hundred and twenty-one feet of its ground floor, too, has just been rented to the Safety Insulated Wire and Cable company for a western store and offices, and it is said also that the Sprague Electric company is figuring on taking two main stores on the ground floor. The management proposes to make the Manhattan building what might be called a high-class "electrical building."

De Veau & Co. of 27 Rose street, New York, are prominently known in the electrical field as being among the pioneers in the manufacture of telephones. Being established in 1892, with Mr. A. S. De Veau as general manager, their success has been continued from the start. Mr. De Veau has been connected with the manufacture of telephones and magneto bells for over 12 years, having been originally identified with the Western Electric company, in its telephone department; he was also an operator and inspector in the American Telephone company. This firm has been obliged from the first to continually extend its facilities to meet the growth of the business, and on February first De Veau & Co. moved into their present quarters, which gave them an opportunity to give the production that their orders called for. Their superintendent, Mr. J. Auth, began in the early days to work in the electrical and telephone business, having been identified with many of the large companies, and he has had an experience that has been of great advantage to De Veau & Co. De Veau & Co. at present employ over 50 hands and have a large trade with all the principal electrical contractors of the United States, and supply telephones to the United States government and all of the principal railroads of the country. Their telephones and magneto bells are well known and familiar to all of the purchasing agents in the country, and they have supplied several large telephone exchanges with their product. One fact of which they are justly proud is that they have never had a lawsuit, nor has a question occurred in regard to their telephone apparatus infringing upon that of any other manufacturer. Employing skilled workmen and high-class labor, they are at all times able to turn out a superior class of goods. The motto which is followed in this establishment, and which greets the eye upon entering the office, is "Satisfaction guaranteed in every particular." And it is to this rule that De Veau & Co. ascribe much of their present success.

Hammacher, Schlemmer & Co. of 209 Bowery, New York, who furnish telephone-box hardware, are pioneers in the business. The firm was established in 1848, and has been in the front rank continually since. They carry a large stock of staple and fancy cabinet hardware, brass trimmings of all kinds, butts, locks, latches, screws and nails in all varieties, bolts, rivets, coach or lag screws, besides glue, sandpaper and supplies of all kinds. They also carry a large stock of builders' hardware and supplies, and can furnish all the hardware required for factory buildings. For factory supplies they are headquarters, as they carry complete stocks of belting, pulleys, trucks, and smaller supplies of every character for shipping-room use. Two other departments complete their list. One of tools for all trades and one of piano material and supplies. The latter bears peculiar interest in this connection due to the fact that they carry a large stock of imported music wire. This wire is particularly valuable for electrical purposes on account of its great tensile strength and absolute uniformity, two points rarely obtainable outside of imported music wire. This line also includes a large assortment of felt and cloths in various qualities. The department of tools for all trades is, as its name implies, literally one of tools for all trades. First, for the carpenter every conceivable kind of tool he requires, beginning with the hammer and the saw and going down through all the grades of fine joinery and inside work, supplying tools for each successive step. Next the cabinetmaker, the woodturner, the electrician, the machinist, the steamfitter, the plumber, in fact none are left out of the long list—tools for all trades in earnest. It is not necessary to add that for telephone-box hardware this house stands ready to submit samples and prices worthy of consideration. They can furnish everything needed, and are also well prepared to figure on special work of every character along hardware lines, and offer the lowest prices possible for first-class goods. They have been established at 209 Bowery for nearly half a century and their precedence to-day is the reward of merit.

ILLUSTRATED ELECTRICAL PATENT RECORD.

Issued February 15, 1898.

598,905. Apparatus for Electrically Measuring Temperatures. Hugh L. Callendar, Montreal, Canada. Application filed July 31, 1896. Patented in England December 21, 1891.

The apparatus combines a galvanometer and compensating field coils in the electrical circuit of a standard resistance. The wire of a pyrometer is adapted for use in connection with this circuit.

598,922. Automatic Cut-out for Electrical Converters. William J. Greene, Cedar Rapids, Iowa. Application filed January 13, 1896. Renewed May 21, 1897.

In a suitable supporting frame there are a pair of solenoids oppositely inclined to each other, means for alternately energizing the solenoids, a switch-arm adapted to close and break the primary and secondary circuits, with a curved armature attached to its free end and co-acting with the solenoids, a pair of solenoid switches and a connection between them adapted to throw one open when the other is closed, and a projection on the switch-arm adapted to engage the solenoid switches alternately when near the limit of its stroke.

598,926. Box or Case for Secondary Battery Electrodes. George W. Harris and Richard J. Holland, New York, N. Y. Application filed September 3, 1896. Renewed July 17, 1897.

The receptacle is formed of insulating material and provided interiorly on its opposite sides with ribs which are integral with the sides and between which ribs are grooves for the reception of the ends of the electrodes, so that the latter will be held separated from each other, the ribs running uninterruptedly to the height of the electrodes to be received between them, so that buckling of the electrodes will be prevented, and the grooves having a special lining of insulating material and terminating at their bottoms in shoulders.

598,937. Trolley. Charles H. Johnson, Elmhurst, Cal. Application filed October 24, 1896.

One claim describes the combination of an upright secured to the top of a car, a post fitted thereto so as to revolve, means for holding the post in one of two positions, a block pivoted to the top of the post, a trolley-arm having a slot therein embracing the block, springs arranged within the slot for maintaining a normal position of the pole, a spring for overbalancing the outer end of the pole and a trolley carried by the outer end.

598,942. Electric Arc Lamp. George R. Lean, Cleveland, Ohio. Application filed February 20, 1897.

Of 43 claims the first is given: The combination in an electric arc lamp constructed to operate with alternating electric currents of a starting coil, a feeding coil, the feeding coil included in series with the starting coil, an armature for each coil, said armature being normally so disposed relatively to the magnetic fields of the respective coils that the armature of the starting coil will be actuated in advance of the armature of the feeding coil, devices connecting said armatures and connections between one of said armatures and the carbons of the lamp.

598,943. Electric Arc Lamp. George R. Lean, Cleveland, Ohio. Application filed February 20, 1897.

In this lamp both carbons are fed simultaneously and the arc is inclosed. The inner globe is supported in such manner as to permit the globe to have sufficient play to compensate for irregularities of the carbons.

598,946. Direct-acting Oscillating Electric Motor. James H. Mason, Brooklyn, N. Y. Application filed March 24, 1897.

A direct-acting oscillating electric motor comprising field magnets having forwardly extended arms projecting at right angles to the axis of their coils, means for energizing the field magnets, an armature comprising a plurality of radially extending arms mounted to rock back and forth between the projecting arms of the field magnets, the arms being provided with coils, means for maintaining a constant current through the coils of the armature and means for changing the polarity of the field magnets.

598,947. Track Bond for Electric Railways. Frank T. Mather, Detroit, Mich. Application filed June 29, 1896. Renewed December 24, 1897.

A system of bonding having a continuous flexible conductor laid in a groove in the flange of the rail and extending the whole length of the track. At the rail-joints a loop depends through an opening in the flange formed by cutting through the groove at the ends of the rail sections.

598,948. Electric Battery for Medical Purposes. Carl W. Moessner, Philadelphia, Pa. Application filed June 2, 1896.

In a medical battery, the rheostat for controlling the electric currents composed of a series of alternately arranged metallic and composition members, the metallic members being each composed of a series of metallic strips and provided with contacts, and a movable switch adapted to be moved over the contacts.

598,972. Tip for Electric Conductors. Alden B. Blodgett, Lowell, Mass. Application filed December 22, 1896.

An electric conductor comprising a conducting core, a non-conducting covering and a conducting needle having a transverse hole arranged within the covering, a wire passed through the covering and hole and bent on the outside of the covering to retain the needle and wire in place and a shell surrounding the needle and the end of the covering.

598,991. Controller for Electric Motors. Ernst W. G. C. Hoffmann, Charlottenburg, Germany. Application filed December 29, 1897. Patented in Germany November [illegible], 1895; in Sweden April 14, 1896; in Switzerland April [illegible], 1896; in England April 17, 1896; in Norway April 18, 1896; in Belgium April [illegible], 1896; in France April 20, 1896; in [illegible] 1896; in Austria June 24, 1896, and in Denmark January [illegible], 1897.

The combination in a controller for electrical apparatus with a controller part having suitable contact parts connected therewith for effecting the necessary circuit changes, of a rheostat, a part controlling the resistance of the rheostat connected in circuit, and means for automatically cutting a predetermined amount of resistance into circuit when the movement of the part is effected.

599,002. Incandescent Lamp. John T. Lister, Cleveland, Ohio. Application filed October 14, 1896. Renewed January 17, 1898.

This is the language of the claim: In an incandescent lamp, the combination with the annularly recessed extremities of the shell, of a cylindrical-cap therefor adapted to fit interchangeably over either extremity, a pair of filament electrodes extending through each shell extremity, corresponding electrodes adapted to engage the pair of filament electrodes when the lamp is in place, and means for securing the cap upon the shell extremity consisting of a wire spring partially encircling the cap and provided with inwardly turned extremities which pass through the wall of the cap and enter the annular recess in the shell.

599,015. Electric Elevator. Harold Rowntree, Chicago, Ill. Application filed February 28, 1896.

The principal feature of this elevator is the use of an auxiliary motor as well as the main driving motor. By the joint action of the speed of the two motors means is obtained for controlling the main motor.

NO. 599,002.

599,019. Automatic Railway Gate. John F. Small, Chicago, Ill. Application filed January 12, 1895.

A railway gate comprising a gate-arm normally held in an upright position, a solenoid interposed in a normally open circuit, a core, a connection between the core and gate-arm, whereby as the circuit is closed and the solenoid energized the core will be attracted to lower the gate-arm, an electro-magnet interposed in an independent normally open circuit and provided with an armature normally adapted to engage the connection between the solenoid core and gate-arm and hold the latter in a lowered position until the magnet is excited and the armature attracted, when the parts will be released.

599,032. Electric Arc Lamp. Charles N. Black, New Haven, Conn. Application filed April 20, 1897.

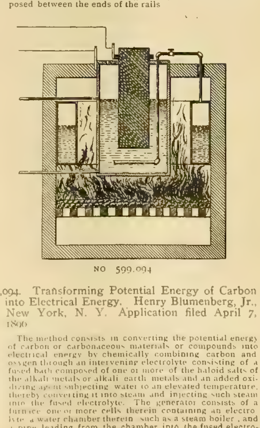
An armature is actuated by an electro-magnetic mechanism, and is pivoted to one side thereof; the free end of the armature carries the plunger of a dash-pot; the dash-pot is loosely supported from above in the line of movement of the plunger.

599,046. Electric Meter. Carl Raab, Kaiserslautern, Germany. Application filed February 27, 1896. Patented in England January 13, 1896, and in Germany May 30, 1896.

An electric meter having a disk armature and two coreless solenoids placed on opposite sides of the disk and in inductive proximity thereto, in combination with two electro magnets located also on opposite sides of the disk and having pole-pieces extending into close proximity thereto, the solenoids being located in the circuit to be measured and the electro-magnets in a shunt circuit thereto.

599,081. Insulated Joint for Railroad Rails. Thomas O'Brien, Jr., Philadelphia, Pa. Application filed June 4, 1897.

Features of this device are a cross-tie of non-conducting material, a metallic plate seated on the cross-tie having a recess formed in its upper face near an end thereof, an insulating block seated in the recess and substantially surrounded by the walls thereof and held thereby against accidental displacement, a rail having an end resting on the non-recessed end of the metallic plate, a rail having an end resting on the insulating block, and insulation interposed between the ends of the rails.



NO. 599,094.

599,094. Transforming Potential Energy of Carbon into Electrical Energy. Henry Blumenberg, Jr., New York, N. Y. Application filed April 7, 1896.

The method consists in converting the potential energy of carbon or carbonaceous materials or compounds into electrical energy by chemically combining carbon and oxygen through an intervening electrolyte consisting of a fused bath composed of one or more of the haloid salts of the alkali metals or alkali earth metals and an added oxidizing agent subjecting water to an elevated temperature, thereby converting it into steam and injecting such steam into the fused electrolyte. The generator consists of a furnace, one or more cells therein containing an electrolyte, a water chamber therein, such as a steam boiler, and a pipe leading from the chamber into the fused electrolyte.

599,121. Electric Gas-lighting Apparatus. William E. Cram and James H. L. Clegg, Boston, Mass. Application filed April 30, 1897.

A switch is operated by the movement of the gas-cock for making and breaking an electric circuit; an electro-magnet is arranged in this circuit and having a vibratile armature provided with a contact member arranged in proximity to the orifice of the gas-burner; a thermostat is arranged in the circuit and adapted to co-act with the vibratile member in causing a series of gas-igniting sparks, and to be expanded by the heat of the gas-flame, so as to separate the sparking points to break the electric circuit at the point of sparking, and to keep them separated during the existence of a flame.

599,162. Electric System of Propulsion. William M. Brown, Johnstown, Pa. Application filed May 18, 1897.

The combination, in an electric railway, of main feeders in sections, detachable connections between adjacent ends of the feeder-sections, groups of disconnected contacts corresponding in number to that of the feeder-sections, and sub-feeders connecting the individual members of each group with the connected ends of one pair of the feeder-sections.

599,186. Electric Controller. Frank A. Merrick, Auburndale, Mass. Application filed May 27, 1897.

A rotatable contact-carrying drum and a series of fixed fingers engaging therewith, in combination with an energizing coil for a magnetic arc-interrupter, connections from one side of the circuit through the energizing coil to one of the fixed fingers, this finger contacting with the drum at all of its operative positions, a direct connection from the same side of the main circuit to another of the fixed fingers, the last-mentioned finger contacting with the drum at only a part of its operative positions.

599,220. Electric Alarm Water Column. Martin L. Bush, Lawrence, Mass. Application filed June 14, 1897.

An alarm is electrically sounded when a float in a boiler water-gauge reaches a predetermined position.

599,274. Trolley Pole for Overhead Electric Railways. Joseph L. Walker, Louisville, Ky. Application filed June 18, 1897.

A three-jointed pole having its members pivoted together and provided with a trolley-wheel at its outer member, combined with a latch which holds two of the members in alignment, and trip devices operatively connected to the wheel-carrying pole member and the latch, whereby the latch is released when the trolley-wheel slips off the conductor and the pole is permitted to collapse.

599,292. Underground Conduit for Electric Wires. Adelbert L. Daniels, North East, Pa. Application filed December 22, 1897.

The conduit consists of sections having a metal case, with ends of insulating material of less internal diameter than the case, the ends of adjacent sections conformed to fit together, and a lining of insulating material connecting the ends.

599,302. Direct-current Meter. Gustave A. Scheeffer, Peoria, Ill. Application filed May 7, 1896. Patented in Canada December 2, 1896.

The first claim reads: In an electric meter, the combination with field coils connected with the circuit to be measured, of an armature adapted to be actuated thereby which is connected with said circuit and with the field coils to receive current passing through said coils sufficient to supply a torque thereto adapted to overcome the initial friction of the rotating parts.

599,304. Demagnetizing Device. Harry A. Storrs, Burlington, Vt. Application filed June 18, 1897.

The essential electro magnet has overhanging poles, and is adapted to produce an alternating magnetic field; a rotatable carrier for the object to be demagnetized having a fixed axis and adopted to move the object slowly between the poles of the magnet is provided, and a shield is interposed between the lower pole of the magnet and the object to prevent contact of the latter with the pole.

599,305. Electric Arc Lamp. Christian Tepel, Bennett, Pa. Application filed March 10, 1897.

The mechanism includes a pulley, suitable connections between the same and the carbon-holders for producing opposite movements of the latter by the turning of the pulley, a clutch-wheel fast with the pulley, a lever pivoted concentric with the clutch-wheel, a dog pivoted to one end of the lever and arranged to engage the periphery of the clutch-wheel, an abutment for the dog to encounter under one direction of movement of the lever to free the dog from its wheel, an air-cushion on the same arm of the lever, an electro-magnet in the lamp-circuit and a core in the magnet connected with the opposite side of the lever.

599,306. Making Filaments for Electric Lighting. Detlef C. Voss, Boston, Mass. Application filed August 3, 1891.

A filament for electric lighting built up and composed from aluminum and iodine; also the process of building up a filament by exposing the same in a vessel or flask containing the vapor of the alcoholic solution of iodide of aluminum while an electric current is passed through the filament.

599,307. Trolley-actuated Switch-operating Device for Electric Railways. Louis E. Walkins, Springfield, Mass. Application filed August 18, 1897.

In a "third-rail" electric railway system, the combination with the third-rail sections and the dividing length of insulating material having the recess of an electric switch, a depression member located in the recess and having its upper edge normally above the top of the tread-surface of the insulating material and provided with a supporting spring, and in moving serving to operate the switch, and provided with a depending ratcheted member, an electro-magnet having an armature normally in position for engagement with the ratcheted member, and adapted when the magnet is vitalized to withdraw the armature from its position of engagement.

Western Electrician.

EVERY SATURDAY.

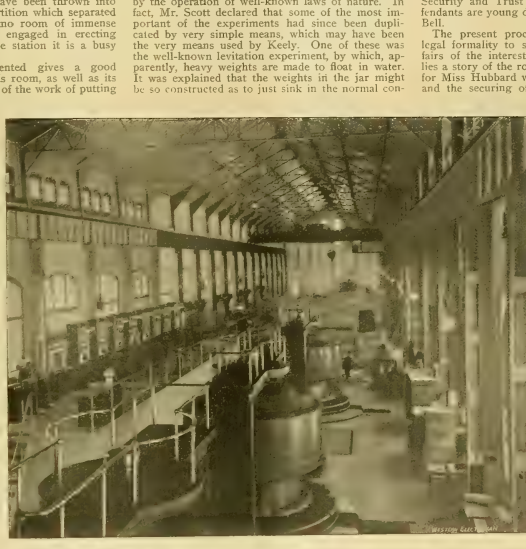
Vol. XXII. CHICAGO, MARCH 5, 1898. No. 10

Enlarged Power House at Niagara Falls.

During the several conventions of electrical men at Niagara Falls last summer much interest was shown in the work of extending the power plant of the Niagara Falls Power company. At that time the new building was in course of construction and the wheel-pit was being extended. The old building was, of course, separated from the new part by a wall, and the delegates and visitors who inspected the work were compelled to rely upon their imaginations for a picture of the dynamo room when the new part would be completed and the partition removed.

The work has now reached a point where the entire building is enclosed, and the new and old portions of the dynamo room have been thrown into one by the removal of the partition which separated them. This makes the dynamo room of immense size, and as many men are engaged in erecting the additional dynamos in the station it is a busy place.

The picture herewith presented gives a good idea of the present size of this room, as well as its condition during the progress of the work of putting in the new machines, and will certainly prove of interest to all who have visited and inspected the original plant. The floor is, of course, littered with boxes and packages containing the various parts, while far in the distance may be seen the 50-ton electric traveling crane used to place the heavy parts of the installation in place. By the girder to the left may be gained a good idea of the length of the new and old sections, the dark part representing the new, and the light the old. Generator No. 4 and its connected turbine will soon be ready for operation. Other generators have arrived at the Falls from Pittsburg and will be placed in position without delay. When the 10 great 5,000 horse power generators are in line the sight in the power house will be most imposing. Down in the pit the bulkheads between the old and new parts have been taken out and the two sections have been thrown into one. Men are now busy installing the turbines, adding much to the activity about the station.



ENLARGED POWER HOUSE AT NIAGARA FALLS—VIEW OF DYNAMO ROOM, 426 FEET LONG.

As extended the power house provides for 10 generators, while the extended wheel-pit has room for the same number of turbines. There are now three generators and turbines in place, and, as already mentioned, the fourth will soon be ready for service. It is the intention of the company to have five of the seven additional turbines and generators installed by the Westinghouse Electric and Manufacturing company is supplying the generators, and the I. P. Morris company of Philadelphia the turbines. These concerns made the turbines and generators of the original installation now in use. The new turbines and generators will be of the same capacity as those installed. The new section of the pit is bricked to a height of about 40 feet with a 30-inch wall, 1,800,000 brick being used. The length of the original section of the power house is 150 feet, while that of the addition is 286 feet, making a total length of 426 feet. This, it will be readily understood, comprises the largest dynamo room in the world.

The details of construction of the wheel-pit have already been given in this journal, and the plans for the extension of the power house, including several changes in arrangement, construction of apparatus and operation, have been fully explained.

It is said that a company will be chartered, with a capital stock of $5,000, to construct and operate a telephone line between Princeton and Athens, W. Va. R. G. Meador, F. Holroyd and W. J. Lilly of Athens and William M. Maxwood of Princeton are mentioned as incorporators.

The Peculiar Mr. Keely and His Motor.

Eben A. Scott read a paper on the Keely motor before the Engineers' Club of Philadelphia not long ago. He described four visits which he had paid to the laboratory of Mr. Keely to inspect the apparatus in the interest of one of the largest stockholders in the motor company. In substance, it was stated that both he and Addison B. Burk, president of the Spring Garden Institute, who accompanied him on some of his visits, had reached the conclusion that Keely had discovered no new force, and had shown no apparatus which demonstrated or could demonstrate such a force, but that many of the things done by Keely could be readily performed by the operation of well-known laws of nature. In fact, Mr. Scott declared that some of the most important of the experiments had since been duplicated by very simple means, which may have been the very means used by Keely. One of these was the well-known levitation experiment, by which, apparently, heavy weights are made to float in water. It was explained that the weights in the jar might be so constructed as to just sink in the normal condition of the jar, and to rise when a slight increase of air pressure was put upon the surface through a fine tube carrying compressed air. Over the principle of the "Cartesian diver." This tube, called a platinum wire by Keely, was said to form an essential part of most of his apparatus.

The reading of the paper was followed by a discussion in which Mr. Collier, who said he had been connected with the company for 23 years, denied that the wire was a tube, and claimed that Keely would yet be shown to be the greatest discoverer of the age. He stated that some years ago Prof. Rowland of Johns Hopkins University had also said it was a tube, and asked Keely to cut it, but that Keely refused, as he was a peculiar man, and would not turn his hand over to prove a point to an inquirer, although besought to do so by his friends. He offered to give a lecture to the club on Keely's inventions, and when asked by a member whether he would bring Keely with him with the jar in question and make the demonstration before the club, he said that Keely had repeatedly refused to do anything of the kind. Mr. Collier was asked whether he knew the real facts in regard to Keely's discovery, and whether in case of Keely's death, he could carry on Keely's work. And if so, whether he would then come before the engineers and explain its merits fully. To this Mr. Collier replied that he knew all that Keely had chosen to, and that in the event of Keely's death he would be willing to give the desired explanation.

Prof. Bell's Romance.

An interesting story comes from Washington as an outcome of the suit instituted on February 25th by Prof. Alexander Graham Bell and his wife, Mrs. Mabel G. Bell, against Mrs. Gertrude M. Hubbard. Charles J. Bell, Elsie May Bell and Marion Hubbard Bell for the recovery of $59,798 and the appointment of the American Security and Trust company as trustee for Mrs. Bell to secure her interest in a trust fund, held for her by her father, the late Gardiner G. Hubbard. All the parties to the suit are related. Prof. Bell is the inventor of the telephone. Mrs. G. M. Hubbard is his mother-in-law and C. J. Bell is his brother-in-law and president of the American Security and Trust company. The other two defendants are young daughters of Mr. and Mrs. A. G. Bell.

The present proceedings appear to be a mere legal formality to secure an adjustment of the affairs of the interested parties, but behind the suit lies a story of the romantic attachment of Prof. Bell for Miss Hubbard which resulted in their marriage and the securing of the financial aid from Prof. Hubbard for the then newly invented telephone. Many years ago Mr. Bell was engaged at Washington as a teacher of the deaf and dumb, employing his leisure time in experiments with the idea of transmitting the human voice over a wire. During this period Mr. Bell became acquainted with Miss Hubbard, who was one of his pupils, and the two were thus thrown into contact frequently. They fell in love, and Mr. Bell proposed marriage.

In order to protect the interests of Miss Hubbard, who, as daughter of a rich man, had considerably better prospects than the young professor, a contract was entered into by Mr. Hubbard and Mr. Bell. The terms of this contract, as set forth in the bill filed last week, provided for the creation of a trust. Mr. Bell conveyed all his interests in his patents on the telephone, both at home and abroad, to Mr. Hubbard, to hold in trust for Mrs. Bell. Mr. Hubbard was to pay the income from these patents to Mrs. Bell as long as the income did not exceed $3,000 a year. When the revenue exceeded this figure it was provided that the excess should remain in Mr. Hubbard's hands until it reached the amount of $200,000. After this it was to be held as a trust fund, and all the income from the patents and the interest on the $200,000 was to be paid to Mrs. Bell. The trust was to continue until the death of Mrs. Bell, and the fund was then to go to her children, or, if she had none, to Mr. Bell.

This contract was executed on July 9, 1877, and Mr. Bell and Miss Hubbard were married. The bill recites that Mr. Hubbard faithfully performed his part of the contract until his death in the latter part of 1897. He left a will in which he devised his entire estate to Mrs. Hubbard, his widow, without any qualifications, and in fee simple. Mrs. Hubbard and Mr. C. J. Bell were named as executors without bond. It was discovered after Mr. Hubbard's death that the trust fund amounted to $259,798, and a list of the real estate and stocks held by Mr. Hubbard for the trust is filed. Mrs. A. G. Bell, therefore, under the terms of the trust, believes herself to be entitled to $59,798 at once, and asks that the American Security and Trust company be substituted for the executors of the will of Mr. Hubbard, so far as concerns the trust. The value of the estate left by Mr. Hubbard is given at $475,000 in stocks and real estate, $50,000 in furniture, and $59,000 due on notes.

W. R. Proctor, Breck B. Smith and Charles R. Powell have incorporated a company to construct a telephone system at Versailles, Ky.

Proposed Trolley Extensions on the Chicago City Railway System.

Ordinances have been introduced in the Chicago City Council providing for the extension of the present trolley system of the Chicago City Railway company as follows:

Indiana avenue, from Fifty-first to Sixty-third street.

Indiana avenue, from Eighteenth street to Twelfth street.

Fifty-sixth street, from State street to South Park avenue.

Fifty-sixth street, from Stony Island avenue to Lake avenue.

Twelfth street, from Indiana avenue to State street.

Vincennes avenue, from Thirty-fifth street to Forty-third street.

St. Lawrence avenue, from Forty-third street to Fifty-first street.

Lake avenue, from Forty-seventh street to Fifty-seventh street.

Fifty-first street, from west line of South Park avenue in Fifty-first street, east thereof to Cottage Grove avenue.

Fifty-second street, from Cottage Grove avenue to Lake avenue.

Center avenue, from Sixty-third street to Sixty-ninth street.

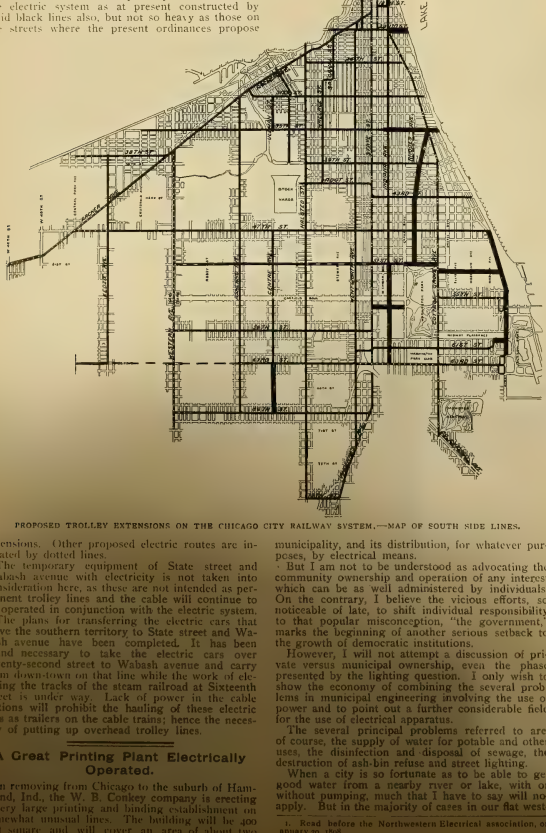
Stony Island avenue, from Fifty-sixth street to Sixty-second street.

Sixtieth street, from South Park court to Stony Island avenue.

Sixty-ninth street, from Vincennes avenue to Anthony avenue.

Keefe avenue, from Anthony to Chicago avenue.

In the accompanying map the proposed trolley extensions are indicated by heavy black lines, and the electric system as at present constructed by solid black lines also, but not so heavy as those on the streets where the present ordinances propose extensions. Other proposed electric routes are indicated by dotted lines.



PROPOSED TROLLEY EXTENSIONS ON THE CHICAGO CITY RAILWAY SYSTEM.—MAP OF SOUTH SIDE LINES.

The temporary equipment of State street and Wabash avenue with electricity is not taken into consideration here, as these are not intended as permanent trolley lines and the cable will continue to be operated in conjunction with the electric system.

The plans for transferring the electric cars that serve the southern territory to State street and Wabash avenue have been completed. It has been found necessary to take the electric cars over Twenty-second street to Wabash avenue and carry them down-town on that line while the work of elevating the tracks of the steam railroad at Sixteenth street is under way. Lack of power in the cable stations will prohibit the hauling of these electric cars as trailers on the cable trains; hence the necessity of putting up overhead trolley lines.

A Great Printing Plant Electrically Operated.

In removing from Chicago to the suburb of Hammond, Ind., the W. B. Conkey company is erecting a very large printing and binding establishment on somewhat unusual lines. The building will be 400 feet square and will cover an area of about two acres. It will be only one story high, and with especially arranged skylights the whole interior of the large building will be literally "as light as day." All the machinery in the plant will be electrically driven, and some 55 motors will be required, ranging from 10 horse power downward. About 42 of the large printing presses will be direct-connected to motors, and the smaller machines will be arranged in groups, with one motor for each. The power and heating plant will be housed in a separate building. It will include one 150 horse power, 220-volt, direct-current generator at the start, although it is planned that another unit of the same size shall ultimately be added. The lights and motors will be wired on the same circuits, and 220-volt lamps will be used. B. J. Arnold is the electrical engineer.

Electricity in Municipal Engineering.[1]

By Prof. R. B. Owens.

My object in presenting this paper is to emphasize the economy which can often be effected by generating at one point all the power required by a municipality, and its distribution, for whatever purposes, by electrical means.

But I am not to be understood as advocating the community ownership and operation of any interest which can be as well administered by individuals. On the contrary, I believe the vicious efforts, so noticeable of late, to shift individual responsibility to that popular misconception, "the government," marks the beginning of another serious setback to the growth of democratic institutions.

However, I will not attempt a discussion of private versus municipal ownership, even the phase presented by the lighting question. I only wish to show the economy of combining the several problems in municipal engineering involving the use of power and to point out a further considerable field for the use of electrical apparatus.

The several principal problems referred to are, of course, the supply of water for potable and other uses, the disinfection and disposal of sewage, the destruction of ash-bin refuse and street lighting.

When a city is so fortunate as to be able to get good water from a nearby river or lake, with or without pumping, much that I have to say will not apply. But in the majority of cases in our flat western country water is only obtainable from wells, driven or dug, and when a considerable amount is required, as for city use, it is generally necessary to separate the wells as far as practicable, because of the limit to the supply which can be continuously obtained per unit of volume of water-bearing strata.

In small towns of a few thousand inhabitants, where the underflow is good, it is usual to find driven wells 10 to 20 feet apart and a direct-acting steam pump over each, an arrangement which, as a rule, requires the construction of a railway siding for rapid coal supply. In cases of this kind I have recommended power pumps driven through a countershaft by an engine of economical design. To the same countershaft one or more dynamos can of course be attached. Now if both dynamos and pumps are driven by clutch pulleys, it is possible by shutting down pumps as dynamos are started, and varying the number in operation as lighting load varies, to keep an almost exactly constant load on the engine—the most favorable condition for its economical operation.

In larger towns, of from fifty to sixty thousand inhabitants and upwards, it is not unusual to find half a dozen pumping stations from one-half to one mile apart, each with a full complement of boilers, steam pumps and attendants, and the whole operated apparently as much in the interest of the coal dealers and those on the pay-roll as for the taxpayers. A one or two-cylinder pump without flywheel, lifting from a single dug well and discharging directly into the mains, is usual.

In a case of this kind recently coming to my notice, I urged the immediate substitution for the steam pumps of an equal number of triplex power pumps operated by constant-torque, variable-speed motors, the current for such motors to come from a central power plant equipped with economical chinery and suitably located.

The annual saving as the result of such a change was estimated to be more than 50 per cent. of total cost of operation. It might be remarked here that the recent appearance of satisfactory constant-torque motors, in both alternating-current and direct-current types for operation from constant potential circuits, removes the last difficulty in the most general application of electric power, and now it can be confidently hoped that non-expansive steam working, as in boiler-feed pumps, drain pumps, etc., in our lighting and power plants and also in many cases of pumping from wells against a constant head for city and other supply, will soon become a thing of the past.

The demand for water not being constant during the day, a suitable reservoir should always be supplied of such a capacity as not only to allow the engine or engines to operate at constant load, but also to supply the extra water for fire purposes whenever it is required. Such a reservoir, though indicated by economy, is often lacking, in whole or in part, and more unfortunate still is the too small size of mains usually employed, the latter necessitating in some cases that the pressure at the pumping stations be more than doubled during a fire to obtain normal or approximately normal pressure at points where fire engines are attached.

These faults, however, the absence of suitable storage capacity and too small pipe, belong to the original design, and have nothing to do with the kind of power used for the pumps. But their absence will, of course, be seen to greatly facilitate the economical operation of a combined plant—one intended for the utilization of ash-bin refuse, the supply of power for pumping, for disinfecting of sewage and for street lighting.

The usual method of handling sewage is by means of a water-carriage system—draining into the nearest stream without disinfecting. But this practice is barbarous. No system of sewage is complete which does not abstract the solid matter and sterilize the liquid portion before turning it into our waterways.

The solid matter is readily precipitated as "sludge" in settling pools, and the clear effluent subsequently treated or not, as the case may be. The sludge can be dried and pressed to about one part by weight of water and one part by weight of solids. This pressed sludge amounts to from one to two hundred weight per annum per head of population, according to recent statistics. At first it was thought to have a high fertilizing value, but I believe it is generally recognized now as being useless for such purpose.

It has, however, more than sufficient calorific value to evaporate the water it contains and to destroy itself, and so may profitably be mixed with ash-bin refuse and used for fuel.

Chemical methods of sewage disinfection, when effective, are expensive, and it would seem that electrical methods must supersede them in the future. The two principal methods of manufacturing a disinfecting fluid by electricity are Hermite's and Woolf's, the former being used principally on the Continent and the latter in this country. They do not differ much except in detail. In both systems the disinfectant is obtained by passing a large current of electricity at low pressure through sea or salt water, prior to or after being mixed with the sewage. From this results the formation of certain hypochlorites, hypobromites and iodine compounds—the latter are for the most part in the form of iodates—all strong oxidizing agents, directly or indirectly.

Where a common drainage and sewage system is adopted, the disinfecting liquid may be greatly di-

1. Read before the Northwestern Electrical association, on January 20, 1898.

luted during a storm, but the trouble is obviated by the adoption of separate systems, or by the use of a reservoir holding a considerable quantity of the liquid to be discharged into the sewage system in times of heavy rains.

One installation of the Woolf system reported consists of a 15 horse power engine with suitable dynamo, tanks, etc. A bacteriological examination made by competent persons showed almost perfect sterilization. This plant is considered sufficient for disinfecting the sewage of 30,000 population, if run continuously. At usual rates for fuel and attendance, the cost per inhabitant per annum was shown to be about 25 cents. A similar cost per inhabitant has been obtained elsewhere.

It will be seen, however, that this figure can be reduced to a small fraction of itself if the system were operated as a part of a combined plant instead of as a small separate one. As compared with other systems of sewage purification, chemical, land filtration, or a combination of chemical and land systems, the cost per inhabitant per year by the electrical system, even when current is supplied from a special plant, is apparently less by from one-half to two-thirds.

Another important point to note in this connection is that the electrical system, while cheaper and in general more effective, requires power at practically a uniform rate, a condition fitting in very perfectly with the economic operation of a pumping plant and the requirements of a plant to burn and utilize town refuse.

The matter of disposal of ash-bin or more generally town refuse has not received the attention it deserves. There is but one successful method of handling it, and that is to burn it; but town refuse has a calorific value equal to about one-fifth that of ordinary coal, and consequently may become, with proper arrangements for its burning, a source of profit instead of an expense.

A difficulty in utilizing the heat energy of town refuse for street lighting is that it requires to be burned at a very regular rate the twenty-four hours. To meet this, the so-called thermal system of energy storage has been devised; but since the power required for pumping, supposing some reservoir capacity in the water system, and for the electrical purification of sewage, is in many cases practically constant and more than that obtainable from the refuse, a combination plant would save the expense of such a thermal system and accomplish as much.

It has also been proposed to use such a thermal-storage scheme in connection with lighting plants having a poor load factor, but it may be seen that the following scheme is equally effective and involves very small extra cost. Instead of using separate thermal-storage tanks, by carefully lagging the entire boiler

FIG. 1. MICROPHONOGRAPH TO AID IN EDUCATING DEAF MUTES.

setting and providing removable insulating covers for the fire and ash pit doors, the boilers themselves may be converted into heat reservoirs. When one boiler of a battery is to be put out of service, the fire is allowed to burn as low as possible and the boiler well filled with water, then the fire and ash-pit doors are closed and covered, and the main steam valve to header shut tightly, as well as the damper in smoke flue. Any further steam generated by the remaining fire on the grate and by heat of setting finds its way into the header through a by-pass about the main steam valve. In this by-pass is placed a difference of pressure valve to operate whenever the boiler pressure exceeds the pressure in the header by a certain desired amount. The rate of loss of pressure or heat by such an arrangement can be reduced to an extremely small quantity. Now when the boiler is to be put in operation again it has a pressure equal to or perhaps greater than those in service and brings to their immediate aid its volume of stored energy on a sudden demand for steam. By providing arrangements for starting fires with oil when necessary, the stand-by boilers in a battery can be put into full operation at the rate of perhaps one a minute, or, in any case, quickly enough to meet such sudden demands for steam as occur in practice. I have recommended such a method of handling boilers in small city pumping plants, where, during the time steam is not required for pumping for ordinary purposes, the fires are banked for quickly getting up steam in the event of a fire. This scheme would

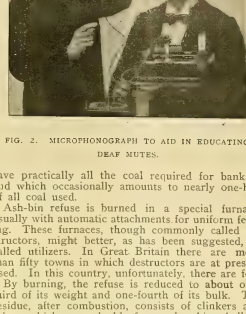


FIG. 2. MICROPHONOGRAPH TO AID IN EDUCATING DEAF MUTES.

save practically all the coal required for banking and which occasionally amounts to nearly one-half of all coal used.

Ash-bin refuse is burned in a special furnace, usually with automatic attachments for uniform feeding. These furnaces, though commonly called destructors, might better, as has been suggested, be called utilizers. In Great Britain there are more than fifty towns in which destructors are at present used. In this country, unfortunately, there are few.

By burning, the refuse is reduced to about one-third of its weight and one-fourth of its bulk. The residue, after combustion, consists of clinkers and ashes, which are valuable for road-making ballast. In the earlier forms of destructors the temperature was not high, but in more recent ones, designed to be odorless, the temperature of the gases is 1,500 to 2,000 degrees F., and the addition of a suitable boiler to absorb their heat is not difficult. Ordinarily, ash-bin refuse will amount to from one to four tons per inhabitant per year. Of course such refuse is a poor fuel, and as it burns with difficulty would seldom be used for steam making. However, it should be burned for sanitary reasons alone, and any profit from the utilization of the heat resulting is clear gain.

It is seen, then, that a destructor plant will combine very perfectly with a plant to supply current for sewage disinfection and for pumping.

For street lighting electricity need only be considered, as the demand for electric illumination, as against other means, is almost universal. But the peculiarity of municipal lighting as compared with ordinary commercial lighting is the constant power required while lights are in use—a feature which again lends itself happily to combination with a pumping plant and plant for sewage disinfection. Also in many cases it will be found that the amount of power required for lighting is not far different from the amount required for pumping. Now from what has been said, it will be evident that in many cases a combined plant can be designed to burn and utilize the ash-bin refuse, do the pumping of water from a series of scattered wells and supply current for street lighting and sewage disinfection, in which all the machinery will be loaded very nearly to full capacity 24 hours a day.

The extremely uneconomical machinery used for pumping in many places to-day, and the demand for better sanitation, offers, it seems to me, a very considerable further field for electrical machinery, and one which I trust will not long remain uncultivated.

The pressure of many recent demands must be my apology for this scant treatment of an interesting subject.

Microphonograph to Aid in Educating Deaf Mutes.

The microphonograph is a combination of the microphone and the phonograph and is the invention of Prof. M. F. Dussand, who occupies the chair of physics in the School of Mechanics at Geneva, Switzerland. This instrument forms the basis of what is termed a system of education of deaf mutes, but which in reality is a method of treating the weak auditory organs scientifically and developing them so that they will perform their natural functions.

To the original apparatus the telephone and the cinematograph have been added by the editor of the Revue Generale des Sciences and the manager of the Paris Telephone Company, who have been engaged in the development of the system. With this combination they are enabled to give to the unfortunates alluded to animated scenes with all the accompaniments of speech, music, laughter and other sounds which nature has heretofore denied them.

The condition of a large number of deaf mutes is explained by the fact that ordinary sounds make no impression on the auditory nerve. This sensitive organ is not infrequently inactive for want of excitation, and, to quote an authority, "movement creates the organ." The usual method of instructing the deaf to speak is the method of visual imitation—that is, the teacher calls the pupil's attention to the movement of his lips, and the pupil imitates as nearly as possible. This method is, of course, very far from satisfactory, although, being the best hitherto known, is constantly practiced in all schools for deaf mutes. But in the system recently inaugurated the sound is repeated as many times as necessary, and the visual example may accompany it. It has also the faculty of teaching modulation of tone, of accent, of musical intonation, all of which are impossible with labial instruction.

M. Gellé relates an incident where an infant of three and a half years, after the fourth lesson, commenced to hear, and distinguished between sound and silence. The word "papa," at first pronounced in a coarse, loud voice, became soft and agreeable after a training of the auditory nerve, through the medium of this instrument.

M. Gellé concludes his remarks on the uses of the microphonograph thus:

"Acoustic exercises through microphonic action render the education of the deaf mute possible from earliest infancy.

"The excitation of the auditory nerve and the nervous cavities of the ear is manifestly superior to all other educational processes, because it follows the natural route of development of the faculty of language, leads directly to the wakening of audition, and provokes the utterance of vocal language."

Experiments have been conducted between Paris and Lille with most satisfactory results. The circuit, a metallic one, led from the telephone transmitter, actuated by the phonograph, to the receiver at the other extreme of the line. So delicate was the apparatus that the sound of the movement of insects was readily transmitted and was audible 250 kilometers away.

It is proposed to exhibit a combination of these instruments in a hall fitted for the purpose, at the coming exposition in Paris, where a vessel will be represented weighing anchor previous to departure, while the song of the sailors, the farewells of the passengers, the sniffling of the sorry and the laughter of the happy will be broken in upon by the shrill whistle announcing "time to go," and the scene will all be enacted as well as the sounds. The vessel will afterward be shown warping away from port, when the orders of the officer, the grinding of the hoisting cable and the "round we go—we're off to-day" song of the tars will mingle with the creaking of the timbers and the labored breathing of the engine.

Coming back to the subject of deaf mutes' education, two illustrations reproduced from photographs are shown herewith, which plainly indicate the impression made by the apparatus. One of the subjects (Fig. 1), 40 years old, had never before heard a vocal or musical sound. The other (Fig. 2), a lad, is listening for the first time to the Marseillaise and beating time to the march with his hand.

The Electrical Shop.

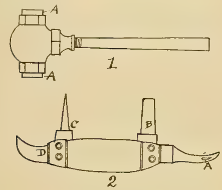
An esteemed contributor sends the following shop hints, which may be of value to the readers of the Western Electrician:

SOFT HAMMER

A good soft hammer for use about the electrical shop can be made without much expense by taking a three-quarter brass globe valve, taking off the hammer head and filling up the globe valve with hard babbitt metal, as shown in Fig. 1. The soft metal portion is marked A. The handle may be either wood or iron pipe.

COVERING EMERY CYLINDERS.

I always size my emery once or twice before using, but I don't wait until it is perfectly dry. When the emery is pretty well set, I reduce glue about two-



FIGS. 1 AND 2. THE ELECTRICAL SHOP.

thirds and go over lightly with a brush or sponge. When dry, I repeat the operation. It does not injure the cutting properties of the emery. After a short use the point of emery will be free of glue. Another way is to give the cylinder a good coat of glue as hot as it can be had. Put the emery into a funnel, holding it about two feet above the roll. Let it run through the funnel onto the roll, and keep turning the roll till it is cold. I do not put any size over the emery, and have no trouble with emery falling off.

A CONVENIENT SHOP KNIFE.

In Fig. 2 is a common four-bladed knife altered to suit the requirements of a belt-lacing tool and general electrical-shop knife. The blade D is to pull out old lace, C to open new holes, B for a screwdriver, and A for drawing wire. The latter blade should be softened and a hole cut for the eye, as shown, and the blade retempered. The blades can be ground to the shapes shown on a grindstone or emery wheel. The hook, awl and other blades all close into the handle, which makes it convenient for carrying in the pocket.

CEMENT ACID TROUGH.

In making a cement tank or vat in which to store liquid mixtures, the first thing to do will be to put in a foundation. To do this, excavate a section of the shop floor, in cellar or basement, about 2½ feet deep and of ample proportions for the size of the vat wanted. This hole should be filled with concrete made of broken stone, cement and sand. The cement and sand should be well mixed before it is wet, about half and half. The large part of this concrete should be stone, using just enough cement mortar to bed the stone. Mix the mortar very soft or wet, then put in the stone and mix all well together. Fill in about six inches of this concrete at a time and ram down solid. Make a box without any bottom out of one-inch board, the size you want the trough, outside measurement. Set this box on top of foundation. Now mix enough cement and sand, equal parts of each, to cover the bottom about half an inch to an inch thick, and spread this evenly over the bottom. Make another box the same as the first, but enough smaller so that when it is set inside of the first box there will be a space of about three or four inches clear around between the two boxes. Fill this space with mortar made of cement and sand in equal parts, using only enough water to make a very stiff mortar. Leave the wooden boxes in place until the cement is well set. The inside box can be removed by cutting a little off the end of two of the boards with a chisel. The cement used, especially what is above ground, should be the best Portland, and the sand clean and sharp. An outlet can be made by taking two pieces of 1½-inch gas-pipe and an elbow, and, when putting in the bottom, bed the pipe in so that the top of elbow will be level with bottom of the tank; the upright piece of pipe can have holes drilled through it at the height you want the contents to stand. A section through the tank is shown in Fig. 3.

MENDING A BROKEN TUBE.

Steel tubing is used in some descriptions of electrical apparatus, and if a tube is fractured, the part can be joined as in Fig. 4, C marking the point of fracture in the tube. To lead the union, plug one end of the tube with putty, run the metal into the other to right [illegible] allow it to harden; then put in a few riv[illegible] the job [illegible] done.

SCREWDRIVER AND HOLDER.

It is often necessary for the electrical machinist to put screws into places where it is impossible to start them with the fingers, and much time is lost fumbling with the screw before it is finally placed. Fig. 5 is a form of screwdriver provided with a divided blade, in the center of which is a push-piece, the latter being of thin steel and arranged to extend through the handle, and provided with a top A. A spiral spring B keeps the push-piece up, when the tool may be used as an ordinary screwdriver. If it is desired to place a screw in a difficult locality, the points of the blade are entered into the screw slot and the push-piece pressed down until the points open, pressing the sides of the slot, and so carrying the screw. The tool is easily made. It is shown in section in Fig. 6.

SOME QUALIFICATIONS.

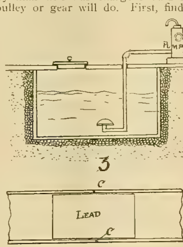
That electrical machinist is the most effective who slowly goes to a machine, quietly stands beside it and watches every part, reads every movement and notes every jar and strain before putting a wrench or screwdriver to it. Such a man may sleepily look on for 10 minues, but, nine times out of 10, when he does alter a part no other change is needed, whereas his excited brother, with soiled face and skinned knuckles, will ply the wrench here and there, loosen nuts and screws promiscuously, and is most likely to put the machine in worse shape than it was.

PRODUCING INTERMITTENT EFFECTS.

Certain operations in the electrical shop require an intermitting stamping effect. In Fig. 7 the shaft carries a flanged pulley continuously revolving in the direction of the arrow. Over this pulley is thrown loosely a belt D, one end of which is fastened to the stamping weight A, and the other end is secured to the floor at F. The weight is guided in parallel uprights and rests upon the base C. As the apparatus stands, the weight is not lifted, owing to the slackness of the belt, but by taking hold of the belt at G with the hand, and drawing it in a horizontal direction a severe tension is created in the belt on the pulley, which latter lifts the weight at a velocity nearly equal to that of its rim. Relaxing the pull on G lessens the tension, when the weight falls freely back to the base. The base may be utilized as an anvil and the strokes from the weight employed in stamping, etc.

CALCULATIONS.

Every man who has charge should know what each pulley or gear will do. First, find the speed



FIGS. 3 AND 4. THE ELECTRICAL SHOP.

of the shaft. Suppose the speed of the main driving shaft is 300 revolutions a minute and that the pulley on the main shaft is 23 inches in diameter, driving a pulley on the motor shaft 20 inches in diameter. Multiply the speed of the main shaft, 300, by the diameter of the pulley on the main shaft, 23, giving 6,900, then divide by the diameter of the pulley on the motor shaft, 20; $6{,}900 \div 20 = 345$ revolutions of the motor shaft.

Electric Light at the Omaha Exposition.

The illumination of the grounds and buildings of the great exposition for which Omaha is now preparing will be profuse and artistic. The fact that Luther Stieringer, the lighting expert of the World's Fair, is consulting electrician for the Omaha Exposition company is a guarantee that the lighting effects will be of a character in keeping with the scope of this great Trans-Mississippi exhibition. Not less than 2,155 kilowatts in dynamos and transformers have already been ordered from the General Electric company for purely illuminating purposes. In detail the contract covers four 125-light (2,000 candle power) Brush arc dynamos of the multi-circuit type; four 120 kilowatt and two 18-kilowatt, alternating-current, high periodicity dynamos, operating at 1,040 volts, together with 840 kilowatts in transformers of various sizes. Current for various power purposes will be supplied from a generator of 225 kilowatts capacity, operating at from 500 to 550 volts. The arc lamps will number 600, of 2,000 candle power each. These are to be of either the double or single carbon type, at the option of the manufacturing company, but if the latter are used they are to be arranged for 14 hour service. The contract also calls for the necessary exciters and all the switchboard appliances for the operation of the above machines.

American Street Railway Association.

The following circular has been issued to supply men by Secretary Penington of the American Street Railway association, with the approval of President Lang:

"The American Street Railway association will hold its seventeenth annual convention at Boston, Mass., on Tuesday, September 6th, continuing in session four days.

"The exhibits and displays of the supply men are so important a part of our conventions that the executive committee, in making arrangements for the meeting, have been as mindful of our wide-awake allies, and as zealous in providing for their convenience and accommodation as for any other feature of the gathering. We have held an executive session at Boston, and give you in this circular the substance of the arrangements we have made in your interests.

"The exposition will be held in the Massachusetts Charitable Mechanics' Association Hall, the largest exposition hall in the country. We will have at least 60,000 feet of floor space, with all the light, heat and power needed. Every applicant is assured that he will get all the space desired, as our resources in this direction are unlimited. The convention will be held on the second floor of the Exhibit Hall, all stairways leading up from the inside, thus insuring the attention of all delegates and visitors to the exhibits.

"The income from sale of space will go to the American Street Railway association. The executive committee of the association has fixed the price at 10 cents per square foot, and ruled that no space of less than 100 square feet will be assigned, but applicants may have as many multiples of this quantity as they may wish. Payments for space should be made to T. C. Penington, secretary and treasurer of the American Street Railway association, 2020 State street, Chicago. Applications for space should be made to Charles S. Clark, 8 Oliver street, Boston, Mass., chairman of the committee on exhibits.

"The Mechanics' Hall association will not allow any nails or screws to be driven in any floor, woodwork or plaster in the building, so those exhibitors who desire to erect booths must govern themselves accordingly.

"All articles intended for exhibition shall be delivered at the building by the agent or owner, and at his expense, but the local committee have made arrangements with Robert S. Brine & Co. to haul and deliver all shipments to the building, if directed in their care.

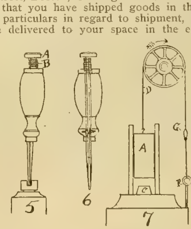
"All electrical connections for power and extra lights must be made at the expense of the exhibitor, and no connection will be permitted except by workmen approved and with the consent of the superintendent of exhibits.

"We expect a large exhibit and perhaps it would be in the interest of the exhibitors to make arrangements to have the building open in the evening, as it is well lighted and the electrical companies expect to make a large display.

"Space must be applied for by August 1st. Assignments will be made as promptly as possible after that date and exhibitors notified of their location. Exhibits of like character will be grouped together and space will be assigned in the order of application.

"It is earnestly requested that all exhibits shall be in place and all work finished by Monday evening, September 5th, which is the evening prior to the opening of the convention. Watchmen will be in charge of the premises, so that exhibits will be safe.

"All goods should be marked to yourselves, 'Mechanics' Building, care of R. S. Brine & Co., 33½ India street, Boston,' sending them bill of lading or advice that you have shipped goods in their care, giving particulars in regard to shipment, and they will be delivered to your space in the exhibition



FIGS. 5, 6 AND 7. THE ELECTRICAL SHOP.

hall. Ship all goods early to insure delivery in time.

"The headquarters of the association will be at the Hotel Brunswick. Hotel Vendome is managed by the same parties, and will be used in connection with the Brunswick. The rates at the Brunswick and Vendome, on the American plan, are \$4 per day and up; Copley Square, Nottingham, Victoria, Turaine, Parker, Young's and Thorndyke, European plan, \$2. The first five mentioned are within five minutes' walk of the hall; the others are downtown, with street cars to the door of the hall. The executive committee advises all who desire rooms

to apply at once, as the rooms at the Brunswick and Vendome are limited, but no rooms will be assigned until March 15th, and will be assigned in the order in which applications are received.

"The executive committee found the Boston brethren so enthusiastic as to the coming meeting, and so hospitable and seductive in their greeting, that success is assured, the location being central and accessible, and the inquiries and information already received being so encouraging, an unusually large attendance seems guaranteed.

"The annual dinner will be held at the Hotel Brunswick, Thursday, September 8th, at eight o'clock p. m. Tickets will be sold at the actual cost to the association.

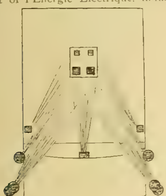
"The railroads will sell tickets on the certificate plan. Be sure and leave your certificate with the clerk the first day of the convention, when you register; it will be signed, vised and ready for you on Thursday, September 8th."

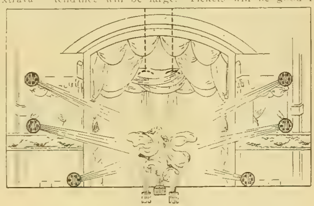
New York Electrical Society.

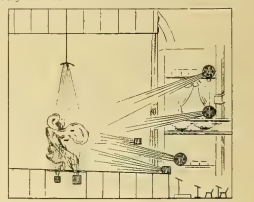
The 185th meeting of the New York Electrical society was held in conjunction with the New York section of the American Chemical society, at the College of the City of New York. Mr. Joseph Wetzler lectured on "Electricity Direct from Carbon." Dr. Charles F. Chandler, Dr. Morris Loeb, Dr. E. A. Doremus, Messrs. Samuel V. Essick, C. O. Mailloux, J. J. Carty, T. C. Martin and Max Osterberg took part in the discussion. The following-named members were elected: Prof Robert Ogden Doremus, Max Loewenthal, James H. Bates, Raymond W. Charles, W. L. Hedenberg, Frank Martin, F. A. Pattison, George C. Hoffman, Thorburn Reid, Robert Lozier, Prof. Sidney H. Short, George Sommer, John J. Swann, Meyer S. Blumberg, Frederick W. Young, Wesley Gray Gilmour, Edwin Adelbert Howe, H. F. Sanville.

Electric Lighting and Fancy Dancing.

The writer of "Chronique Fantaisiste," a department of l'Energie Electrique, indulges in extravagant praises of the young American dancer, Miss Loie Fuller. Much of the effect produced by the graceful dancer may be credited to the arrangement of electric lights and projectors with colored screens skillfully manipulated. One of the dances is described as giving the illusion of an immense flame of punch, and in another the dancer so disposes her costume that "she converts herself into an immense butterfly" with a multitude of tints, which, by aid of the electric lights, serve to heighten the illusion. The crowning feature, however, was the representation of a gigantic lily of the purest white, almost blazing beneath the light of 15 arc projectors. The manipulation of the lights by which these effects are produced will interest the reader, and will be understood by reference to the accompanying diagrams.







ELECTRIC LIGHTING AND FANCY DANCING.

The lamps below the stage are placed about three feet from the glass upon which the dancer stands. They are four in number. The two nearest the orchestra take 30 amperes each and the others only 15 amperes each. Above the stage are two lamps of 15 amperes each, the rays of which are concentrated with the four mentioned. At the right of the orchestra there are three lamps of 15 amperes, one on the stage level, one on the first balcony and one above that at the stage box floor. Two lamps of 15 amperes are placed on the stage, right and left of the curtain, about $5\frac{1}{2}$ feet from the floor. Finally a lamp of 20 amperes is placed at the side of the orchestra leader. The equipment therefore comprises two lamps of 30 amperes, one of 20 amperes and 12 of 15 amperes, making a total of 260 amperes, which at 115 volts represents a consumption of 29.9 kilowatts.

All these arcs are controlled by hand regulators and are mounted in multiple on the Edison central system. The lights are not used constantly. In the lily dance only are all burned simultaneously and the current consumed represents about 35 horsepower.

To handle these 15 projectors not less than 18 men are employed, forming a well trained band, each of whom aspires to the title of electrician.

Naturally the effect of this flood of intense light upon the eyes is harmful and those who have been subjected to it complain of severe headaches

Philadephia Central-station Companies Combine.

It is stated that the consolidation of the electric light companies of Philadelphia has been practically perfected, and that the few companies which have not yet gone into the consolidation will in all probability do so in a short time. The consolidation has been arranged through the Pennsylvania Heat, Light and Power company, or rather by the controlling interests of that corporation. The consolidated interests will be vested in a new operating company, the Pennsylvania Manufacturing, Light and Power company, which has been incorporated under the laws of New Jersey and has an office in Camden and a main office in Philadelphia. This company is organized with a capital stock of $15,000,000. It will also issue $15,000,000 of 50-year five per cent. gold trust certificates to be used in purchasing the stock of all the electric-light companies in the city. This amount, it is estimated, will be sufficient for that purpose.

The International Convention.

The international electrical convention at Laredo, Texas, will be held next week, from the 9th to the 12th. All visitors are urged to be prompt in attendance at the opening session at 10 a. m. on Wednesday, March 9th. For this meeting the International and Great Northern Railway company and connecting lines in Texas, New Mexico, Oklahoma, Arkansas and Louisiana will make rates based on the 167-mile-distance plan, as follows: Less than 100 miles, $3 for round trip; 100 to 167 miles, $5 for round trip; beyond 167 miles, one cent per mile each way added to the rate of $5 for that distance. Thus if one is 167 miles from Laredo it will cost him $5 for round trip; if 200 miles, $5.66 for the round trip, and so on. This is the lowest basis used for any organized meeting. Visitors, as well as members of the associations, can take advantage of this rate, and it is expected that the attendance will be large. Tickets will be good for eight or 10 days. Return limit may be extended at Laredo for those who wish to visit the interior of Mexico.

National Electric Light Association.

The date for holding the annual meeting of the National Electric Light association at Chicago has been fixed for June 7th, 8th and 9th. The sessions will be held at the Auditorium, which will be the headquarters of the association during the meeting. The banqueting hall has been secured for the meetings. Secretary Porter, during his recent visit to Chicago, arranged the details for the convention, and the executive committee has since approved the plans.

President Insull is now engaged in preparing the programme for the meeting, and he promises that it will be of unusual interest, as several live subjects will be considered.

Storage Batteries for Chicago Fire-alarm Service.

In accordance with his scheme to replace about 2,000 gravity cells with storage batteries to furnish current for the fire and police telegraph circuits of the city of Chicago, City Electrician Ellicott received bids on February 26th for 900 cells of secondary battery of 10 ampere-hour capacity and 300 cells of 150 ampere-hour capacity. The Police Telephone and Signal company of Chicago offered to supply chloride accumulators for the whole outfit for $4,350; the American Battery company of Chicago tendered the installation complete for $4,500, and Sipe & Sigler of Cleveland put in a bid of $1.20 each for the 900 smaller cells. All bids were furnished with the guarantee that the yearly cost of maintenance for the batteries should not exceed $7\frac{1}{2}$ per cent. of the first cost. It is estimated that by replacing the existing primary batteries with storage cells, the city will save at least $5,000 a year by reducing the expense of keeping up the plant.

The contract for the larger batteries was awarded to the American Battery company for $3,150 and for the smaller cells to Sipe & Sigler for $1,080, making the total cost $4,230.

Pan-American Notes.

Complaint is made by importers in Buenos Ayres, Argentine Republic, of the condition in which the electrical apparatus shipped to them arrives, owing to the injudicious manner of packing. An instance is cited of an American firm having sent a large number of incandescent lamps to that market, which upon arrival were found to have suffered a large per cent. of breakage. Simultaneous with this complaint the statement is made that similar shipments from England had arrived in much better condition. The importance of this matter is manifest.

The Western and Brazilian cable, between Pernambuco and Ceara, and the Amazon cable, extending from the mouth of the river to Manaos, which have been broken for some time past, have been repaired and messages are again transmitted regularly.

The government of Guatemala has recently promulgated a decree admitting electric batteries, uncharged, intended for public use, free of duty. Galvanized iron wire and insulated copper wire for electrical purposes and electrical apparatus are subject to a duty on the basis of their gross weight. Guatemala, like other countries, is introducing in its principal cities the system of electric lighting.

The syndicate operating the street railways of Mexico is preparing to introduce electricity as the motive power. The company owns about 140 miles of road, and it is purposed to equip the entire line, including the connection from Guadalupe to San Angel, with electric power. It is estimated that the total cost of the new service will be about $5,000,000, and opportunities will be given all electrical manufacturers to bid on it.

The system of lighting the city of Lima, Peru, by electricity is beginning to be adopted, and it is thought that within a comparatively short time it will supersede the present mode of lighting by gas altogether, both for private and public use. Many of the other principal cities of the republic are interested in this subject, and the opportunity for American manufacturers of electrical apparatus is very favorable.

The concession which was granted in July, 1896, for installing an electric-tramway system in the city of Caracas, Venezuela, has been declared forfeited, owing to the failure of the concessionaire to comply with the terms. At present Caracas has a very imperfect street-railway service, and the lapse of the former grant opens a desirable opportunity for American capitalists interested in the promotion of such enterprises.

American Institute of Electrical Engineers.

Last week's meeting of the Institute was attended by about 75 members and guests. A paper on the "Single-phase Induction Motor" was read by Mr. Steinmetz and was discussed by Prof. W. S. Franklin. Dr. A. E. Kennelly, E. E. Ries, Townsend Wolcott and others. At the meeting of the executive committee in the afternoon the following-named associate members were elected: Frank Broili, San Francisco, Cal.; Samuel Byington Libby, West New Brighton, N. Y.; Otto T. Louis, New York city; James A. Mortland, Cedar Falls, Ia.; Charles H. Schum, New York city; C. E. Sedgewick, San Francisco, Cal. William Goltz of Milwaukee was transferred to full membership.

COMMUNICATIONS.

Dynamo Catalogues Wanted.

To the Editor of the Western Electrician:

I would like catalogues of dynamos and motors, as I am in the market for this class of material.

R. ANDERSON.

Chicago (69 Twenty-third street), February 23, 1898.

Electrical Reduction of Ores.

To the Editor of the Western Electrician:

I have control of fine water power within easy reach of rich zinc, copper and lead lands. I wish to investigate the electrical reduction process as applied to these ores. I would like to correspond with gentlemen who can give me this information.

ROBERT A. MOORE.

Springfield, Mo., February 23, 1898.

Western Electrician.

EVERY SATURDAY.

PUBLICATION OFFICES:

Suite 510 Marquette Building, CHICAGO.

TELEPHONE, MAIN 1746.

EASTERN OFFICE: 108 TIMES BUILDING, NEW YORK.

Trade Supplied by Western News Co.

COPYRIGHT.—Not only the title but the *entire contents* of each number of the WESTERN ELECTRICIAN are copyrighted. This paper is entered at the Chicago postoffice as mail matter of the second class.

SUBSCRIPTION, in advance, postage prepaid, $3.00 for a full year of 52 numbers; in clubs of four or more, $2.50, with free extra copy for eight subscriptions; foreign countries, $5.00 a year; single copies, 10 cents. When change of address is requested, the old address as well as the new should be given.

CORRESPONDENCE relating to electricity or any of its practical applications is cordially invited, and the co-operation of all electrical thinkers and workers earnestly desired. Clear, concise, well written articles are especially welcome; and communications, views, news items, local newspaper clippings, or any information likely to interest electricians, will be thankfully received and cheerfully acknowledged.

ADVERTISING—THE WESTERN ELECTRICIAN—**the only general electrical paper published in the West**—thoroughly covers a territory *exclusively its own*. THIS IS A CLAIM WHICH CAN BE MADE BY NO OTHER ELECTRICAL JOURNAL IN THE UNITED STATES. Electrical merchants and manufacturers *desiring western trade* will appreciate the UNEQUALED VALUE of this journal as an advertising medium in its special field. Advertising rates are moderate, and will be furnished on application.

The circular issued by Secretary Penington to the supply men on behalf of the American Street Railway association is printed elsewhere this week. The executive committee has been especially attentive to the wants of that influential auxiliary this year, and in return it is expected that the exhibition in connection with the Boston convention shall be the most pretentious affair ever conducted by the organization.

If it is true, as the London Electrician asserts, that "there is a splendid field for British-made electric-traction plant in America, as every electrical manufacturer in this country well knows," it must be admitted that the field has been woefully neglected. The "British-made electric-traction plant" is not known here, and yet there are many electric railroads. Perhaps our contemporary's say-so was "writ sarkastic."

Announcement is made elsewhere of the dates selected for the annual meeting of the National Electric Light association, and members of that body and others who are interested in it will begin to form their plans so as to enable them to attend. The fact that Chicago is the meeting place has already determined many to attend who might otherwise stay away. This city is to-day one of the greatest electrical centers of the world, if it does not occupy the foremost position exclusively. In many respects, indeed, it may justly be accorded that distinction. The electric lighting interests are well represented here, and the methods employed in conducting the business of generating and supplying current will form an interesting subject for central-station men in other parts of the country.

The time selected should also prove advantageous to the association, as it will enable many to devote what may be termed their holiday time to this visit. They will find the trip both entertaining and profitable, and will be well repaid for any sacrifices they may make. Everything seems to point to an unusually large attendance this year.

Now that the date has been fixed other details will be taken up at once, local committees will be appointed by President Insull and the programme will be arranged. Entertainment will be provided for visitors and all will be assured of excellent accommodations in every respect, an advantage that has not always been enjoyed at conventions of electrical bodies.

An ingenious Russian engineer has suggested to one of the scientific associations of St. Petersburg a plan of construction of aerial lines that has attracted considerable attention. He proposes a suspended electric railway which will be constructed at an elevation of 10 to 21 feet above the level of the earth. The carriages will move on rails fixed to brackets on columns or pillars. As there will be double tracks, trains moving in opposite directions cannot interfere with each other. The speed at which such a road could be operated with safety has been estimated at 200 miles per hour. The inventor suggests three applications or distinct types of his system, the first being for small parcels and postal packages, the second for merchandise of bulkier character and medium weight, and the third for packages of greater dimensions and for passenger service.

The construction of the first-named type would be inexpensive and without difficulty, and the low cost of operation would also recommend the system. Of course for longer routes the expense of construction and operation would increase because of the greater demand for current. The second type would be for general freight traffic, and the third form, which would serve for freight and passenger service, is more interesting than either of the others. The weight of the cars loaded is estimated at 600 pounds, and the speed to be maintained 200 miles an hour. The passenger coaches will contain 20 persons. The windows in these are to be placed at the ends of the coaches only, to prevent nervousness on the part of passengers.

Discussion of methods of teaching employed in the technical schools of Germany is occupying considerable attention in educational circles. Professor Adolf Slaby of the technical high school at Charlottenburg contends that the universities have had no direct share in the application of science to industry, and in support of his position he relates an excellent story upon von Helmholtz. He says: "Practical teaching is abhorred by the professors at most of our universities. I recollect atending a lecture by Helmholtz where I expected him to give some explanation of the dynamo. After making some theoretical observations he merely said: 'Acting on these principles people have constructed some very ingenious machines called dynamos, for engineering purposes.' That was all Helmholtz would deign to say about the dynamo."

According to Prof. Slaby the professors of to-day are just the same in this respect. Their teaching is purely scientific, philosophical, philological and historical, and has not varied for three centuries. He admits that the greatest discoveries in physics have been made in the university laboratories, but the application of these discoveries has been neglected by the universities. Pure science is their aim, and those who, without concerning themselves with studying the phenomena of nature, devote their whole efforts to giving their pupils the means of turning science to practical account are despised by the university scientists. Prof. Slaby's complaint is reiterated by many eminent authorities throughout Germany, and his position has many supporters among those who have examined closely the system of education adopted in the German universities.

Plans have been prepared by the Chicago City Railway company for the extension of several lines and the electrical equipment of others now operated by animal power, for which improvements and additions it has already secured franchises. Additional ordinances are now pending in the council for still further extensions of the company's electric system, and permission has been asked for the temporary equipment of the down-town cable lines with the overhead trolley to enable the company to give uninterrupted service during the period occupied by the track-elevation at Sixteenth street. Mayor Harrison has notified the company that its request for permission to string overhead trolley wires on Wabash avenue, State street and Michigan avenue, in the heart of the down-town business district, will not be granted. He contends that the electric cars can be hauled down-town as trailers by the cable cars, but according to Superintendent Nagle of the South Side company this plan is impracticable for two reasons: First, he says the present power plants of the cable system are taxed to their full capacity and the building of additional power houses for this temporary work would be out of the question; secondly, the number of cars operated on the trolley lines has grown so great during the last two years that to attempt to go back to the old method of handling this traffic would merely invite certain blockade of the entire system during the busy hours when the transportation facilities are mostly in demand.

Interest in the problem is increased by the suggestion that opposition to the trolley would at once disappear if the people had an opportunity to judge of the merits of the system by actual experience. The subject has more than local interest, as the present movement against admitting the trolley even temporarily on the principal streets in the down-town business district is recognized as the culmination of the effort to create public sentiment adverse to that method of propulsion under the conditions that obtain in this case. While it is a fact that the trolley has already invaded the business district of Chicago, as well as other large cities, it is also true that it has been excluded from the busiest retail districts. Once admitted, it is feared by the opponents of the system, it will be no easy task to dislodge it. It is recognized that superior service could be given by the trolley, and this improvement, it is feared, might influence many who are now opposed to the stringing of overhead wires to withdraw their objections.

It is not clear just how the mayor can withhold the permit requested by the street railroad company for temporary occupancy of the streets with its trolley lines without inflicting great hardships upon a large class of people. It is thought by many that the mayor is really hopeful only of compelling the company to make certain concessions as a return for the privileges it now seeks.

Economic Effects of Present Copper Production.

By Franklin H. Wentworth.

Life, under ordinarily onerous conditions, is pursued by artisans and followers of the liberal arts and sciences with but scanty attention to the economic phases of their professions. Abstract reasoning is to most men an impossibility. The result is that the great majority of them accept conditions as they find them and struggle merely for individual supremacy. It is not contended that this struggle does not make for high specialization of industry, or that competition is not a desirable, nay, a necessary factor in all civilization that trends upward. Socialists ignore this fact and regard competition as an evil. As a class they may be said to represent purpose without knowledge. All clear thinkers now, however, distinguish between unrestricted and restricted competition, and the latter is rightly regarded as an evil. Whenever natural opportunities are open to mankind it follows that employment and a living are possible to each individual, and he of the larger brain, greater brawn, or other inherent superiority, takes his place naturally at the head of the procession. Men do not begrudge success to real superiority.

When Edison's discoveries made incandescent lighting commercially possible there was created a sudden and imperative demand for electricians. In consequence, mechanics of every degree of intelligence and competency quickly arrogated to themselves the dignity of this title. The early balance sheets of purveyors of electrical energy are interesting for what they do not show. The present economies practiced in central-station management were undreamed of 10 years ago. In obedience to the law of supply and demand intelligence flowed in this direction. Colleges and universities quickly responded with new or enlarged electrical departments, and the intelligent electrical engineer soon began to displace the destroyer of armatures and drive him back to his simple mechanics. The efficiency of generating apparatus was heightened by improvements in design, electrical publications gave preferred space to articles upon the economy of central-station operation and management, and the entire business, from the water and coal supply to the filament of the incandescent lamp, was subjected to the closest scrutiny, with the purpose of reducing the cost of operation to the lowest point possible.

Although, of course, greater economies may be practiced in large stations operating large units and with their fields of distribution within short radii, it may be said that, considering the character of present generating apparatus and the methods of its operation, central stations in general have attained a high degree of efficiency and economy of management. Capital, in possessing this known factor, may, therefore, with a given cost of fuel delivered at the furnaces, make comparisons as to distribution of population in districts to be supplied with current and calculate with a fair degree of accuracy its probable investment return.

A review of statistics obtainable shows that only in large cities does electric lighting and power supply bring a return sufficiently great to prove really attractive to capital. There is profit in large quantities of current supplied to consumers at comparatively short distances. Why? Because the investment in copper feeders is not so great as to demand too large a portion of the station's earnings for the interest account. In the smaller cities the extension of central-station service practically ends when the progressive merchants in the business district have been secured as customers. Generally in such cities not five per cent. of the residences are lighted electrically. This is not because the householders fail to recognize the superiority of the incandescent lamp as an illuminant, but because its cost renders its use comparatively prohibitive. It is generally conceded that the introduction of electricity for lighting has not impaired the profits of the gas industry, but, on the contrary, has materially increased them. People have been educated to use more light, and where the incandescent light has replaced the gas burner in one place it has promoted the use of two burners where one was before considered sufficient. The sale of the current consumed by a thousand incandescent lamps burning in residences should be as profitable as that consumed by a thousand burning in stores, the loss in resistance of conductors being equalized for the greater distance from the station by a proportional increase in size of feeders. Central-station managers, however, agree that they cannot light residences to any appreciable extent because the outlay for copper necessary for residence distribution makes such service commercially impossible. When every economy possible has been practiced at the station, when all the paying business in sight has been secured, or at least struggled for, when money has been sunk in vain attempts to compete with gas upon the same basis, and when apparently nothing further remains to do but to accept the situation and try to live in spite of unsatisfactory balance sheets, the thoughtful central station manager becomes unconsciously an economist. In other words, he begins to contemplate the business of electric lighting generally, and attempts to sum up its possibilities and measure its retarding influences, irrespective of local conditions. At this point he becomes of value to society as a whole. The same point is reached by the electrical engineer when, having compared the really small number of technical schools and the number of students graduated from them with the almost limitless possibilities of electrical development, he ceases his silly twaddle about the schools turning out too many electricians, and seeks for the causes which stand in the way of their employment. The central-station manager now divides his economic problem into three primary factors—fuel, translating media and medium of delivery or distribution. Taking up the first of these factors, he sees that he is paying a monopolistic tax both to the owners of coal lands and to the transportation companies. He reads the newspapers and clearly sees that this excessive tax upon his fuel is used for dividends on capital stock which does not represent tangible assets, but which derives its value from the power to monopolize part of the earnings of his central station. Of course he shifts this tax upon the consumers of current, but not all of it. His business suffers if his prices are too high; so he must pay part of the tax himself by accepting more modest wages of superintendence, or by cheapening his help. The latter policy is, of course, reactionary for obvious reasons. At this stage of his inquiry he may have a glimmering idea of the ethical side of production, and wonder why the Creator furnished coal to a few men when all men need it; but it is only a momentary thought, quickly dismissed as socialistic in tendency. Then, too, he sees that he is not the only sufferer. Every fellow manufacturer, whatever he may be producing, pays the same tax, and, like himself, is unable to shift all of it upon the consumer or upon his help. Turning then to the second factor, or translating devices, he sees that he here too pays a tax over and above the cost of production and a legitimate profit on capital invested; but he sees that in this factor the tax is due to the legal monopoly of the patent, which he believes to be a justifiable monopoly, necessary for the encouragement of invention. This brings him to the third and final factor of the problem, the medium of distribution, and he finds here a monopoly, similar in character to that of coal, but which, unlike the latter, does not operate upon all producers alike, but constitutes an excessive and discouraging tax upon electrical industries alone.

The present price of lake copper is 11 cents per pound, although it is conceded that it could be produced at a very good profit to mine owners at six cents. Taking the famous Calumet and Hecla mine of Upper Michigan, we learn that during last year a dividend of 45 per cent. was paid to its stockholders, payments being made quarterly. This enormous profit is, of course, mainly due to the richness of the copper vein, the private ownership of which, with others, constitutes a monopoly. The Dingley bill places a duty of 2½ cents per pound upon foreign copper, hardly necessary as a protective measure, one might think. This same company, besides its dividends and expenditures for betterments during the year, has erected a club building for its employes at a cost of $20,000. No capital, subject to competition and unassociated with privilege, can yield in normal times more than five per cent. per annum; hence eight-ninths of the 45 per cent. dividend of the copper company represents merely the power to lay the entire electrical industry under contribution to that extent. The erection of a $20,000 building for employes is a creditable thing; better far than spending that amount in riotous living; but, economically considered, the company does not pay this money; it assesses the amount upon consumers of copper and merely directs its expenditure in the manner stated. Owing to the rapidly increasing use of electrical machinery, copper is becoming an indispensable factor in the industrial world. Its abnormal price will, of course, continue indefinitely to operate as a restriction upon the industry of all the people, for the benefit of the small number of men controlling its output. The manufacturers of wire and electrical machinery must of course add the full cost of copper to their products and thus shift the tax onto the central-station manager and the consumer. The conversion of the copper ingots into commercial forms must be done at the least possible expenditure for labor in order that the manufacturer may compete with the other manufacturers. Thus wages tend to the lowest point at which it is possible for electrical workmen to live. A rise in the price of copper means loss to the manufacurer, or he must recoup by cutting wages. This may precipitate a strike, that most unintelligent and useless of all useless things. For economically it is not an issue between labor and capital, but an issue between labor and capital on one side against monopoly on the other. This is what economists mean by restricted competition. So long as labor and capital are denied free access to the resources of the earth, from which all wealth is obtained, free competition is impossible. As has been indicated, electricians will continue to struggle against one another for a livelihood, denouncing the colleges for their fecundity and assigning other superficial and unintelligent reasons for the stress of living, until competition becomes finally so restricted as to make the conditions of employment too onerous to be borne. They will then begin to think, and slowly get at the real economic bearings of their professions.

What is the real remedy for economic conditions under which it may be impossible for many worthy electricians to find employment and for many central-station managers to live? Is it the socialism which demands that all ore and coal mines shall be controlled and operated by the general government? To assent to this is to exhibit a stupid misapprehension of the real functions of government. Our republic was not designed to restrict, but to leave free. Every individual should be free to acquire whatever his intelligence and natural advantages may enable him to secure, so long as he does not infringe upon the rights of his fellow men, who should enjoy the same freedom.

We see that the holding of copper, coal and other mineral lands out of use, in order to obtain extravagant prices to enrich a limited number of men, operates to retard the development of industry, and thus does really interfere with other men in their effort to make a living in their chosen professions. Government should, therefore, not add restrictions, but remove them, just in so far as they operate to the benefit of some men at the expense of other men. Such governmental action would leave men free to employ themselves, which is just and right. This desideratum could not be obtained by creating new and false functions of government, but by simply changing the method of applying an already clearly established and necessary function. We at present tax all machinery used in production. If a mining company purchases a new pump, hoist or other machinery, its tax is increased. Why do we do this? Do we wish to restrict production? If we tax dogs, dogs decrease in number. There is no doubt as to the economic effect of the operation of any tax. We will never succeed in increasing the output of copper by jumping upon the man who attempts to do what we really want him to do—dig more ore from the earth, and use more labor and machinery in doing so. But if we simply take the tax off all machinery of production and put it upon the value of land, it will encourage the owning and using of mining machinery, and discourage the holding of rich mining land out of use. For in order to pay the tax upon the value of the land the mining companies would have to produce industriously, employing more labor and machinery; they could not hold valuable mining land out of use, for the reason that the taxes on the value of the land held unproductively would eat up the profits upon the limited amount of ore they were producing. They would have to get out the ore to pay the tax upon the value of the land. Increased production would necessarily follow. Ore would be cheaper, and the restriction now operating to retard the development of electrical industries effectually removed.

There is another economic effect due to the present monopolization of copper production which is of uncommon interest and value. When we find a great stone in the way that seems too great to remove, we straightway set about to make a path around it. The present high price of copper has proven a stimulus to inventors to bring out many ideas that would have lain dormant with low-priced copper. This shows encouragingly in the development of polyphase systems, and in the comparatively rapid progress in all high-potential work, which alone has, so far, made long-distance transmission commercially possible. It must be plainly seen that all such development is a direct result of attempts to evade the tax of the copper producers, which is an added proof of our proposition that a tax always operates to discourage the use or possession of the thing taxed. There is but one single exception—a tax upon land values. When thus applied it stimulates production and discourages the holding of land idle. In other words, it promotes the best use of the earth for the benefit of those living upon it at any given time, thus coinciding with the ethical idea.

Mexican Telegraph Service.

In a recent report to the State Department at Washington, Consul-general Donnelly of Nuevo Laredo says that an interesting phase of government ownership is being presented in Mexico, where the government operates a telegraph line of its own in competition with the lines of the several railroads. Advocates of government ownership would doubtless expect the government service to be the cheapest and best, but such is not the case. The railroads give the promptest service and generally lower rates. The following table shows the government and railroad telegraph rates on 10 words from Nuevo Laredo to the cities named:

	Government rate.	Railroad rate.
Monterey	$0.40	$0.26
Saltillo	.60	.51
San Luis Potosi	1.20	1.16
Mexico City	1.60	1.61

As a natural consequence the railroads have done the great bulk of telegraph business, both foreign and domestic.

Consul-general Donnelly announces that by the recent arrangement between the Mexican government and the Western Union Telegraph company of the United States the latter cedes to the government the sole right to that company's Mexican business, and the Western Union, in return, obtains the business of the federal telegraph lines. The government has also issued an order prohibiting the railroads from handling international messages. The effect of this will probably be to deprive the railroads of considerable business, and to give the Western Union control of the international telegraph service.

DEVELOPMENT OF THE TELEPHONE FIELD.

Independent Exchange Management.

By S. A. Duvall.

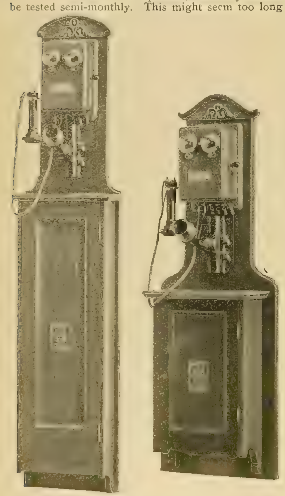
The management of a large opposition telephone exchange differs greatly from the old Bell methods. There are three important points to be kept in view by an exchange manager.

(1) Untiring attention to details.

(2) Unfailing courtesy to the public on all occasions, no matter how trying.

(3) Judicious economy.

In regard to the details of an exchange and the subscribers' stations, it will be found necessary to have a fairly well equipped repair shop. In the first years of the new companies a great many instruments were manufactured with very few of the advantages of patents and experience that now can be had. These instruments can be removed to the repair shop and there be remodeled, one at a time or in lots, at very little expense. Again, where inspectors have failed to put an instrument in good order, and troubles are apt to become chronic, repairs can be made at the shop under the experienced eye of the superintendent. Delicate switchboard cords can be repaired and kept in order. These are the most important functions of a metallic switchboard. Broken or cutting-off cords should never be allowed to remain in the board after notice has been received from the operator, and they should be tested semi-monthly. This might seem too long



MASON PAY-STATION EQUIPMENT.

a time unless a good make of cord is used, such, for instance, as has tinsel conductors with a spiral spring and a tightly woven linen cover, reinforced by another spiral spring and covering extending at least one foot from the connection in the plug.

The circuit charges can also be removed, cleaned and repaired in the shop without disturbing the operator, providing duplicates for one or two sets are kept in stock. This work, of course, comes under the switchboardman's duties. A great deal depends upon having an efficient switchboard or repair man. He should also have charge of and keep in good order the operator's microphones. These in large exchanges should be charged from storage batteries. The writer prefers small cells, having a complete set for recharging. He does not think 48 hour periods are too short; of course larger cells may be used and need be less frequently charged. If the repair man possesses versatility and is not kept too busy, he can act as test clerk, receiving all trouble tickets, locating the troubles found in the exchange, such as a tight annunciator drop, a defective jack or joint, or a blow out fuse. These he can repair himself, thereby saving the lineman or inspector a long and unnecessary trip. A conscientious chief operator is a necessity, one who will not fail to report troubles to the manager. The inspectors must be taught that they can never leave an instrument which they have not satisfactorily repaired. Much trouble can be avoided by the use of good hand cords, those having sealing wax at their terminals should never be used. A good cord should have some means of fastening the weight of the hand 'phone to an eye on the side of the generator box. The tinsel should be soldered to the terminal. Linemen and inspectors in the rapid growth of a new exchange are apt to neglect soldering all joints. In the writer's experience he has found there is nothing "just as good" as a soldered joint. This is not merely a text-book theory.

Inspectors should never fail to be provided with emery cloth. It should be used to clean all connections, especially the microphone contacts in an instrument. Some manufacturers were too economical in using platinum for contact points. The latter should always be well supplied with a pure grade of sal ammoniac and well amalgamated zincs. It is well for new exchanges to spend a few more cents per pound and get the best. Periodical inspection of instruments by districts, at least every quarter, called "service inspection," has been found to be a good means of bringing in delinquent rentals. The inspections can be made by the regular inspectors, who, having a certin district, can perform their duties by being notified through the telephone from the chief operator, who should keep a tally-list and check the reports as they are made by her. This inspection should consist not only in a thorough overhauling of the instruments, but examination of the rapidity with which the operator answers calls. Other points to be noted are whether the telephone is in a good location and the subscriber knows how to use it, also whether he is provided with the latest catalogue, and if he is in need of any auxiliary instruments, such as a desk 'phone or extension bell. The chief operator should keep a book for entering all the complaints, the name of the inspector or trouble lineman who has gone upon the complaint and what time he reported the same adjusted. In regard to a switchboard of 2,000 line capacity, much has been said and written. When the opposition exchanges of over a thousand lines were started there was a great deal of talk about the necessity of a multiple board. It was said that the Bell company was the only concern that had one, and that it had it so well covered with innumerable patents that it would be impossible for an opposition company to have a board of over one thousand lines that would work successfully. Now that has been actually demonstrated to be a fallacy by the number of large independent exchanges scattered throughout the country. The writer does not mean to say that the multiple board used by the Belll company is not a success, but he believes that an exchange with proper sub-offices can give good service, as well as pay good dividends, without a multiple jack board.

An argument advanced by the Bell company is that the larger an exchange grows the more expensive it is to maintain. The reason given for this is thus illustrated: If John Smith is connected to a 100-line exchange the remaining 99 subscribers are maintained for the use of John Smith. If it is a 200-line exchange, there will be 199, if a 300-line exchange there will be 299, and so on. Now to the public this would seem reasonable, but upon investigation a telephone exchange is found to represent a little world by itself. In New York a Fifth avenue subscriber holds very little communication with the Bowery. Hence we find telephone subscribers have their circles of communication, and that the west end of a city has more local communication than calls for the east side. If the manager of an exchange appreciates these facts he may, by properly subdividing his exchange, increase the efficiency of his service as well as the revenue. But these are only a few of the details of a new exchange. If the manager is diligent in attention to details he will find a great many improvements upon the old Bell methods. Lack of courtesy was one fault and is even now a weak point with the Bell. To be answered in a sharp voice. "Well! what number do you want?" and, upon a subscriber endeavoring to report an instrument badly out of order, to be answered "Well, we know what's the matter with your telephone," are not calculated to increase the success of any business or firm, even if it enjoys a monopoly. The manager of a new exchange must always be bland and mild and must instill this manner into all his subordinates. He must instruct his chief operator to give all information possible, such as the numbers of new subscribers, and any information that a subscriber may desire. Courtesy should consist not only in manner, but the needy subscribers should be met halfway in demands for special switches and devices. With a little ingenuity and at a nominal cost, many good friends can be made without any loss of revenue.

In regard to economy it may be said that it does not pay to have deadheads employed in an exchange, or special agents, no matter what their political influence. It is a mistaken idea to compel women to work long hours. Eight hours in a telephone exchange is sufficient, and an operator cannot give satisfactory service after that time, nor should she be employed elsewhere. After the eight-hour limit the most amiable operators may give sharp replies to irritable subscribers and become slow in answering calls. Men do not give satisfaction as operators, as they are apt to become rough in answering calls and in the manner of handling the switchboard. Where there are 40 or 50 employed is is best to compel them to furnish substitutes when absent. The writer has heard of prizes being offered to operators giving the best service and having the fewest complaints during the month. It is doubtful whether this works successfully from a business view.

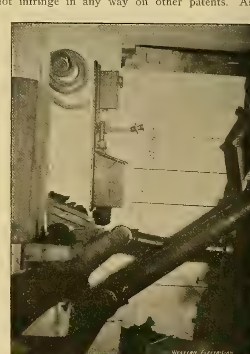
Independent exchanges should employ experienced men, give good service, and success is assured.

Telephones for Mines.

One of the many new uses that telephones are being put to is connecting various sections of mines with the surface mills. The accompanying illustration shows a Stromberg-Carlson telephone in the Stewart mines at Butte, Mont. The instrument is at a pump station 600 feet below the surface, and furnishes valuable service in affording means of communication with other points about the mine without the necessity of making a trip. The instrument was installed by W. I. Jackson, manager of the Montana Electric company of that place. Experts say that mines are probably the most trying places for apparatus of this kind, being continually subjected to dripping of water and dampness from the walls and pipes, and to the roughest kind of usage.

Mason Pay-station Equipment.

Up to the present time it has been impossible for independent telephone companies to secure automatic pay-station apparatus, for the reason that the Bell company has controlled the appliances designed for that purpose. Now the Mason Telephone Pay-station company of Ludington, Mich., offers what it claims to be a thoroughly reliable instrument at a moderate cost, and one that does not infringe in any way on other patents. Aside



TELEPHONES FOR MINES.

from the inconvenience of having to arrange for some person to look after the toll business at pay stations, it has been demonstrated that the business is largely increased wherever this class of instrument has been introduced. This instrument is designed for use in public places, depots, hotels, restaurants, corner drug stores, etc., without attendant. The cuts show a standard wall set with battery space, and another type without battery.

Southeastern Iowa Telephone Notes.

[Special correspondence of the Western Electrician.]

The Jefferson County Telephone company of Fairfield, Ia., has been in operation six months. The company opened its exchange with 57 subscribers on September 15, 1897, and at present it is furnishing excellent service to 123 subscribers.

To obtain a franchise to use the streets, alleys and public places in any city or town in Iowa, it is required that the project be submitted to the voters, under section 776 of the Code of Iowa for 1897.

W. R. Hind and others have been granted a franchise at Mount Pleasant, Ia., subject to the approval of the voters in the coming spring election.

E. T. Keim of the Northwestern Telephone Manufacturing company of Milwaukee is organizing a Home company at Centerville, Ia.

It is rumored that J. C. Hubinger will build an exchange at Muscatine this spring.

Iowa Independent Telephone Association.

The annual meeting of the Iowa Independent Telephone association, composed of the anti-Bell companies in the state of Iowa, will be held next week in Des Moines, beginning Tuesday, March 8th. A good meeting is expected. E. K. Himes of Oskaloosa is the secretary of the association.

Telephone News from the Northwest.

[From the Minneapolis correspondent of the Western Electrician.]

The officers of the American Telephone and Telegraph company at Minneapolis have been cited to appear before the county auditor and make a disclosure of the company's taxable earnings. This is an outgrowth of the action of the state auditor, who sent the company the usual blanks for a return of its property. The blanks were returned with the statement that the company had nothing to be taxed on, as it did only an interstate business. After the disclosure the taxes will probably be assessed and the matter allowed to go to the courts.

The Wisconsin Telephone company is preparing to follow the Wisconsin Valley Telephone company into the northwestern part of Wisconsin, taking in Ashland, Washburn, Bayfield, Sanborn, Mellen, Hurley, Bessemer and Ironwood with a long-distance line.

The farmers in the district around Baraboo, Wis., are arranging to secure telephone connection. A line will be built in the spring connecting with Richland Center and Reedsburg.

The Iowa Telephone company has been granted a franchise by the council of Denison, Ia. The mayor, it is understood, will veto the ordinance.

W. C. Wyckoff & Co. have bought out the Clark Automatic Switch company at Rock Rapids, Ia. The new owners will make some improvements to the system.

The Northwestern Telephone Exchange company has bought the Austin telephone exchange at Austin, Minn., from W. S. Willis, and will make a number of improvements.

H. H. Ashley secured judgment for $500 against the Rocky Mountain Bell Telephone company at Helena, Mont., for damages sustained by the company removing his telephone from his livery stable. He tendered the company the money for current service, but it was declined, owing to a dispute over an old bill.

The South Line Telephone company has been formed at Mount Ayr, Ia., and materials have been purchased for the construction of part of the line.

The Barron County Telephone company of Barron, Wis., proposes to put in local exchanges at Prairie Farm and Chetek, as well as connection with Rice Lake.

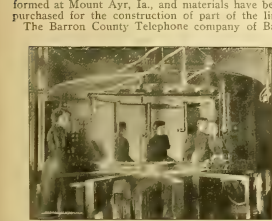


FIG. 1. PEOPLE'S TELEPHONE EXCHANGE, KNOXVILLE, TENN.

The council of Alma, Wis., is considering a franchise for the Fountain City Telephone company.

J. W. Johnston, formerly manager of the La Crosse Telephone company, at La Crosse, Wis., has gone to Menomonie, Wis., to act as superintendent of repairs for the Wisconsin Valley Telephone company.

H. F. and W. S. Proctor of Viroqua, Wis., are working up interest in a local telephone system for Spring Valley, Minn.

Efforts are being made to form a company and build a telephone line between St. Peter and Winthrop, Minn.

The telephone company at Rush City, Minn., has let the contract for material for an extension to Cambridge, Minn., from Stanchfield, and between Grass Lake and Brunswick.

Otto Wertzstein, Jr., of Rochelle, Ill., is an applicant for a telephone franchise in Wadena, Minn.

C. B. Miller of Clinton, Ia., is considering the possibility of securing a franchise for a local telephone exchange at Maquoketa, Ia.

The Wisconsin Telephone company is arranging to rebuild its lines in the vicinity of Baraboo, Wis., putting in long distance and all metallic circuits.

It is reported that the Northwestern Telephone and Telegraph company is arranging to build a toll line from Oshkosh, Wis., to Marquette, Mich.

H. M. Orlady and Dr Gober have completed arrangements to establish a local telephone exchange at Marshall, Wis.

The Midland Telephone company of Ellendale, N. D., is arranging to extend its lines from Aberdeen, S. D., to Manning, N. D. Oakes, Kulm, La Moure, and later to Cogswell and Fargo.

Dr K. W. Droge and others will canvass Marshfield, Wis., for stockholders and subscribers for an independent telephone exchange.

The Wolf River Telephone company is an applicant for a telephone exchange at Omro, Wis. A line is to be extended to Oshkosh from Omro.

The Home Telephone company at Marshalltown, Ia., has won a victory that gives a great deal of satisfaction. The Bell company's instruments were decided upon by the express companies at that point in preference to the Home company, but a visit to Chicago was made and such a strong statement of the case set forth that the order was rescinded and the old company's instruments ordered out. The old instruments have also been removed from the Chicago and Northwestern railway offices in Marshalltown.

Patrons of the Wisconsin Valley Telephone company in Chippewa Falls, Menomonie and other towns enjoyed a concert by telephone recently, the Scalchi company at Eau Claire furnishing the music.

A. W. Stone is arranging to establish a telephone exchange in Bird Island, Minn.

The Barron County Telephone company of Barron, Wis., decided to extend its line this spring to Almena and Turtle Lake.

The Mississippi Valley Telephone company of Keokuk, Ia., is an applicant for a franchise for a local exchange at Muscatine, Ia.

The Northwestern Telephone Exchange company is arranging to make a number of improvements and extensions in the vicinity of Grand Forks, N. D. A new line will be constructed to Crookston, Minn., and lines extended to Park River and Langdon. Northwood and Inkster, N. D., will also be connected.

The city of Neola, Ia., voted bonds for the construction of a municipal electric-light plant.

The street-railway company of Bute, Mont., proposes to change its West Side line to run on Arizona street, from Park to Broadway, on Broadway to Main, and on Main to Granite, thence west to the gulch. The change is favorably regarded and the council will probably give the desired permission.

The council of West Superior, Wis., has appointed a committee to secure plans and estimates of cost for a municipal electric-light plant. C.

People's Telephone Exchange, Knoxville, Tenn.

The peculiar form of the switchboard used in the People's Telephone Exchange at Knoxville, Tenn., which is shown in Fig. 1, will attract attention. It is made by the Swarts Switchboard and Electric company of that city, and is the invention of Henry J. Swarts. Another form embodying the same principle is shown in Fig 2. The special claim for this form of construction is that while all the advantages of a multiple board are gained, that system is not used. A 1,200-line exchange can be equipped so that every subscriber's jack will be within reach of any operator. This board has been in actual use two years, and it is claimed that the service of the Knoxville exchange compares favorably with that of any independent company in the country, especially in point of rapidity.

Telephone Legislation in New York.

[Special correspondence of the Western Electrician.]

Albany, March 3.—At a meeting of the Senate finance committe Senator Brush endeavored to have his telephone bill reported without a hearing, saying:

"The bill has been before the Legislature for years, and the members have a large store of information on the subject which can hardly be added to by any information outsiders might give now. The people are getting restless under the tyranny of the telephone monopoly. It is breeding a spirit of anarchy. It appears to me that this Legislature, knowing that the great majority of the people of the state want this bill passed, should pass it without further ado. It puts no illegitimate restrictions on the telephone companies. It allows them to earn a 10 per cent. dividend, which is all a railroad is allowed to earn under our laws. The only opposition to it lies in the fact that the company has been inflated so that a 10 per cent. dividend on the actual investment, including profits reinvested, would not be more than two or three per cent. on the public value of stock."

The senator's appeal was futile. A hearing was granted to-day.

New Telephone Company in New York.

The Knickerbocker Telephone and Telegraph company which was incorporated at Albany, N. Y., February 19th, with a capital of $7,500,000, will construct and operate telephone lines throughout New York and New Jersey. The directors are Samuel B. Lawrence, Francis P. Lowrey and Charles L. Horton of Manhattan borough, and John B. Summerfield, Henry M. Haviland, George S. Spencer and Henry F. Everdell of Brooklyn borough. The company paid into the state treasury an organization tax of $9,375.

The Telephone in Railroad Operation.

The Panhandle Railway company is putting in telephones at points where improvements are in progress and in this way furnishing means for facilitating the movement of trains without the expense of telegraph operators. Commenting upon this, the Railroad Review says: "This is only one of many cases in which the telephone is crowding out the telegraph, and we may expect many more such."

Married over the Telephone.

[From the Cleveland Plain Dealer.]

There is a general disposition among the leading editors of the nation to speak deprecatingly of the practice of getting married by telephone or telegraph. They claim that it robs a somewhat serious ceremony of its most sacred features, as it were, and that it adds a sensational glare to what should be a grave and decorous function. Aside from these good and sufficient reasons it may also be imagined that marriage lines pronounced over some telephones would scarcely redound to the moral advancement of the high contracting parties. There are telephones that would put a wire edge on the most promising honeymoon.

For instance, suppose a youth is detained in the city by extremely important business, and can't get to the house of his bride-to-be until after the hour announced for the ceremony. Everything is in readiness, however, the guests and the parson and the license are all waiting at one end of the line. What, then, could be simpler than to call the detained youth to the telephone and hurry through the service? It sounds easy, of course, but the youth may not find it so.

Here he is at the telephone.

"Ah, is that you, parson? Yes, all ready. Let her go. Eh, what's that? Yes, we're talking. Go on, parson. Yes, this is George McGoozle. You know my voice, don't you? Say, exchange, can't you stop that idiot from cutting in on us? Excuse me, parson, but there's some blooming chump whose wire must be crossed over ours, and who insists on talking the price of hogs to some other chap. Hello, there! Call off your hogs for half a minute, can't you? How's that? Say, what's your

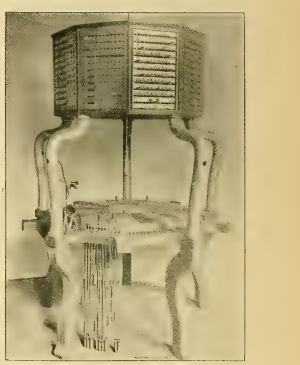

FIG. 2. PEOPLE'S TELEPHONE EXCHANGE, KNOXVILLE, TENN.

number? I'd like to drop around in the morning and level your face for you! Go on, parson. No, I ain't talking to you. Yes, I hear you now. Repeat what you say? Steam ahead. Hang it all, exchange! Exchange! Exchange! What in thunder is that horrible buzzing noise? Eh, a passing motor? How soon will the next one be along? Five minutes? Swing ahead, parson. Repeat? Oh, yes. (Mumbles away. I don't get some of it, but I s'pose it's all right. Eh? Of course I do! Every time. Yes-sir-ee! What? Is it all over? Who-o p! I'll see you later, parson. Oh, is that you, wife? Say, I'll just put a kiss into the receiver—can you hear it? There's that confounded hog man laughing! I'll look you up in the morning—eh? Of course I'll be home before morning. By-by, wife. (Rings off.) Whew! I'm glad it's over."

Telephone Enterprises Valuable Investments.

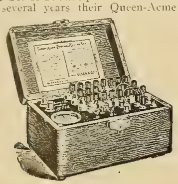
[From the Minneapolis correspondent of the Western Electrician.]

The Wausau, Wis., Telephone company at its annual meeting re-elected all the old board of directors. During the three years the system has been in operation $5,850 worth of stock has been sold and a plant worth $11,000 installed and paid for. Dividends aggregating 30 per cent. have been declared and paid, making the earnings of the company for three years 130 per cent. or 43 per cent. per annum. Telephone rentals have been reduced 30 per cent. for stores and and much more for residences. The company has built six rural toll lines and has a number of others in contemplation for the coming year.

Frank D. Jackson of Bartow, Fla., wants addresses of dealers in and manufacturers of telephone equipment.

Portable Testing Set.

The convenience and accuracy of a well-designed portable Wheatstone bridge recommend it above all other methods for general resistance measurements. It should be compact and complete, requiring no adjustment and having practical immunity from accident or derangement. The range of measurement should be wide and the accuracy as high as will be required in commercial work. Queen & Co. of Philadelphia have had on the market for several years their Queen-Acme portable



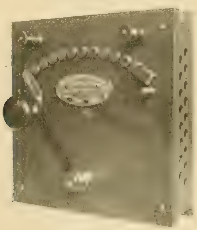
PORTABLE TESTING SET.

testing set, designed to meet the requirements mentioned. How well this result has been secured may be judged from the fact that they are supplying them to the telephone companies and electric-light stations of this country, South America, Canada, Russia and Japan. Their set is in use on all of the vessels of the United States Navy, being approved by the government for that purpose.

Recent improvements of such value have been made in the Queen-Acme as to warrant the manufacturers in calling attention to these advantages. The illustration shows the instrument in its new form. A most important improvement has been made in the galvanometer, whereby the sensibility has been increased six-fold, greatly extending its range of measurement and correspondingly adding to its accuracy. Another improvement has been an alteration in the construction of the galvanometer so as to enable it to withstand transportation without injury. The galvanometer is of the D'Arsonval type, dead-beat, requiring no adjustment previous to using, and unaffected by external magnetic fields or mechanical vibrations. As to the range of measurement, the theoretical limits are from .001 of an ohm to 11,110,000 ohms. Practically, the range is from .01 of an ohm to 5,000,000 ohms. In the case of the lower limit it gives a result accurate to one per cent. When measuring five megohms the accuracy is two per cent. For intermediate values the accuracy is much higher, being throughout most of the range nearly one-fifth of one per cent. Owing to the long galvanometer scale and the flexible arrangements of its connections, the range may be considerably extended beyond that already given. For example, a battery of high electromotive force and a direct-deflection method permits of insulation comparisons as high as 20 megohms. The coils are of special wire, carefully seasoned and adjusted to a considerably higher degree of accuracy than heretofore. By suitable connections the galvanometer or battery may be used independently of the rest of the set, or they may be used jointly in series with the rheostat.

Raster Rheostat.

The newly organized Raster Carbon Rheostat company proposes to utilize carbon compounds with



RASTER RHEOSTAT.

other secret compositions or alloys in the manufacture of resistance for various electrical purposes. The accompanying cut illustrates one of its safety spring catch motor starting rheostats. The officers of the company are: President and treasurer, E. O. Raster; vice president, Arthur Heis; secretary, August Schmatzer; electrical engineer, W. R. Garton. They are young and energetic, and are determined to make a success of their business, being much encouraged by the first few months' experience. The office of the company is located at No. 414 Ashland block, Chicago, and its factory is at 184-202 South Clinton street, Chicago.

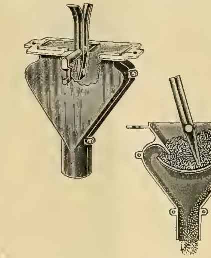
An Improved Sand-box.

The Ham sand-box illustrated herewith and sold by the Electric Appliance company of Chicago is based upon the theory that any box provided with a valve at its bottom is impracticable. If the valve be made tight enough to prevent the sand from sifting through, it will require great force to operate it, while if the valve be loose enough to work easily, it will allow the sand to sift around it. The company also claims that if a pebble gets into the valve slide it will hold it open so that the sand will run out of the box.

In the No. 3 Ham sand-box illustrated all parts are made of bronze metal. The box has an opening, under which is a curved shelf. The ends of the shelf extend beyond and above the opening in the box, so that the sand cannot escape by gravity. A paddle is reciprocated above the shelf, and the movement of the paddle forces the sand in each direction alternately over the ends of the shelf to the feed spout which leads to the car track. Above the paddle are two fingers which stir the sand. The connecting rod passes forward to the car platform, and is operated by a pin and bell-crank lever, or by a hand lever. The working parts are extremely simple and the motions direct. The strokes of the foot or hand may follow each other so rapidly as to practically secure a continuous but small stream of sand, a decided advantage in hill climbing. It can be easily seen that waste is impossible in this box, as the sand flows only when the lever is in motion, and the quantity of sand is regulated.

The sand-hopper inside of the car and directly over the sand-box may be made of any form desired. If the space under the seats is inclosed, a square soap box or any other cheap form of construction may be employed.

Small stones or other small substances will not interfere with the operation of this box, but will pass freely through it. In fact, the company recommends



AN IMPROVED SAND-BOX.

coarse in preference to fine sand, even if it contains gravel stones as large as peas, as it is less likely to pack in the box.

The manufacturers state that they have unsolicited testimonials favorable to the box, received from prominent railroad men.

Electrical Installation under Difficulties.

The far western part of the United States—that is, the part west of the Missouri River—is a country full of enterprise. Fancy a Russian, or even a German or British town of 1,500 inhabitants, ordering an electric-light plant which would have to be hauled over mountainous bridle paths for 150 miles from the nearest railway station before it reached its destination! Yet this is what the town of Lander, in Wyoming, had the courage to do, says a writer in Cassier's Magazine, each mule employed taking 12 days to make the round trip between Bitter Creek, on the Union Pacific railway, and the town whose progress was apparently impeded for want of the latest and most expensive means of artificial illumination. The town of Sheridan, also in Wyoming, had only 600 inhabitants and was 200 miles from the nearest railroad when it discovered that an electric-light plant was essential to a continuance of its self-respect. Accordingly the plant, packed in very small pieces, was hauled 200 miles, and Sheridan was happy. Since then this town has had a streak of luck, for the Burlington railway, pushing its way toward the Yellowstone River, has gone right through it, thereby increasing its population at a single bound from 600 to 1,000. Buffalo, another town in the same state, having 600 inhabitants, thought 44 miles a comparatively short distance to haul its electric-light plant.

In the adjoining state of Idaho, the important town of Lewiston, with 2,000 inhabitants, had its electric-light plant hauled on boats for 80 miles up the Snake River. Murray, with 700 population, had a 60-mile overland passage to accomplish, or about the same length that Silver City, with a hundred less population, hauled its electric-light plant. Turning now to places situated on the railways, it is found that Newcastle, Cambria, Rawlins, Rock Spring, Green River and Evanston, in Wyoming, and Pocatello and Idaho Falls, in Idaho, have each an electric-light plant, though the population of not a single one of these towns exceeds 300. Boise City, Idaho, as befits a town puffed up with 8,000 inhabitants, has not only an electric-light plant, but a system of trolley cars. Moreover, as some natural hot springs happen to be close to Boise City, the citizens heat their houses with the hot water from them, and even raise early spring vegetables by using the hot springs for irrigation purposes. The three small mining camps of Cœur D'Alene, Wallace and Wardner use electricity for lighting purposes all the year round, while their available water power is used to run the mills for stamping ore. But in winter, when the main water supply is frozen, the electric current is connected with the stamping mills, and lighting and power are furnished by a lavish expenditure of coal at $10 a ton.

Consolidated Car-heating Patent Sustained.

Both claims of J. H. McElroy's electrical heater patent No. 500,288 have been sustained. This patent is owned by the Consolidated Car-heating company of Albany, and the litigation was directed against the West End Street Railway company of Boston, which was equipped with electric car heaters by the American Electric Heating corporation, the latter company in reality defending the suit. Last summer Judge Putnam of the United States Circuit Court for the District of Massachusetts rendered a decision holding the American heater to be an infringing device and sustaining the second claim of the McElroy patent, but denying the first on the ground of its identity with the second. Both sides appealed the case, the Consolidated company to establish the first claim. The United States Circuit Court of Appeals for the First Circuit has now broadly sustained both claims of the patent. This decision is one of much importance to electric-railway companies and others using electric heaters.

CORRESPONDENCE.

New York Notes.

New York, March 1.—An interesting announcement is made in connection with the electrical exhibition to be held in Madison Square Garden in May. It has been decided that one or more evenings during the show shall be set apart for a telegraph tournament. This contest will undoubtedly be a great popular attraction, as well as of especial interest to the thousands of telegraph operators in town. The committee has secured the services of Mr. Fred Catlin, who is exceptionally well fitted to successfully conduct an affair of this magnitude. Mr. Catlin is termed "the father of telegraph tournaments," for, with one exception, he has managed every telegraphic contest which has been held in New York since 1866, when Mr. Pat Burns of Boston won the gold key, including the Bunnell key contest, in the Western Union building in 1884, which was won by Mr. W. L. Waugh; the Victor key contest, in the United Press rooms in 1885, won by Mr. J. W. Roloson, and the great national fast-sending tournament at Hardman Hall in 1890. Mr. James D. Reid, the "father of the telegraph," and well known to every operator the world over, has consented to act as chairman of the board of judges. The management will spare no efforts to make this feature of the exhibition a most attractive and successful one. The prizes will be liberal and the contests numerous, and there will be ample opportunity for the young talent which has come into the field since the last tournament of five years ago to show of what stuff it is composed. Mr. Catlin gives it as his opinion that the records will be beaten. The enterprise has the hearty support of the Telegraph Age.

The Holland submarine boat, which is electrically driven by storage batteries and an electric motor, excited a great deal of attention last week during the visit of the Spanish cruiser. Some impetuous people seemed to think that the new boat would most likely distinguish itself by an effort to blow up the foreign war vessel, and its movements were watched accordingly. However, nothing more exciting happened than a successful trial of the boat on Thursday. Mr. Holland, in his boat, was unconscious of the trouble he was causing. He caused the tug Erie to tow him into deep water near Kreischerville, Staten Island, and then he cast loose, and the Holland, after months of experiments, was left to her own devices. She sped along at a rate which gave the tug all she could do to keep near. Then the cap was screwed into the hatchway and the Holland disappeared. She went down about 20 feet, circled about a little and then came to the surface and floated steadily. During the submersion it is said that she lost only a foot of headway. Mr. Holland is reported as saying that he wants a few hard tests of the boat himself, and then he will invite the navy officers to look into her and take journeys under water. He is quite confident that the problem of submarine navigation is solved. He said the boat behaved even better than he expected. Engineer C. M. Morris, who was a little afraid of the new craft at first, was, after the trial, in a most confident frame of mind. "Goes like a fish and dives better than one," was the way he put it.

The Hudson Subway company of this city has been incorporated to construct and maintain subways or tunnels to hold pneumatic tubes, gas and water pipes

and telephone and telegraph wires and cables. The directors are T. F. Lennon, Thomas F. Farrell and Walton J. Aims. The capital stock is $5,000.

The Flushing Electric Light and Power company has certified to the secretary of state an increase of its capital stock from $100,000 to $250,000. The liabilities of the corporation are placed at $151,159.

It is announced that the Henry R. Worthington company of this city, the great power-pump manufacturer, will equip its extensive factory in Brooklyn with electric motors, if a preliminary trial, now undertaken, proves satisfactory.

The officers of the Brooklyn Elevated Railroad company have signed a contract with the officers of the Walker company to equip 150 cars with electric motors. A contract was entered into at the same time with the Sprague electric company to put the Sprague system of multiple control in operation in connection with the Walker motors. Trains on the Brooklyn bridge are already electrically equipped and the Brooklyn Elevated company will be enabled to run is cars on the bridge tracks with very little additional expense, after making the connection at the Brooklyn terminal. President Uhlman of the Brooklyn Elevated road says that many of the cars will be running over the bridge by June 1.

The first contract for the great power house of the Metropolitan Street Railway company has been awarded to the General Electric company. The contract includes five 5,000 horse power dynamos. The installation of these alone will make the plant the largest of its kind, constructed for traction purposes, in the world. The new power house will occupy a space of 201 by 279 feet. About one-half of the building will be given up to the coal bin, boilers and conveying machinery. There will be 87 boilers arranged in three tiers, each having a capacity of 400 horse power. There will be 11 engines of 4,000 nominal horse power, but having a maximum capacity of 6,600 horse power each. The generators, one of which will be connected direct to each engine, will be of the three-phase, 6,000-volt, alternating-current type. W. F. O.

Western New York.

Niagara Falls, March 1.—Recently receivers were appointed for Frank W. Hawley in the Supreme Court and in the City Court of New York. Mr. Hawley is well known in the electrical field for his connection with the Cataract General Electric company, which company holds a valuable franchise from New York state for operating canal boats by electricity. Justice Olcott appointed William H. Shepard receiver, on the application of Oliver M. Farrand, who has a judgment of $576 for jewelry. On the same day Justice Bishoff appointed John M. Shedd as receiver, on application of Charles L. Atterbury, a judgment creditor for $11,259. As grounds for appointing the receivers, it is stated that Mr. Hawley is a director in various companies.

Senator Lamy has introduced a bill in the New York Legislature providing that no street-railway company operating in the city of Buffalo shall hereafter charge more than four cents for a ride. The bill also provides that seven tickets shall be sold for a quarter and that the different companies shall give free transfers to each other's lines at all junction points.

The proposed electric road from Penn Yan to Geneva is thought to be nearly a sure thing. Franchises are likely to be asked for after the spring elections.

The advocates of the proposed extension of the Auburn City railroads west from the city limits to Cayuga Lake still have hopes that the plans will yet be carried into execution, and that Auburn, Seneca Falls, Waterloo and Geneva will be connected by a trolley line. Recently General L. S. Ebright of Akron, Ohio, and Wilson H. Pixley of the same place spent several days in Auburn. At a meeting of the Auburn Interurban Road company, General Ebright was elected to succeed V. S. Lord as one of the directors of the company, and at a later meeting the following-named gentlemen were chosen as a board of directors: George B. Turner, L. S. Ebright, George B. Longstreet, A. P. Rich, E. I. Edgecomb, George B. Leonard, George N. Cheny, Frederick T. Pierson and C. D. Beebe. The election of this board of directors is said to have been the result of an agreement made between General Ebright and Wilson H. Pixley, who had the largest financial interest in the Interurban road, and Clifford D. Beebe, the president of the Auburn City railroad. It is understood that the basis of the agreement is that the Auburn Interurban Electric Railroad company shall lease the lines of the Auburn City Railroad company. The directors have organized by electing these officers: President, George B. Leonard; vice-president, L. S. Ebright, secretary-treasurer, Frederick T. Pierson. Under the arrangement it is believed that the Interurban company will go ahead and build the road from Auburn to Cayuga, for which the Auburn and Western road was formed in 1896 by men prominent in the Auburn company. It is also thought that the line to Skaneateles will be built, the Interurban company having a franchise.

The Weedsport electric light plant, which was to have been in operation by March 1st, will not be ready by that time, on account of delay in the arrival of the necessary poles, which were missent.

A grand combination hotel and theater building is projected for Buffalo, in which Niagara power is to be used for light, heat and power. The plans are under consideration, George K. Birge being at the head of the movement.

The Buffalo General Electric company has decided to remodel its Court-street station, preparatory to placing therein the new machinery to light the city in connection with Niagara power. The old wooden roof will be replaced by a fireproof roof and the building made fireproof in every possible way. It is expected that the new installation will be ready for operation the latter part of the year.

A bill is now before the Legislature authorizing the enlargement of the International bridge crossing the Niagara River between Black Rock and Fort Erie, Ont., and it is said that if the bill becomes law it is proposed to build a trolley line from Buffalo into Canada. The idea is that such a road could be built down the Canadian side to the Falls to connect with the Niagara Falls Park and River railway, and then cross to the New York state side and return to Buffalo via the Ely line, or, if desired, continue on to Queenston and cross there to the Gorge line, over which the return to the Falls could be made. The trolley line would be built on the proposed upper deck of the bridge. O. E. D.

Notes from the South.

Knoxville, Tenn., February 28.—The Knoxville Street Railway company and the Knoxville Electric Light and Power company will expend in Greater Knoxville by October 1st the sum of $100,000 in extending their lines and tracks. The plant of the Knoxville Electric Light and Power company is one of the best equipped in the country. Major C. C. Howell, general manager of both companies, is now in the East negotiating for the sale of bonds.

Gainesville, Fla., has closed a contract with the electric-light company for lighting the streets. Fourteen arc lights and fifty 32 candle power incandescent lights will be used. The plant of the local company originally cost $20,000. It has a capacity of 600 incandescent and 100 arc lights.

Although the Muscogee Mills at Columbus, Ga., are driven by electric power rented from a power plant there, the Georgia factory at Athens is the first cotton mill in the state to generate and use its own electric power. The electric power is generated at a point about one mile below the factory building. There are 11,600 spindles, which will be run by electric power. W.

Northwestern Notations.

Minneapolis, March 1.—The mayor of Centralia, Wash., has refused to sign the lease of the electric-light plant to W. W. Canon. The council voted it by 5 to 1. It is understood that public sentiment is now against the measure.

Alderman Erickson of Sioux City, Ia., wants the matter of a municipal electric-light plant brought before the voters of the city.

The project of an independent electric company for Waterloo, Ia., received an impetus in the offer of a Cedar Falls man to take $6,000 worth of stock. By the terms of his offer, Waterloo capital to the amount of $10,000 is to be interested.

Mandan, N. D., has granted a franchise to C. E. V. Draper for electric lighting, reserving the right to purchase the plant at any time.

The project for an electric railway between Sheboygan, Wis., and Sheboygan Falls has been revived, and there is a strong probability that it will be constructed and put in operation this summer. The line will be an extension of the Sheboygan electric line, and will be built by John M. Seaman.

The option recently taken on the street-railway system of Appleton, Wis., has been allowed to expire, and it is supposed the proposed extensions to Fond du Lac will now be dropped.

The Twin City Rapid Transit company has accepted the ordinance passed by the St. Paul Council for changing the Selby avenue cable into electric, and proposes to begin work as soon as the frost is out of the ground.

John A. Hartlip, manager of the electric-light plant at Lake Mills, Ia., contemplates making a proposition to the council of Northwood, Ia., for a plant.

The local paper of Elroy, Wis., urges an electric plant be put in, to be operated in connection with the water-works.

The car barns of the Menominee (Mich.) Electric Light, Railway and Power company were burned, destroying 12 cars, with a total loss of $25,000. The company will borrow cars from Marinette until an equipment can be purchased.

The village of Gaylord, Minn., will vote on March 8th on the matter of a municipal electric-light plant.

Electrical engineers of the Twin Cities held their annual banquet in St. Paul recently. Between 30 and 40 were in attendance, and speeches were made by Morgan Brooks of the Electrical Engineering company, Minneapolis; Prof. George D. Shepardson of the State University, and others.

The electric light company of Jefferson, Wis., has made a proposition to the people of the town to sell the plant to a stock company, on the valuation of a disinterested committee. The company further offers to take a portion of the stock in the new company or not, just as may be thought best.

H. M. Vaughn has resigned as manager of the Electric Light and Power company of Newton, Ia., and is succeeded by C. E. Groesbeck of Grand Rapids, Mich.

The special election at Sac City, Ia., on the matter of granting a franchise for electric lighting to the Sac City Electric company was overwhelming in favor of the lights.

W. E. Caldwell & Co. have been granted a franchise at Bussey, Ia., for electric lighting.

It is reported that an electric railway will be constructed from the new town of Ferrodale, Ill., which Thompson McCosh, a millionaire of Burlington, Ia., will found, to Muscatine, Ia., via Oquawka, Keithsburg and New Boston.

Arthur Peabody has been granted a franchise at Baldwin, Wis., for an electric-light plant.

The electric-light company will have the new water wheels at Fergus Falls, Minn., in operation soon.

The Lakeside Street Railway company of Duluth, Minn., has sued the Duluth Street Railway company for $12,416.52, alleged to be due on profits on the Lakeside line, and also demands an accounting. It charges that the company refuses to turn over the profits, which have been covered up by fictitious charges of expense.

M. Shaw & Co. sued Fitch Gilbert in Eau Claire, Wis., for $23,672, claimed to be due from the National Electric Manufacturing company, which went to the wall several years ago. The plaintiff charges that the defendant made false representations to plaintiff to secure credit for the sum in question, when plaintiff was doubtful of the solvency of the National Electric Manufacturing company. It is said other suits will follow.

George Fisher of Remington, Ind., has made a proposition to the council of Lake City, Ia., to establish an electric light plant.

The Canyon Ferry dam near Helena, Mont., is expected to be put in operation furnishing electric power for Montana's capital city.

The council of Benson, Minn., contemplates putting in an electric fire-alarm, with an electric bell in the home of each fireman.

The electric-light and water-works plant at Wadena, Minn., is about completed. When it is finished the plant will be one of the best in the state.

The proposed street railway for Calumet, Mich., will be pushed in the spring. An electric belt line, 30 miles long, may be built within a year or two, to connect all the mining towns in the county.

The Marinette and Menominee Electrical company has been organized at Marinette, Wis., to develop electrical power from Chappe Rapids in the Menominee River. It will furnish power for street railway and for a paper mill. The plant will cost $150,000.

Canadian Intelligence.

Ottawa, February 28.—One of the commercial sensations of the year at Montreal was created when it became known that hereafter the Montreal Street Railway company would not only pay its dividends quarterly, but would increase them to 2½ per cent. quarterly. The stock of this electric railway is now quoted at 243¼, being an increase, since the announcement of the quarterly dividends, of 7½ points.

An electric horn, invented by Mr. A. Trudeau of this city, has just been placed upon the market. It is intended to be used in scholastic institutions in the dormitories for waking pupils, or as a fire alarm, or for any purpose where a whistle might be utilized and where there is an electric current available. The horns can be placed in different parts of a building and all set tooting at once by turning on the current.

A contract has just been entered into between the Public Works Department of Canada and the Ottawa Electric company, covering the lighting of all government buildings in Ottawa by electricity. At present there are some two thousand electric lights in the Parliament buildings alone. These are operated from an electric-light station belonging to the government. This station will now be closed and the circuits will be connected with the system of the local company. The remainder of the Parliament buildings as well as the departmental and other public buildings are lighted by gas, for which electricity will be substituted. The Ottawa company has five electric-light stations in the city, four of them using water as a motive power. Much unfavorable criticism has been expressed at the action of the department in passing over Canadian firms to purchase American electric fire appliances for the government buildings, but as the department considers the Worthington pumps to be the best in the world, these only will be accepted.

A bill passed the Ontario Legislature at its recent session which is regarded as being somewhat of an innovation. It provides that the city of St. Thomas, Ont., shall guarantee the street-railway company's bonds to the sum of $50,000, to enable the company to "electrify" its street-railway system. In the event of the company failing to keep up its payments on the bonds the city is permitted to take over the road and operate it. Hon. Mr. Gibson, commissioner of crown lands, in referring to the bill, stated that the provision for municipal operation was something that had never been introduced into the Legislature before, but he believed that, in the modern view, such powers were proper ones to bestow upon the municipality.

The Colonial Lighting Syndicate is said to be en-

deavoring to secure control of electric-light, gas and street-railway systems in Ontario. A recent issue of the Belleville (Ont.) Intelligencer says: "The proprietor of this paper has been in regular communication for many months with a Toronto firm, acting in the syndicate's interest, and we are given to understand that if the negotiations go through it is the intention of the syndicate to extend the road to Tweed, using heavy rails that will enable the Canadian Pacific railway to haul their cars to and from that town, a contract for that purpose to be entered into with the railway company. We also understand that Sir William Van Horne has agreed to give a certain sum of money toward the enterprise. The object of the syndicate is to secure a number of similar enterprises in Canada, operating them under one system, which it is now doing in Ceylon, where the representative, now in Canada, has been for 12 years."

Application will be made to the Dominion Parliament for an act to incorporate the North Shore Electric Railway company to construct a railway on the north shore of the St. Lawrence, starting from Three Rivers, in the province of Quebec, and through the district of Three Rivers and other districts in the province.

The Canadian Pacific railway is credited with the intention of building a telegraph line to Dawson City in the spring. It will probably be extended from Quesnelle, where the lines now end.

The British American Light and Power company is applying to Parliament for power to construct and operate by electricity or other power tramways to Dawson City, Fort Selkirk and other points in the Yukon and Northern British Columbia; also to operate heating and lighting systems.

The Dechenes Electric Light company of Dechenes Mills, Que., is having plans prepared for the construction of dams at Dechenes Rapids, intended to furnish 3,000 horse power. A new power house will also be erected, the contract for which will be let at an early date.

An electric railway between Ottawa and Metcalf is being advocated. The distance is about 20 miles, and the country through which such a road would run is quite level, and would necessitate no great engineering feats to construct the road. One great drawback is the lack of water power.

Application will be made to the Dominion Parliament for an act to incorporate the North Shore a company to construct a railway by electricity or other power between London, Ont., and a point in or near the village of Lucan, and from Lucan to a point in or near Centralia, in the township of Stephen, in the county of Huron, to a point in or near Grand Bend on Lake Huron; also with power to construct and operate telegraph and telephone lines, to take and use water for generating power, and to transmit and dispose of the power derived therefrom; to build, acquire and operate steam and other vessels, and all necessary wharves and docks.

A. V. W.

PERSONAL.

Prof. R. B. Owens now holds the position of director of the reorganized Bureau of Electricity at the Trans-Mississippi and International Exposition at Omaha.

Among recent electrical visitors to Chicago were William H. Hornsberger of Aurora, Ill., T. H. Graham of Virden, Ill., John S. Maurer of Fostoria, O., and Frank De Ronde of New York.

Charles W. Bartlett, general manager of the Mutual Telephone company of Des Moines, Iowa, is in Chicago. Mr. Bartlett directs the operations of a co-operative independent telephone company, which is proving very successful. He reports that his men can hardly keep up with the work of placing instruments for new subscribers.

Dennis Doren, the general superintendent of construction for the Western Union Telegraph company, is dead. Mr. Doren was one of the ante-bellum telegraphers and was also a military telegrapher during the war, when he made a fine record. Mr. Doren was very well known in telegraphic circles and highly esteemed. He was 68 years of age.

Hugh M Matheson, who died recently, was interested in the house of Matheson & Co. since the foundation of the firm in 1848, and for some years had been its active head. He was chairman of the Rio Tinto company for many years, and during recent years helped to manage the Mountain Copper company of California and the Electrical Copper company in London One of his last ventures in connection with American mining was to acquire an interest in copper properties in the Pyramid district in the East Kootenay division of British Columbia.

ELECTRIC LIGHTING.

Charles Williamson of Stuttgart, Ark., has secured an exclusive 30-year franchise for electric-light and water works service in that place. He will install a small plant at once

George F. Lamb, who has won the contract for furnishing Albion, N. Y., with fifty 2,000 candle power arc lamps every night, moonlight schedule, until 1 a. m., at $62 per year, states that as soon as spring opens his company will commence the erection of a power house, set poles and string wires for the purpose of carrying out the contract. The stock in the present plant is owned by the heirs of the late Hon. E. K. Hart and the late William G. Swan and others residing in Albion, composing the company which first furnished Albion with electricity.

The newly organized People's Electric Light and Power company of Crestline, O., has a 10-year contract for operation in that town. It will erect a station and install a complete equipment. The Cornman company of Cleveland has the contract for the electrical apparatus.

The aldermanic committee on electric-light plant at Atlanta, Ga., has recommended that the City Council employ a competent engineer, appropriating not more than $1,000 to investigate and report on the cost of the city erecting and operating its own electric-lighting system.

A certificate of incorporation of the Westchester (N. Y.) Gas and Electric company, with a capital stock of $300,000, has been filed. The company is formed to carry on the manufacture of gas and electric light in the towns and villages of Rye, Port Chester, Mamaroneck, Larchmont, New Rochelle, Harrison and Scarsdale, N. Y., and Greenwich, Conn. James M. Pendleton of Westerly, R. I.; George V. Foster of New York; Arthur L. Chester of Westerly, R. I.; Wallace Hackett of Portsmouth, N. H.; Herbert T. Jennings of Mount Vernon, Paul Armitage of Bay Shore, N. Y., and Henry D. Donnelly of Brooklyn are the directors.

The new Parkersburg (W. Va.) Gas, Electric Light and Street Railway company is a consolidation of the old Parkersburg Gas company, the Parkersburg Electric Light company and the Parkersburg City and Suburban Street Railway company. The old gas and electric companies had been in existence for several years. The railway company had been recently organized, and had just begun the construction of a road. It contemplated covering only the streets of the city and the adjacent suburban villages, making a trackage of about eight miles. The new management expects to have the entire road completed and running by the first of June.

Electric headlights for locomotives are meeting with increasing favor. George Rommel, the master mechanic of the Wilmington and Northern railroad, writes to the Railway Age to give this testimony: "We have had them in use for the past six years, and they have been entirely satisfactory. They are not only the best headlights, but the current generated by the dynamo can be used for lighting trains. We have experimented with this for some time and have had our mail car No. 12 lit up for some time and have obtained excellent results. We have six 16 candle power incandescent lamps in this car. In our first experiments we put 14 lamps on a board and attached them to main wire, and they all lit up brilliantly, with no perceptible change in the headlight. We feel confident that we can attach twice that number, and will equip our trains with them as soon as we can get the necessary couplers. The electric headlight has come to stay."

ELECTRIC RAILWAYS.

The Chicago City Railway company has asked the City Council for permission to build 14 miles of new overhead trolley-car lines, mostly in Hyde Park.

An electric line 30 miles in length will soon be built by the Obion and Tiptonville Rapid Transit company, connecting Obion, Tenn., with Tiptonville. W. B. Southgate of Nashville has been engaged to locate the line.

Percival Steele of Chicago and others have secured a franchise to build an electric railroad in Vicksburg, Miss. At least four miles are to be completed during the present year and work is to be begun within the next five months.

A new electric railroad is to be constructed to connect Charleston, S. C., with Mt. Pleasant, Sullivan's Island and Long Island. The company will be known as the Charleston and Seashore Railroad company, and will have a capital of $400,000 and a like amount of bonded debt.

An effort is being made to amend the act governing the Washington and Marlboro Electric Railway company, so that it may be enabled to extend its lines into the District of Columbia, the work of extension to be completed within one year after the passage of the bill.

The Fairmont Electric Railway company has been chartered for the purpose of operating an electric street railway in Fairmont, W. Va., and through the counties of Marion, Monongalia and Harrison. The incorporators are John B. Crane, Charles E. Manley, A. Howard Fleming and others.

It is reported that the Portsmouth (Va.) Pig Point and Newport News Railroad company is about to commence work on its electric line between Portsmouth and Pig Point. A ferry will be used in connection with the road to Newport News. Henry Kirn and R. H. Norfleet are in charge of the construction.

The Cincinnati Street Railway company has closed a contract with the General Electric company amounting, it is said, to over $100,000. It covers the necessary electrical apparatus to enable the Cincinnati company to change over that portion of its system now driven by cable, the Walnut Hills line, to an electric system. The Boston elevated railway has also placed a contract with the same company for electrical apparatus amounting to the same sum.

The new Electric Light and Street Railway company of Parkersburg, W. Va., has purchased the Park City street railway for $20,000. All the old bonds have been taken up and paid for. The new company has surveyed and mapped out all its lines and will begin work on the electric system throughout the city and suburbs immediately.

All the street-railway property and franchises in Detroit are now, it is said, owned by the interests represented by Tom L. Johnson of Cleveland and Albert Pack of Detroit. These men have for some time been at the head of the Detroit Railway company and the Citizens' Street Railway company. On March 1st they filed articles of association of the Detroit, Fort Wayne and Belle Isle railway, the successor of the Fort Wayne and Belle Isle company, the purchase of which for $700,000 they have concluded. The new company has a capital stock of $1,200,000, which, it is asserted, represents the actual value of the property and franchise, the capitalization of the old company being far too small. The stockholders of all three companies are now practically the same.

A scheme or system of rapid transit for the city of Paris was adopted recently, after several years' study of the needs and cost of such an improvement. The project contemplates a number of connecting railroads, to be operated by electricity, and it is expected that a portion of the line will be in operation some time next year. There will be seven distinct routes, with a number of crossing or connecting lines, forming a network that should afford excellent facilities for intercommunication to various parts of the city. The total length will be 41 miles, of which 25 will be underground, seven in open cutting, and about the same on viaduct. The motor cars to be used will seat 44 passengers and weigh 20,000 pounds, exclusive of passengers. It is proposed to run trains of four cars, only one of them being a motor car (which will probably receive current for its operation from a third rail), and the other three of practically the same size and seating capacity, but weighing only 13,000 pounds. For the speed and frequency of the trains as proposed, it is calculated that about 25,000 horse power will be required. The estimated cost of road and equipment is to be $36,000,000.

TELEPHONE.

The Mountain Telephone company of Harlan, Ky., has been incorporated, with H. C. Clay as president; Prof. W. C. Clemens, secretary and treasurer, and John B. Hurst, general manager.

The Southern Bell Telephone company will make extensive improvements to its building and exchange in Birmingham, Ala., at an expenditure of possibly $20,000.

The Northwestern Telephone Manufacturing company of Milwaukee, Wis., says it is at present overrun with orders for telephonic apparatus, and has found it necessary to order additional machinery to enable it to cope with the orders now at hand.

POWER TRANSMISSION.

It is stated that a syndicate of New York capitalists has formed a scheme for obtaining control of the water power of the Housatonic River and using it to drive an electric plant two miles above Shelton, Conn., to furnish power to the factories and trolley roads of all of the cities and towns in the state west of the Connecticut River. It is understood that Standard Oil men are leaders in the enterprise. James C. De Long of New York, an agent of the company, has been in Waterbury in consultation with Superintendent Sewell of the Waterbury Traction company and with the heads of the principal factories in that city and in Bristol, Hartford, Meriden, New Britain and Berlin. A short distance above Shelton is the famous Housatonic dam. The river at this place is about 200 yards wide, and the dam has a height of 28 feet. From it leads a canal that furnishes water to a number of factories in Shelton.

A recently completed power transmission plant is that of the Delta (Pa.) Electric Power company, which transmits 450 horse power from Gartridge Falls on Muddy Creek to the town of Delta, York County, Pa., a distance of five miles. At the falls there is a dam 41 feet high and 120 feet wide, and the water is conducted to a stone power house, in which are installed a pair of turbines and a 350-kilowatt generator. Twenty-four inch McCormick turbines, made by the S. Morgan Smith company of York, Pa., give 560 horse power at 400 revolutions. The water power at the dam is estimated at 1,000 horse power at low water. The turbines are directly coupled to the generator, which is of the Stanley two-phase type and designed for an output of 5,000 volts pressure. The current is taken over a substantial aerial line of No. 4 wire to Delta, where there is a sub station with five step-down transformers. One transformer of 40 kilowatts reduces the

voltage to 1,000 for the Delta Electric Light company, and this is further reduced to 110 volts at points of consumption. Four transformers in the sub-station are for power purposes, and these reduce the potential to about 450 volts for the operation of Westinghouse two-phase motors. One motor drives the press of the Delta Herald and Times, and that paper has published a very good account of the plant.

ELECTRICAL SECURITIES.

The Edison Electric Illuminating company of New York reports gross earnings for January of $298,307, an increase of $58,008 as compared with the same month last year, and net $165,389, an increase of $28,845.

The Edison Electric Illuminating company of Brooklyn reports gross earnings for January of $89,381, an increase of $5,633, as compared with the same month of last year, and net $44,002, an increase of $1,605.

The annual report of the Columbus, O., Street Railway company shows a surplus of $4,293 in the year's business after paying $286,874 in operating expenses, $200,151 in fixed charges and $120,000 in dividends. The gross earnings were $605,921.

The shareholders of the Coney Island and Brooklyn Railroad company have voted to increase the capital stock of the company from $1,000,000 to $2,000,000. Negotiations are under way for the complete consolidation of the road with the Brooklyn City and Newtown railroad, hence the increase in the capital stock.

The last quarterly statement of the Metropolitan Street Railway company of New York city has been filed with the State Railroad Commission. It shows a net increase in earnings as compared with the corresponding quarter of the preceding year of $188,484. The report shows: Gross earnings, $2,383,458; operating expenses, $1,208,769; net from operation, $1,174,688; other income, $150,918; gross income, $1,325,607; fixed charges, $789,006; net income, $536,600. The net income for the same quarter in 1896 was $418,116. The general balance sheet shows cash on hand of $1,163,807, and a profit and loss (surplus) of $1,737,198. There was earned on the stock in the quarter 1.785 per cent., against 1.36 per cent. in 1896 and 1.19 per cent. in 1895.

MISCELLANEOUS.

Frank C. Perkins, 126 Erie County Bank building, Buffalo, N. Y., is one of the patentees of a new automatic electric switch and circuit breaker. He wishes to correspond with switch and cut-out manufacturers who can make the new device in thousand lots.

Sealed proposals are being invited until March 24. 1898, for electric lighting and power installation at Plum Island, N. Y. Specifications and blank forms of proposals can be obtained upon application to Major Smith S. Leach, United States engineer, New London, Conn.

The city administration has caused to be introduced in the City Council of Chicago an ordinance requiring a fee of $2 for every permit for electrical line construction—overhead or underground—in the city. The ordinance relates to the setting of poles, laying of conduits, stringing of wires and the like, and not to the wiring of buildings or the installation of plants. It is intended to recompense the city for the inspector's investigation. The ordinance was referred to the finance committee.

The naval appropriation bill in the House of Representatives contains the following items of interest to the electrical industry: An addition to the electric-light system at the Brooklyn navy yard, $15,000; steam generator for heating purposes and electric plant at the League Island navy yard, $5,500; for improvement of the electric plant at the Washington navy yard, $10,000; for enlargement of electric plant and concentration of steam at the Norfolk navy yard, $20,000, extension of the electric-light system at the Mare Island navy yard, $15,000; for electric plant for Puget Sound naval station, $9,800; for building a conduit for underground service for wires, etc, and for other purposes, at the naval observatory, $15,000. The bill carries a total appropriation of $31,918,626 55.

TRADE NEWS.

The Cabinet Manufacturing company, formerly of Ashtabula, O., is now installed in its new and modern plant at Steubenville, O. Telephone woodwork is the specialty of this company.

The eastern friends of Mr. John R. Cole of San Francisco, general sales agent for the Pacific Coast for the New York Insulated Wire company, enjoyed a renewal of his acquaintance last week.

Manager of Sales B. C. Kenyon of the New York office of the Diehl Manufacturing company, Elizabethport, N. J., paid a visit to Chicago last week. Mr. Kenyon has been on an extensive trip clear through to the Pacific Coast, and is now on his way back to New York. He is greatly pleased with the sale of Diehl fans and lamps. In fact, he stated that he had secured, as he put it, "several Klondike orders," one of which was so large that it really astonished him.

The Stromberg-Carlson Telephone Manufacturing company of Chicago is reporting a steady, increasing demand for telephones for mines. The equipment for this purpose is protected against dampness by saturating the principal parts in a specially prepared compound.

A. A. Kent, manager of the Kent Electric Manufacturing company of Worcester, Mass., writes that his factory, with a stock of motors, was recently destroyed by fire. The company set to work energetically to make good its loss, and expects to be back where it was by next week.

A fine book is issued by the Cambria Iron company of Philadelphia, giving useful information, with full-size plates of steel girder rails for street-railway use. Data of other materials for track construction are also given, and the work should form a valuable and welcome addition to the engineer's library.

The Davis & Egan Machine Tool company of Cincinnati, O., has just received an order from its Copenhagen office for 11 machines, including lathes, milling machines, drill presses, screw machines, etc. It also has received an order for several lathes from St. Petersburg, Russia, and an order for three machines from Belgium.

Several new publications of the Western Electric company will interest the electric-light man. One is a well-executed bulletin of arc-lighting dynamos and others show the lamp parts of various types of arc lamps. The company also calls attention to its improved '98 desk fans, Tuerk alternating-current ceiling fans, Victor split insulators and swinging tree insulators.

Those engaged in telephone work who may be seeking a little reference book of general information can get a work of this character from the Farr Telephone and Construction Supply company of Chicago. The Farr company is prepared to furnish anything needed in the telephone and general construction line, and has by its promptness and general reliability earned an excellent reputation.

At a recent meeting of the stockholders of the Star Electric company of Binghamton, N. Y., the following-named directors were elected: George S. Beach, to hold office until first Tuesday in May, 1901, C. E. Beach (1900), H. W. Doughty, (1899), S. H. Chase (1898). At the adjourned annual meeting of the directors on February 16th, the following-named officers were elected: President, George S. Beach; secretary and general manager, C. E. Beach; treasurer, H. W. Doughty.

A. L. Ide & Sons, the engine-building firm of Springfield, Ill., issues the following self-explanatory notice: "The Hon. William J. Allen, judge of the Circuit Court of the United States at Springfield, Ill., handed down a decision in the case of Addie F. Ide et al., executors, against Chuse et al., on December 21st, sustaining the validity of the following patents: No. 308,498, for steam-engine governors, granted November 25, 1884, to Albert L. Ide; No. 321,726, for steam-engine cross-head lubricators, granted July 7, 1885, to Albert L. Ide; No. 396,209, for engine frames, granted January 15, 1889, to Albert L. Ide; No. 400,682, for lubricating device for steam engines, granted April 2, 1889, to Albert L. Ide. These patents cover the governor, engine frame, cross-head lubricator and self-oiling system which has become known to the public in connection with the Ideal engine. Manufacturers and users of engines embodying the features covered by these patents are notified that they will be held to account for infringement."

Visitors to the Chicago office of the Westinghouse Electric and Manufacturing company note a pleasing transformation in the offices in the New York Life building. The space has been divided into a larger number of offices, and the whole suite has been rearranged and handsomely decorated. Manager Coster and his energetic assistants are as active as their spick-and-span surroundings indicate. They report business as booming since the first of the year; in fact, last month was one of the most successful in the history of the office. A number of important contracts, some of them of exceptional interest, have been closed during this period. The Anglo-Swiss Condensed Milk company has ordered a large factory transmission plant for its establishment at Dixon, Ill. There will be two 120-kilowatt three-phase generators supplying 440-volt current at 7,200 alternations to 20 three-phase motors ranging in size from one to 20 horse power. These motors will be belted to shafting driving the machinery used in condensed-milk manufacture. The Glucose Sugar Refining company has signed a contract for two 120-kilowatt two-phase generators, to be installed in the Chicago factory of the company, to furnish current for lighting and motors. Another recent customer is the Western Cottage Organ company of Ottawa, Ill., which has placed its order for one 75-kilowatt two-phase generator and a 50 horse power motor of the same type. This plant will be water-driven and will include a four-mile transmission line between the power house and the factory. In direct-current apparatus the company's Chicago hustlers have been no less successful. A big plant has been sold to Deere & Co., the eminent firm of plowmakers of Moline, Ill. It comprises four shunt-wound, 500-volt, multipolar, 125 horse power motors and three motors of the same design but of 150 horse power each. The switchboard is included in the contract, but the current is supplied from the water-power plant at Moline. The United Alkali company of Bay City, Mich., has also placed an order for two direct-current generators to be direct-connected to Allis engines. These are multipolar machines of exceptional size and will be driven at 80 revolutions a minute. The current from them will be used for electrolytic work. Two direct-current generators of 225 kilowatts and 575 volts will be supplied to the Detroit, Ypsilanti and Ann Arbor Railway company; also two 125-kilowatt motor-driven boosters and 10 quadruple (four 50 horse power motors) car equipments. The generators in this plant are directly connected to Westinghouse engines and will operate at 250 revolutions.

BUSINESS.

The Berlin Iron Bridge company of East Berlin, Conn., is building a new boiler-house roof for the Coe Brass Manufacturing company at Ansonia, Conn.

On account of the great demand for engines for electric light and power purposes, the works of the Ball Engine company, Erie, Pa., builder of the Ball engine, have been operated night and day since September last.

An exceptionally interesting catalogue is that of Baker & Co. of Newark, N. J., gold, silver and platinum refiners. The book is principally devoted to data concerning platinum, which has many uses in electrical applications. Several valuable tables are given in the back of the book.

A booklet issued by the International Correspondence School of Scranton, Pa., gives endorsements of the steam engineering courses by 88 students. The school is prepared to give thorough and practical instruction wherever written or printed matter can be sent by mail.

"Shade Lamps" is the title of a dainty little catalogue just issued by the Electric Appliance company, covering its special lines of Espersen, Klemm and Dale electric portable and shade lamps. It is a valuable catalogue for any user or dealer in these goods, and will be sent on application.

The Mason Electric Equipment company of Chicago has just closed, through Manager E. R. Mason, a contract with C. E. Loss & Co. of Chicago for the six-mile extension of the Bluff City electric railway. This road runs from Waukegan, Ill., to Evanston. The entire overhead equipment was furnished by the Mason company.

J. Lang & Co. of 44 Michigan street, Chicago, manufacture both steam and electrical specialties, as their catalogue shows. They call attention to their special cast metal, which has a tested conductivity of 60 per cent. of pure, hard-drawn copper. They use this metal for the bases of their switches, for all lugs, connections, etc., in fact wherever carrying capacity is needed in castings.

The Ward Leonard Electric company has just issued a new price-list on circuit breakers, much less than the previous one, while the same discounts apply as before. The space occupied by apparatus on a switchboard is often a very important consideration. It is to be noted that the Ward Leonard company has designed its circuit breaker to occupy a minimum space without sacrificing material.

The Bristol and Plainville Tramway company is erecting near Plainville, Conn., a new substantial steel bridge, having a span of about 90 feet. The bridge has been designed with the view of being a permanent structure, well able to take care of the increasing and heavy traffic of the road. It has been furnished and is now being erected by the Berlin Iron Bridge company of East Berlin, Conn.

The Western Electric company has recently issued a bulletin descriptive of the Lakon transformer, which is made for long-distance transmission, for the ordinary 1,000 and 2,000-volt primary and 110 and 50-volt secondary, for three-wire system and for arc-light transmission. The transformers are oil-insulated and can be run either as dry transformers or oil-insulated transformers. The Laken transformers have no joints on the top or sides, the only joint being on the bottom, thus making the case thoroughly weatherproof without the use of cement or other material to fill up the cracks. The larger sizes are placed in either an open case for inside use or in weatherproof case for outside use.

The Pennsylvania Line has placed in service on its night trains between Chicago and Cincinnati Pullman compartment cars, thus improving its already excellent accommodations between Chicago and the Ohio River. For space apply to ticket agents Pennsylvania Lines, No. 248 Clark street, Auditorium

Hotel, No. 221 Michigan avenue, or Union Passenger Station, Canal and Adams streets, Chicago.

M. C. Henry & Co. of New York city are enlarging their plant and making some extensive improvements. Their new steel stone shed, which is about 50 feet wide, is to be extended about 70 feet in length. The metal work, which consists of the steel framework of the building, the covering upon the roof and sides, and the metal runway for traveling crane, is being furnished and erected by the Berlin Iron Bridge company of East Berlin, Conn.

The Western Electric company is at present recommending an electric spud as a serviceable construction tool. This spud is in the nature of a digging bar provided at one end with a braid of open-hearth crucible mining steel and on the upper end with an iron tamper, thus combining a digging bar and a tamping bar in one tool. The length of the spud is nine feet, and it digs three times as fast as an ordinary bar and is only half as heavy.

The complete wiring system, as established and standardized by the Interior Conduit and Installation company, will be installed exclusively in the new Park Row building, New York, said to be the largest office building in the world. Some 250,000 feet of interior conduit will be used in the installation, which will be made by the New York Electric Equipment company. The Sprague high-speed vertical electric elevators will also be used in this building.

The business of the Mansfield Tempered Copper company of Mansfield, O., has increased so rapidly during the last year that it has been found necessary to build an addition that will more than triple the capacity of the works. Among other large orders recently received for this company's tempered commutator bars have been several from England, where they are finding a ready sale. This company has now one of the best equipped factories in the country, with every facility for turning out large orders on short notice.

The Mica Insulator company of 218 Water street, New York, 117-119 Lake street, Chicago, and 12 Camomile street, London, reports a heavy increase in the volume of business. Many of the large manufacturers are using its Micanite segments exclusively in the construction of generators and motors. The company has made many valuable improvements in its well-known insulation, Micanite, and is turning out a fine commutator segment. It will be pleased to send a set of segments for any of the smaller machines, as samples, to electrical manufacturers or repair concerns who may make application. Its M-I-C friction tape and Empire cloth are meeting with a large sale. They are used for the winding of fields and armature coils.

Announcement is made of the following changes in management of the Wagner Electric Manufacturing company: S. B. Pike, secretary of the Missouri Edison Electric company, assumed general management of the business. He will be seconded by W. O. Layman as assistant general manager, who will take personal direction of the details of the business in all matters of an executive nature. Eugene H. Abadie will devote his entire time and efforts to the sale of the company's products, and Ferd Schwedtmann, who has so ably conducted the design and manufacture since the company's inception in 1892, will continue as superintendent of the manufacturing department. H. A. Wagner, being one of the board of directors, will continue his active interest in an advisory capacity.

The new catalogue of the Safety Insulated Wire and Cable company of 225 West Twenty-eighth street, New York, is a fine piece of advertising literature. It is evident the intention of the Safety company was to depart from wire-catalogue traditions, and create something that was unique and pleasing as well as instructive. That the company has succeeded in so doing will be the opinion of everyone who receives a copy of this excellent book. As it will doubtless be widely distributed, a description in detail is unnecessary. The back cover, however, is so unusual that it deserves special mention. It is a photograph in half-tone of a reel of Safety wire, showing reel, wire and shipping tag. The effect is very realistic. The half-tone cuts of wire and buildings throughout this book are of the first order.

Although a large number of series candelabra lamps is still in use a growing tendency exists to employ these lamps in multiple on ordinary circuits, with the result that the wiring of fixtures is much simplified, and the renewal of burned-out lamps rendered a much easier task. A full line of multiple candelabara lamps as well as series lamps is now made by the Edison Decorative and Miniature Lamp Department, which has just issued a handsomely illustrated catalogue in which all the styles of series and multiple candelabra lamps, multiple sign lamps, series decorative lamps, and lamps for special uses, such as bicycle, telephone, dental, surgical lamps and many others, are described. The department has also illustrated in this little work a complete line of receptacles and sockets for candelabra and miniature lamps. The catalogue is of interest not only to all central-station managers and dealers, but also to general customers, whether experimenter, physician or others using or likely to use lamps of this character. The catalogue may be obtained from the Edison Decorative and Miniature Lamp Department, General Electric company, Harrison, N. J.

ILLUSTRATED ELECTRICAL PATENT RECORD.

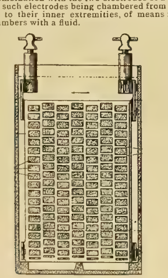
Issued February 22, 1898

599,315. Secondary Battery. Walter A. Crowdus, Chicago, Ill. Application filed January 25, 1897.

The process of forming the negative elements of spongy lead for use in secondary batteries consists in immersing plates coated with lead oxide in a solution of sulphate of zinc and sulphuric acid, and then passing a current through the solution and to the plates.

599,316. Electric Igniter for Gas Engines. Fitz E. Culver, Chicago, Ill. Application filed February 15, 1897.

The combination with the two electrodes of a gas-engine sparker, such electrodes being chambered from their outer portions to their inner extremities, of means for serving such chambers with a fluid.



NO. 599,315.

599,322. Individual Telephone Call. Thomas C. Drake, Malta, Ohio. Application filed July 2, 1894.

A selecting system is arranged to have each subscriber call any other subscriber without the intervention of the central office, comprising the combination of a line, a series of selecting devices thereon, step by step mechanism for operating the same, restoring mechanism for restoring the step-by-step mechanism to a position of unison, means operated by a current of given strength to operate the step by step mechanism, and means operated by a current of greater strength to operate the restoring mechanism.

599,344. Electric-railway System. John M. Murphy, Torrington, Conn. Application filed September 24, 1897.

An electric magnetic switch mechanism comprises a magnet having independent inner and outer windings, the outer winding having a lead connected with the sectional conductor, the inner winding having a lead connected with such conductor and having a switch in such inner winding lead, the yielding contacts connected respectively with the feeder wire and the outer winding of the magnet, and the plunger having a bridge piece to engage the contacts, and having means for breaking the switch in the inner winding lead.

599,346. Electric Wire-holding Appliance. Hugh A. McCoy, [illegible]. Application filed September [illegible].

A wire holding device is described, consisting of fingers pivoted to each other, provided with means for securing the same to a support and with means for holding the line wire consisting of openings [illegible] jaws in the fingers, the fingers being held open by a spring and adapted to be depressed by the weight of the line wire and to grip the same.

599,351. Electric Resistance Conductor. Henry G. O'Neill, Brookline, Mass. Application filed January 4, 1897.

A resistance conductor for converting electrical energy into heat energy, consisting of an oxide compound cast in the form of a rod or filament, having metallic terminal connections attached to each end thereof.

599,352. Electric Resistance Conductor. Henry G. O'Neill, Brookline, and Horace B. Gale, Boston, Mass. Application filed January 4, 1897.

In an electric conducting device there is the combination with a non-conductive support of a layer or film of conductive oxide applied to the support while in a fused state.

599,354. Electric Igniter for Explosive Engines. Hubert F. Probert, Chicago, Ill. Application filed April 8, 1897.

A rocker shaft moves one electrode against the other and causes the necessary spark.

599,393. Trolley for Electric Railways. Edward K. Landis, Philadelphia, Pa. Application filed March 5, 1897.

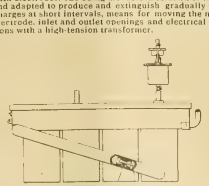
The current-collector is adapted to engage a conducting wire with a pivoted device having a wing on each side of the current-collector, each wing extending backwardly from its pivotal attachment to a point adjacent to the extremity of the current-collector, thence backwardly and obliquely, and thence forwardly toward its free end.

599,405. Electric Battery. Charles P. Shrewsbury, London, and John L. Dobell, Modbury, England. Application filed December 24, 1895.

This electric generator consists of a metallic cell containing an electrolyte, a chamber therein, a pipe leading from the chamber into the electrolyte, and suitable means for heating the metallic cell and keeping the electrolyte in a fused state.

599,455. Apparatus for Producing Ozone. Marius Otto, Paris, France. Application filed June 15, 1897.

The apparatus described comprises a shell or casing with electrodes, one being movable in relation to the other and adapted to produce and extinguish gradually the discharges at short intervals, means for moving the movable electrode, inlet and outlet openings and electrical connections with a high-tension transformer.



NO. 599,405.

599,480. Electric Arc Lamp. Orville B. Skinner and George M. Bacon, Cleveland, Ohio. Application filed August 27, 1897.

Provision is made in an arc lamp for an electro magnet horizontally disposed, and having poles with inclined faces, an armature outside the coil and parallel therewith, having inclined faces corresponding to those of the magnet poles, a carbon-holder depending from the armature, a spring retaining the carbon in the holder, a stop limiting the play of the armature and a trip adapted to release the spring.

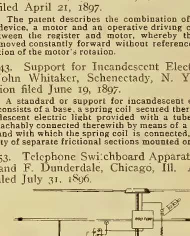
599,508. Driving Gear for Electric Meters. George A. Le Fevre, New York, N. Y. Application filed April 21, 1897.

The patent describes the combination of a registering device, a motor and an operative driving connection between the register and motor, whereby the register is moved constantly forward without reference to the direction of the motor's rotation.

599,543. Support for Incandescent Electric Lights. John Whitaker, Schenectady, N. Y. Application filed June 19, 1897.

A standard or support for incandescent electric lights consists of a base, a spring coil secured thereto, an incandescent electric light provided with a tube which is detachably connected therewith by means of a screw thread, and with which the spring coil is connected, and a plurality of separate frictional sections mounted on the coil.

599,553. Telephone Switchboard Apparatus. Cleaveland F. Dunderdale, Chicago, Ill. Application filed July 31, 1896.



NO. 599,344.

This switchboard comprises a hinged lever connected with the subscriber's line and constituting a line terminal which has a movement in more than one direction, and terminals for auxiliary circuits adjacent to the lever, together with a spring normally holding the lever in a position against one of the terminals.

599,560. Paper-perforating Machine. Frederick W. Hedgeland, Chicago, Ill. Application filed September 17, 1897.

There is the combination in a paper-perforating machine of a series of punches having toggles, a cam operating all the punches, a lifter for raising the punches after operation, a magnet for each punch having its armature connected to the toggle thereof, and a spring for each punch acting contrary to the magnet.

599,604. Electric-Railway System. James D. Gibbs, Chicago, Ill. Application filed March 14, 1896.

The system comprises a line conductor, a series of contact rails arranged in insulated sections and adapted to be enlivened when forced in contact with the line conductor, such rails overlapping at their ends, and a trolley having two contact wheels, each provided with a double tread.

599,635. Electric Arc Lamp. Henry J. Sage, Rochester, Pa. Application filed March 19, 1897.

In combination with an arc lamp provided with a carbon socket supported by rods from the base of the lamp and a threaded lower extension there is an inclosing casing below the base provided with clips embracing the rods, a globe, and a globe-holder screwed upon the threaded extension.

599,654. Fire-alarm Box. John H. Hayes, Appleton, Wis., and Charles Fisher, Chicago, Ill. Application filed January 21, 1897.

Features of the combination are an electrical circuit, a switchboard, electrical conductors leading from different contacts of the switchboard, a switch-lever pivoted to the board, an arm connected to the switch-lever and a starting lever for actuating the switch-operating arm.

Western Electrician.
EVERY SATURDAY.
Vol. XXII. CHICAGO, MARCH 12, 1898. No. 11

Auxiliary Cars in Storage-battery Traction.

Although the Western Electrician has described in detail the Englewood and Chicago storage-battery road and the efficiency tests made on the plant (Western Electrician, August 7, 1897, and February 5, 1898), it is believed that a brief description of the auxiliary car equipment recently put into service, with the accompanying pictures, will be of interest to those who are following the development of this departure in electric railroading.

The road is now owned by the Chicago Electric Traction company, with E. R. Gilbert as general manager and A. E. Davies as superintendent. It has been operated successfully during a trying winter, the only interruption being of a few hours' duration during the great storm which did so much damage in the West during the latter part of January. The line is 13 miles long and extends through thinly settled suburbs. It is double-tracked for all but a distance of 2½ miles at the Blue Island end, so that the task of keeping it free from snow was

no easy one. The snow-fighting apparatus is illustrated by the pictures on this page.

The snow plow is similar to those used on trolley roads, the difference being that it is equipped with storage batteries and has no outside wiring connections. It is 31 feet long, over all, and the length inside the car is 20 feet. The outfit weighs 20 tons, batteries included, and is mounted on a Brill truck with 425-pound, single plate wheels and four-inch axles. There are two batteries in the car, one tray above the other, and two 50 horse power Walker motors, one mounted on each axle, drive the plow. Each battery consists of 72 cells with a combined capacity of 200 ampere-hours. Each battery supplies current to one motor through spring contacts and insulated leads, the connection being made in a manner corresponding to that on the regular passenger cars. The method of sustaining the battery trays and of placing them in position is the same as in the ordinary cars. There is a controller at each end of the car and apparatus for raising and lowering the plow blades. A coal stove keeps the interior of the car at a comfortable temperature. The crew consists of two men—a motorman and a man who manipulates the plow blades—and the car has a mileage record, with one charge, of 24 miles through snow averaging nearly two feet in depth.

After the bulk of the snow is pushed from the track by the plow, the sweeper comes along and completes the operation with its rotary brushes. The sweeper employed is large and heavy, weighing 30 tons, and was built by the McGuire Manufacturing company. It is 33 feet long over all, the inside length being 28 feet. It is mounted on a truck having 4½-inch steel axles and 525-pound, double plate, 33 inch Griffin wheels. It has three batteries arranged in a vertical tier in the center of the car, and three motors, each of 50 horse power, connected in the usual manner. Two of the motors are mounted on the axles of the truck for driving the sweeper, and one is suspended on a horizontal shaft extending the length of the car and geared at each end to vertical shafts which in turn drive the revolving brushes. These brushes are 30 inches in diameter and are arranged to be raised or lowered at will, the bevel pinion on the vertical shafts being attached in a keyway of sufficient length to permit the desired change of position. The batteries are of the same size as on the snow plow, which, indeed, is the standard for all the cars. A clutch at each end of the horizontal shaft permits the coupling of either brush to the driving motor. The car is reversible in motion, and of course only the head brush is used. Ordinarily, in sweepers of this description the connection between motor and the revolving brushes is by means of sprocket wheels and chain, but the direct gearing is found to be better, as it gives sufficient flexibility with no lost motion and no danger of chain breakage. The motors are four-pole, iron-clad machines, wound for 140 volts. Four controllers are used, two at each end of the sweeper. One controller of each set regulates the car-propelling motors and one the brush-driving machine. The crew consists of a motorman and a man to operate the brushes. The car has been in use since December and has given satisfactory service. Its record, on one charge, is 18 miles. In summer the sweeper will be used to clear the tracks of dust and dirt.

An interesting example of the work done by the snow plow and sweeper is shown by the picture on the next page. The photograph was taken on January 29th and represents a cutting on Vincennes road, near One-hundred-and-twenty-third street, where some of the snowdrifts were four feet deep.

AUXILIARY CARS IN STORAGE BATTERY TRACTION.—SNOW PLOW AND SWEEPER.

For special occasions the company provides the handsome car Virginia, which is illustrated on pages 152 and 153. This is a double-vestibuled car 34 feet long 7.7 feet inside measurement, mounted on a Dupont truck equipped with one 50 horse power motor and one battery. The exterior is finished in dark olive-green, with gold trimmings, and the interior woodwork is of mahogany. An olive-green carpet, plate-glass windows, a ceiling tinted dark blue, comfortable chairs and tasteful electric-light fixtures give a rich and quiet effect to the interior, which is lighted by 24 incandescent lamps and heated by an oil stove. As there are four cemeteries on the line of the Englewood and Chicago road, this car is used as a funeral car as well as for pleasure parties. When used for a funeral the casket is placed inside the car through one of the end doors provided in each vestibule. The doors for passengers are at the sides of the vestibules. The interior of the car is arranged so that it can be divided into three sections by the heavy portieres shown in the interior view. One of these compartments can be reserved for the casket, but often the curtains are drawn back and the casket is deposited in the center of the car, with the mourners seated about it. This car was built by the St. Louis Car company.

Pan-American Exposition Deferred.

Buffalonians have abandoned the idea of holding a Pan-American exposition near that city in 1899, owing to the lack of financial support of the scheme. It will be remembered that Captain John M. Brinker, president of the Niagara Falls and Lewiston railroad, is president of the Pan-American Exposition company, and that Hon. W. Caryl Ely, president of the Buffalo and Niagara Falls electric road, was selected as director-general of the project. The status of the scheme is recited in the following official statement: "While the progress made in the financial arrangements for the Pan-American Exposition has been of a very satisfactory character and the interest manifested by the citizens of the various communities on the Niagara frontier has been most encouraging, the immediate development of the project has been arrested by the unsettled condition of the public mind because of the Spanish-Cuban complications and the consequent apprehension of war. On account of this condition of public affairs it is believed by those best able to judge that at the present time it would be practically impossible to secure from Congress that recognition for the exposition which is considered eminently desirable to insure its success. It is not improbable, however, that the condition of material affairs may before long assume a more pacific phase. If this proves to be the case, the question then confronted will be: Will there be sufficient time left in which to carry out the exposition in comprehensive and effective manner upon the lines hitherto contemplated? Possibly the answer may be in the negative, but even then it by no means follows that the project will have lost its vitality. A postponement of the time of holding the exposition for a year or even until 1901 may be found expedient. Those originally interested in the enterprise will not definitely abandon it until every means of carrying it to a successful issue has been exhausted."

Liberal Appropriation for Electrical Extension in Chicago.

In the general appropriation bill presented this week to the aldermen of Chicago the new Department of Electricity fared better than any other, asking for $230,804.96 and securing $250,255. This includes an appropriation for the extension and reorganization of the fire-alarm telegraph system, $120,000 for the extension of the municipal electric-lighting plant, $30,000 for maintenance, $15,755 for salaries and $12,200 for the electrical inspection department.

George A. Holderness and W. J. McDiarmid contemplate establishing a telephone system in Fayetteville, N. C.

Practice of Theory.[1]

By J. C. McMynn.

The subject of this short paper reminds me of a trolley car, for the reason that it can be turned either way and run equally well. Whether the subject should be "Practice of Theory" or "Theory of Practice," I must leave for your judgment.

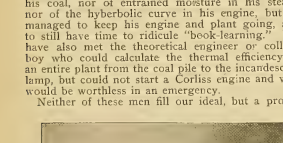
In the development of electrical machinery, together with the necessary steam auxiliaries, theory and practice have been the complements of each other, and neither could have reached the present stage of perfection without the assistance of the other.

Theory is much more progressive, and, as a usual thing, precedes practice, for practice paves the way and lays the track and makes it possible for the practical man to become a factor in the engineering profession.

The object of this paper is neither to practice nor decry theory or practice, but to simply recall to your minds the close relations existing between the theoretical man and the practical engineer; to a certain extent we are all theorists, for we have our own original ideas and fancies, and oftentimes the engineer who prides himself on being a practical man is the most theoretical.

However, it is with regret that I notice that the old-fashioned engine driver is fast disappearing. How he could sneer at and deride "book-learning" and "book-foolishness!" But he deserves our respect and admiration for the success he attained, and the work which he expended happily but unnecessarily. He knew nothing of the B. T. U. in his coal, nor of entrained moisture in his steam, nor of the hyberbolic curve in his engine, but he managed to keep his engine and plant going, and to still have time to ridicule "book-learning." We have also met the theoretical engineer or college boy who could calculate the thermal efficiency of an entire plant from the coal pile to the incandescent lamp, but could not start a Corliss engine and who would be worthless in an emergency.

Neither of these men fill our ideal, but a proper



AUXILIARY CARS IN STORAGE-BATTERY TRACTION.—A SAMPLE OF THE SNOW PLOW'S WORK.

combination of the two will give us an able, earnest, thoughtful and cautious engineer. Engineering colleges are to-day turning out, year after year, educated engineers who are exerting a strong influence on the profession, which is resulting in a strong union of practice and theory, the outcome of which must necessarily be engineers of a high standard, with broader and deeper foundations of learning and experience.

In my idea the application of theory to practical work is of the utmost importance to every owner of steam and electrical machinery. In construction work as well as in operation it is most valuable. To be sure, an engineer can consult a text or handbook and can there find out that masonry will sustain certain loads or that a girder of given dimensions will support a certain weight, but if he is unable to understand "the how" and "the why" he is much more liable to make an error.

To a certain extent the manufacturer represents the practical side of engineering, while the inventor and consulting engineer represent the theoretical side; yet frequently the manufacturer sees the advantage of practicing theory, and in such cases we see experimental laboratories established in large plants and original research carried on under the supervision of the most competent theorists.

I firmly believe, after mature observation, that the educated engineer who can master practice as well as theory is the one who will rise above his competitors in the future. Yet, do not understand that by "educated" I mean necessarily a college graduate. A man who can master the laws of mechanics, and can conquer mathematics by his own exertions, is deserving of more credit than one who was sent to college and learned simply because it was pounded into him.

Nearly every modern machine is an example of practical application of mechanics and design to theoretical ideas or discoveries, which thus become mechanical laws. Men knew that the electric current would some day become of commercial value, and long before the perfected dynamo appeared the laws governing the generation of the current were known.

A recent invention is a good example. For years we have known that a boiler-feed pump was doing much more work than was necessary, for if water were pumped into a closed tank above the water level and then the tank were opened into the boiler, the water would run into the boiler by gravity; the pump would be pumping against a 20-foot head instead of perhaps a 200-foot head. The recent invention consists of forcing the water to a level above the boiler, and then shutting valves and utilizing gravity. The saving made is about 85 per cent. of the steam formerly used by the pump. I simply mention this as a good example of the "Practice of Theory."

In a certain way, theory is the foundation and practice the structure of an engineer's attainments. The deeper and more substantial the foundation, the higher and more imposing can be the superstructure; the more substantial the foundation, the more resistance will the structure have to the winds of adversity and the more dangerous gusts of flattery and adulation.

A Survey of the Possibilities of Electric Heating and Cooking.[1]

By W. P. Adams.

Heating appliances do absorb what appears to be a large amount of electricity, and many electricians, especially those more closely connected with electric lighting, are surprised at the large amount of current which is necessary for cooking purposes, and mentally compare what might be done with the same current if devoted to the production of electric light.

As it is in the direction of electric cooking that I anticipate the largest development in the near future, I shall confine myself at first to a consideration of this subject.

In a kitchen suitable for supplying the needs of a family of from 8 to 10 persons the following apparatus would be necessary: Oven, absorbing 2,500 watts when heating up for about 15 minutes, and on the average about 1,200 watts afterward. Breakfast cooker, wound for two circuits, each absorbing 600 watts. Two grillers, each wound for 500 watts. Two frying pans, also wound for 500 watts, and several hot plates for warming ordinary saucepans, or in place of these several self-contained electric saucepans. These plates or saucepans would probably absorb 1,500 watts together. The household supplied from such a kitchen would probably have a maximum demand for not more than 2,500 watts for lighting purposes. The total watts which could be absorbed by the cooking apparatus is 7,200. It must, however, be borne in mind that these various appliances are used at different times, and never all together.

We shall now consider the difficulties in the way of the adoption of electric cooking. First and foremost is the question of the cost of current. This is all-important. In addition to this the first outlay cannot be overlooked, owing to the rather high cost of the apparatus.

The largest field for the development of electric cooking is undoubtedly in private houses supplied from central stations, and if there is to be any large extension in this direction the central stations must be prepared to supply current at a considerably reduced price than is now charged for lighting. It is generally recognized that electric cooking will eventually prove to be the means of solving the much-vexed question of securing a day load for central stations; and, in view of this fact, many of the central stations offer special terms for supplying electric currents for heating. A number of the central-station engineers are, however, still doubtful as to the advantage of combining cooking and heating, partly owing to the question of the load overlapping the lighting load. This question I shall touch on later, but I would venture to point out that, if the demand is spread over a sufficient number of hours, electric heating is worthy of consideration on a par with from electric lighting, and it would therefore pay to put down extra plant to meet the additional demand. In fact, I do not think the day is far removed when the demand for current for electric heating will vastly exceed that for lighting purposes. I submit that the solution of the question lies mainly in the hands of the present suppliers of electricity. If they are prepared to adopt a liberal policy of supplying electricity for heating purposes, perhaps at little more than the actual bare cost, they will very soon find that the improved conditions under which they run their plant will begin to repay them handsomely.

The Wright system of charging for electricity appears to be securing considerable support amongst central-station engineers, and the maximum-demand system seems to have been receiving even greater favor. With both of these systems I can foresee a double connection with the supply of electricity for heating purposes.

Under the Wright system it is conceivable that the demand meter may run up to a most unusual height, through the inconsiderate switching on of a number of the heating appliances together, the indicator, therefore, furnishing quite an abnormal record upon which the charges are to be based. Again, with the maximum-demand system, if the charges are to be made upon the usual understanding, that the whole apparatus is to be run for an hour at the maximum charge before any reduction is made, the charge cannot come down to anything like a reasonable figure. It is, of course, obvious that the whole of the appliances will not be in use together, and I think this point is worthy of close consideration.

In a certain kitchen it was found that the various cooking appliances were in use for from five to seven hours a day, during which time the highest point reached was 1.5 kilowatts. The average consumption during the day was from eight units. It will thus be seen that if generating plant to the capacity of two kilowatts was installed for supplying these cooking appliances, it would have an earning capacity of about 1,400 units per kilowatt installed per annum.

I find that the number of units sold per annum per kilowatt of plant installed varies considerably among the different stations in country towns where the load is almost exclusively a lighting one and the supply is very small during the daytime. About 400 or 500 units represent the work done during a year by one kilowatt of plant installed. In the larger towns, where there is probably a small day supply for power as well as one for lighting in dark offices and basements, the demand is larger. In Brighton, 840; Edinburg, 640; Glasgow, 696; Manchester, 700. It will be seen that Brighton, which might also be termed a country town, as there are no factories there to absorb power in the day, shows the best results of those named. This, I think, is traceable to the moderate nature of the charge for current.

As a load for summer time, cooking should prove invaluable to supply stations, and the question of overlapping during this period does not arise.

AUXILIARY CARS IN STORAGE BATTERY TRACTION.—INTERIOR OF SPECIAL CAR VIRGINIA.

In winter, however, the conditions will be different. A certain amount of overlapping will occur owing to the prevailing fashion of late dinners, but I submit that the load for electric heating is likely to be of sufficient importance to warrant putting down additional plant to meet this.

Much, of course, depends upon the acuteness of the peak as to how this question is to be met. If it can be arranged, it will be desirable to utilize for heating during the day the plant installed for lighting purposes, but if the demand for heating grows to such an extent as to greatly surpass the lighting load, the question becomes of less importance. It is not, perhaps, within my province at this moment to suggest how this difficulty is to be met, but with some stations in this country the question does not arise at the present time, as ample plant has been installed to meet the lighting requirements and still leave a balance in hand to allow for the overlapping. A number of stations appear to be provided with twice the amount of plant required to meet the maximum demand. Of course, some portion of this is reserve plant, but there still remains a good balance in hand to meet this contingency.

I am inclined to think that a secondary battery would prove of great value in meeting the peak difficulty, as there are several depressions on the day-load curve which could be filled up if the generating plant were employed during these times of light load for charging the accumulators. How far it is possible to economically utilize accumulators for this purpose in alternating supply stations is an open question.

While considering the charges made by the various supply companies it is noticeable that several have adopted the enlightened policy of charging for power and heating purposes a price which is actually less than the total works' cost. Putting on one side for one moment the question of overlapping,

---

1. Read before the Northwestern Electrical Association, at Milwaukee, January 20, 1898.

1. Abstract of paper read before the Northern Society of Electrical Engineers, England.

it is obvious that this is a right policy to adopt, as, assuming that the plant used for lighting is employed for supplying heating appliances, the charge for rent, management, etc., will remain practically the same.

I have the misfortune to be situated in a district served by the City of London company, which company holds a monopoly and takes advantage of this to maintain a charge which is worthy of the very early days of electric supply. Although their works' cost compares anything but favorably with other large towns, having in many cases a much smaller output, I think you will agree with me that the charge of 8d. is somewhat extravagant, and I may say that such a charge absolutely prohibits any demand for current for power and heating purposes. It is true that a rebate is made if more than a stated quantity of electricity is used, but this is fixed so that it is of little value in the way of reducing the price.

It seems almost incredible that, in these enlightened days, the foremost city in the world should be one of the worst supplied in the matter of electricity.

I have so far made no comparison between the cost of cooking by electricity and that by other means. I shall not deal with this question much in detail, as I think it more practical at the present time if a general idea is given as to what the actual consumption of electricity will be, for the cost by other means varies largely under different circumstances. I have, however, some figures to hand obtained in a kitchen where both gas and electricity could be used at will. The household was a small one, consisting of about five persons, and the consumption of electricity was approximately 30 units per week when cooking was done solely by this agency. When gas was employed exclusively, 1,200 cubic feet of gas were used during a week. The cost, then, of electricity at 2d. per unit is 5s. a week, and of the equivalent amount of gas at 3s. per 1,000 cubic feet is 3s. 9d.

The figures of consumption which I have given above are the most complete at my disposal, and this is my reason for bringing them before your notice, but I have other results to hand which indicate that the consumption of current may be reduced below the figures given when the appliances are used intelligently and with care. For small installations such as we have considered one may assume roughly that a unit per head per diem will suffice for all cooking purposes. These figures will naturally be reduced in larger establishments, and experience seems to point to about [illegible] unit as a sufficient allowance in kitchens where more than 40 or 50 persons have to be provided for. The best results will be obtained where there is a hot-water supply. Many of you are probably aware that heating water by electricity is a most uneconomical proceeding, at any rate at the present prices, and where an establishment is sufficiently large it is always recommended that a [illegible] combustion stove is fitted to supply all the hot water for the household. In many houses such a stove is already fitted.

There is one direction in which one might anticipate a large development of electric cooking, and that is in flats. If architects will arrange for a general hot-water supply for the whole building, as I believe is now done in many cases, electric cooking presents so many advantages that an important movement in this direction should take place when the supply companies are convinced of the advantage of charging such prices as will be generally acceptable. I think I have said sufficient to indicate that even with electricity at 2d. per unit electric cooking is not extravagantly expensive, and if its other great advantages are taken into consideration, particularly the economical results from the protection of the cooking, it ought to be received with prompt favor.

I am hoping that before long those responsible for electricity supply will begin to make a definite move in the development of electric heating and cooking. It is not sufficient to merely reduce the price of electricity to a reasonable figure, as many of the corporations have already done, but steps should be taken to induce people to become users of electricity for other purposes than lighting. The hire system, which the gas companies are much in favor of, should be adopted where possible. One of the difficulties which has been met with in the attempt to develop electric heating is the high first cost of the apparatus. This is largely owing to the comparatively small output of heating apparatus at the present time, and is also owing in no small degree to the many different voltages which the goods have to be made up for. You will probably be surprised to learn that there are no less than 14 different voltages in general use at the present time, and you will quite appreciate that this does not tend toward the cheapening of the appliances.

I have little doubt, if supply companies are prepared to give this matter their careful attention, that mutually satisfactory arrangements might be come to between themselves and manufacturing firms so as to meet these difficulties.

I have now to consider the practicability of using cooking and heating plant in connection with plant installed for lighting residences and factories.

In very few well-arranged and properly managed private installations does the cost exceed 4d. per unit, and in residences where accumulators are used it would simply mean running the plant a few hours a day extra if electric-cooking apparatus were adopted.

In factories where large electric-lighting plants are in use the same argument holds good. The probability is that the generating engines are supplied with steam from the main boiler system, and the man in attendance on the general machinery is expected to look after the electric lighting plant. The cost of generating electricity during the daytime for cooking meals for the staff of the establishment, and perhaps for the employes, is in such cases almost a negligible quantity.

I must here make a small digression to call your attention to the curious ideas some people hold with regard to electric cooking. An establishment in Liverpool has just installed a large and economical plant for electric lighting purposes, and it has been proposed to the owners that they should use it during the daytime for cooking purposes. I was asked by the electric light contractors to loan some apparatus for testing, and the conditions being distinctly favorable, this was done. A little later I was informed that the committee would not adopt electric cooking. I was anxious that the test should have been made under my supervision, but it was not thought necessary for me to be present. Inquiries were made, and I found that the committee itself had superintended the experiment, and had insisted upon the food being placed on the appliances before the current was turned on. As one of the elementary rules of cooking is that the apparatus should be heated up to the proper temperature before the food is placed upon it, you will understand that such an experiment was foredoomed to failure. I relate this instance as an illustration of the common idea that electric cooking apparatus is capable of doing things which no one would think of expecting from ordinary cooking apparatus, and simply for the reason that the word "electric" is used in connection therewith. Every electrical engineer at one time or another has met with peculiar ideas of this sort.

There is, of course, nothing magical about electric heating and cooking appliances. The advantages which we claim for them are: (1) That they are more economical in point of heat utilized than any other appliances; (2) that they are quite without equal in point of cleanliness and general convenience; (3) that there is practically no waste of material in the cooking; (4) that by their means cooking is reduced to a simple science and absolutely uniform results can be obtained, this being due to the ease with which the heating effect is controlled by switching. In the oven it is usual to fix a thermometer, indicating on a dial on the front of the door, and given temperatures can be maintained within a few degrees. I might further claim that such appliances are perfectly free from such dangers as attend the use of gas cookers. Explosions are impossible, and the risk of fire is nil.

I must now beg of you to spare me a few minutes for the consideration of electric heating by radiators.

I have already indicated at the commencement of this paper that this subject requires consideration from quite a different point of view to electric cooking. Assuming for the moment that there is likely to be any large development, you will at once observe that this will bring no load to the stations during the summer time, and, owing to the large amount of current the radiators consume, they will make the winter load heavy. It may be that persons who adopt electric cooking may be inclined to use the apparatus during the summer time only, on account of its coolness in the same way as people now adopt gas ovens, returning to the use of the kitchen range in winter. If this were done to any large extent it would probably meet the difficulty, and it might even be desirable for supply companies to give special terms for the use of electric-cooking appliances in summer, and increase these charges during the winter. Whether such a plan is feasible or not will have to be ascertained as the problem develops.
